It should be the aim of all workers in wood, and especially in hardwoods, to study machinery as well as grades of lumber; to be a competent inspector of the knife-grinder, band saw or planing machine, as well as of firsts and seconds.

Too much time has been expended in the past on the lumber end of the business, leaving the machinery to take care of itself. Until methods of measuring values and of keeping records that enable one to obtain real values, are adopted, he will never be able to purchase saws, surfacers, etc., with intelligence. Men in other lines of business display knowledge in the machinery end of their calling, with the result that their proficiency in manufacturing a product is brought up to a high standard. Furniture and lumber manufacturers should get busy and follow the good example set by others.—M. B. A., in the Lightning Line.

Opportunities in the Manufacture of Flooring

The manufacture of hardwood flooring and parquetry appeals to many members of the wood-working trade because of the opportunities offered there for the use of judgment and discretion, says C. D. G., in *The Woodworker*, Indianapolis. This does not apply simply to the head of the establishment, the superintendent or the foremen, but to practically every person employed in the plant.

In a good many wood-working plants it is unfortunately true that the work which is done is largely of the same character, and while the ambitious operative will see to it that he grows as far as the limits of his job will permit, it is sometimes difficult to make much progress, in view of the narrow scope offered him in operating his particular machine.

In flooring manufacture, however, the man at the machine is constantly compelled to be on the alert. He usually has a wide variety, both of thicknesses and widths, in which to employ the material, and at every stage of the manufacturing process it is up to the employee to decide whether or not it is to be allowed to proceed without being rehandled for the elimination of defects.

The small manufacturer in the hardwood flooring business has also an excellent opportunity to make money, in spite of the fact that the large operator is usually considered to be in the chief position in this respect. This is largely for the reason just pointed out, that there are so many chances to better a piece of material here and there, so many openings for working up what might be considered waste, and so many suggestions for the wide-awake man to take advantage of. Hence the man with a small factory, who can watch the operation of its every detail, is in a position to secure all of those savings, which would be lost, possibly, in a very large establishment.

The ambitious man employed in a wood-working factory is constantly looking for ways in which to improve his knowledge and enable himself to advance. In the opinion of the writer, the flooring factory offers just such a chance, for flooring manufacturers, more than most wood-working operators, are in need of men who can use judgment and can take advantage of the possibility of working up a piece of material instead of allowing it to be wasted.

This is particularly important in this business, too, because of the fact that the materials used are expensive. Oak is the chief wood employed, as a rule, though maple is used largely. In plants where parquetry is produced, an amazing number of fancy woods is utilized to give the contrasting colors that are demanded by the intricate pattern frequently worked out. Not long ago a parquetry man displayed a sample containing twenty-seven different colors, which had been provided for the most part by the use of different woods.

This is not altogether the case, however, for flooring men have given study to the question of controlling color in wood by the use of steam. In fact, the use of the steaming retort, which is now being widely featured in connection with possibilities for drying purposes, was first brought into play in the flooring factories, where it was employed largely to change colors. Ordinarily wood that is to be darkened is left under pressure in the steam tank for about twelve hours. For instance, some mahogany lumber is not the typical dark-red

which is associated with that wood, but by subjecting it to steam pressure for the time indicated, the deeper color can be secured. The same is true of oak. A dark-brown coloring can be given oak by steaming, and this is frequently done. Cherry can be darkened, also, by subjecting it to steam pressure for a sufficient time, and it is said that the wood can be darkened sufficiently in this way to give it so close a resemblance to mahogany as to make it difficult for it to be distinguished from the imported wood, even by experts.

The use of so wide a variety of fancy hardwoods in making up flooring designs gives much of its interest to the flooring business. In addition to the woods mentioned, American walnut is also used in considerable amount, while the number of woods imported for this work is large, including teakwood, ebony, rosewood, etc. Some of the designs worked out by the use of the various kinds and shades of wood can be termed exquisite and artistic without violating the definitions of either word.

The flooring trade is one in which quality, and not quantity, is the keynote, as a rule. Talk to a hardwood flooring man about using the piecework system and you will be laughed out of court. Even suggest to him that he can increase his output to a large extent and you fail to make an impression.

"I am working with expensive material," he points out. "The main object of this business is to hold down waste and keep up the grade. That calls for two things: First, care in handling the material, so as to eliminate all defects, and discretion in cutting up the offal, so as to get as much out of it as possible. The men we have employed are selected because of their ability to do these things, rather than automatic or mechanical speed in shoving the stuff through. We want them to forget all about quantity, and turn their attention solely to quality. We are impressing upon them the fact that we have them here for what their heads contain, not what their hands can do."

The fact that the flooring factory employee is permitted to get away from the merely mechanical end of the business, and to use his brains, is a feature that ought to make the business attractive to most wood-workers, especially those looking for a chance to rise in their chosen calling.

The results of this plan are frequently seen in the statements that are given out regarding the length of time that certain men have been employed in various plants. The flooring factory hand seldom changes his place of employment; usually, it seems, because his work is interesting enough to keep him alive and alert. In a good many other lines, the man who wants to go ahead, and to become a well-rounded wood-worker, is compelled to move from one kind of work to another.

In the flooring business this is not the case. There is even a good deal of gluing-up to be done. This does not refer to the simple proposition of gluing short pieces into blocks, which are held together by cloth backing, but to specialties, such as "plank" flooring, which is much used in the construction of ship decks and floors in colonial homes. In order to get the wide flooring that was used in those days, when builders know no way to prevent their floors from warping and cupping under the stress of changing temperatures and passing seasons, without the defects involved in it, the plan has been adopted of taking a three-ply glued-up center, of ash or some other wood, and gluing the face and back to this, making a five-ply built-up piece of any dimension desired.

The back has to be of a good cabinet wood, which has a close texture, in order to prevent any great amount of swelling. As it is, the gluing up prevents this to any great extent, as the center is cross-banded, but in order to take care of any possible trouble along this line, a false tongue-and-groove connection is made, and an "expansion joint," as it might be called, of wood of the same color and texture as the flooring, is laid between the pieces. This is $\frac{1}{8}$ -in. in width, and is capable of taking up the expansion of the material without difficulty.

Speaking of the way the tongue-and-groove proposition is handled in connection with the specialty just described, it is said by manufacturers who have followed the trade for a good many years, that this kind of material is gradually losing its hold, and that thinner straight-edge stock is being put into use. Instead of 13-16-in. tongue-and-groove flooring being the leader, as it formerly was in the hardwood flooring business, 5-16-in. straight-edge material is given preference by many. It is declared that nailing down one edge of the old-fashioned variety of flooring, preventing it from expanding in that direction and forcing its movement in the other direction, results in irregularities in the floor surface, even under ideal conditions. Experiments have been made along this line which seem to show conclusively that even when extreme care is taken to get the work done right, it cannot be depended on, because of this feature.

The warehousing of hardwood flooring is a matter of prime importance. The material must be kept absolutely dry and free from moisture from the time it is manufactured until it goes down in the building where it is to be used permanently. It is drykilned before

being manufactured, and therefore takes up moisture rather readily, emphasizing the need of special care in the direction of eliminating this. A large warehouse recently erected by a flooring manufacturer has a hot-blast system of heating which maintains a constant temperature of 60 to 70 deg. in the winter time; its walls, which are of brick, contain an air chamber, further to insure dryness and to prevent moisture from getting in through the walls, which are built entirely of hard face brick, guaranteed to be moisture-proof; and under the floor is a thick stratum of cinders, with a drain pipe leading to the outside, so that accumulations of moisture can be carried off. That insures pretty nearly a dry warehouse, and one where flooring can be kept without danger of deterioration.

From what has been said the reader can possibly form a idea as to the justice of the claim which was made for the flooring business as one containing sufficient detail, and sufficient opportunity to use judgment and discretion, to appeal to the man possessing those valuable qualities.

Needless Abuse of Thin Knives

Everyone to-day knows, or at least recognizes, the thin knife as being best adapted for producing high-grade lumber. This is true of every class of wood-working. Operators are becoming better acquainted with the use of the thin knife and see the advantages over thick-knife methods. There are some, however, whom you will find complaining of knives breaking and cracking, and usually the blame is laid at the door of the knife manufacturer. In some instances, of course, this is where the blame belongs, but in the majority of cases I have found that extraordinary wear, breaking or cracking is due to incompetent handling by the operator of the machine, writes B. E. W., in *The Wood-Worker*, Indianapolis.

Four of the last eight years of my experience with these knives have been in one of the largest planing mills of the south, where most of our stock has been spruce and yellow pine. On yellow pine the thin knife has a comparatively easy job of it. With spruce it's somewhat different, and yet the knives have seemed to stand up better on the latter, for the reasons that I will mention later.

We had been running eight matchers in our plant—three of them on yellow pine most of the time. You would naturally suppose that the expense of knives would be proportionately larger on those working the spruce, for two reasons at least: that of a greater number of machines being run, and the hard, knotty nature of the wood.

On the contrary, the knife bills on the three machines amounted to 8 per cent. more than that of the five. Where was the trouble? The knives had not been worn out. They had, however, been cracking and breaking quite frequently.

Upon investigation I took into consideration the fact that different methods of grinding were being used. Some machines required the removal of the knives for sharpening; others remained right in the heads. In either case, however, the operators never expressed the desire of sharpening more than they deemed absolutely necessary and still keep the finish of the stock passable by the inspector. And here was the chief cause back of all our knife trouble.

When the knives were clamped on the automatic grinder, the self-feed was set, the biggest possible cut was taken to grind the knife evenly its full length, and the whole job hurried as much as possible. This should not be. The attendant should examine his stone to see that it is clean-cutting, whether the feed is too heavy, and that not too heavy a cut is being taken. By taking a heavy cut the knives are brought to a red heat, and naturally the steel expands. A sudden contraction causes the knife to crack or leave a hair-like crevice in it, hardly visible to the naked eye.

This same thing can be caused by the small grinder used for sharpening the knives right on the machine, although the tendency is not so great.

Another cause of cracks, especially when using the back bevel, is allowing boards to remain stationary under cutter while running. This blues the thin edge of the knife, besides being detrimental to grade, as it leaves a black mark across the face of the stock.

With ordinary care and watchfulness thin knives will last twice as long without ever cracking or softening, and the wearing qualities are usually dependent upon the conditions under which they operate.

Sanders and Economical Sandpaper

Makers of sand and garnet papers have done all we can reasonably expect of them in perfecting the cutting and lasting qualities of their various papers, says Berlin Quality. But nobody has as yet put out a paper that will economically accomplish what some operators and their employers try to force sand papers to do.

It has never been explained to the writer just how some users figure that it is cheaper to cut out the surfacer in the finishing of wood and compel the sander to act both as a surfacer and as a finishing

machine. All of us know of sanders being compelled to take off 1-16 inch even an $\frac{1}{8}$ inch without the help of the surfacer at all.

Now, as a matter of fact the machine itself will stand such a cut for a long time; but where in the world is the economy of such work? As we said in the first paragraph makers of sand papers have not yet perfected a paper that will economically make such cuts.

To do sizing on the sander requires fresh paper to be applied very frequently, and good paper costs money, while the poor ones won't do the work at all. Also changing paper takes time and costs money.

Even counting the cost of an additional operation doesn't it strike the average operator that clean surfacing would greatly aid in not only getting a finer finish, but in securing it at a more legitimate cost?

In order to make such cuts as we often hear of operators making the coarsest papers are required. Probably the paper on the third or so-called "polishing" drum, would not be finer than No. 1, and in order to get down to a proper polish, stock would have to be run through a second time. Whereas with good surfacing finer papers, even as fine as No. 0 might be used and a good finish secured at a much lower cost.

Take the matter of sanding doors. Very often on cheaper doors, the stiles will be a full 1-16 inch or even $\frac{1}{8}$ inch thicker than the rails, or vice versa. The sander is supposed to cut them down to proper thickness. But—not more than 50 doors can be cut with one set of paper doing such work. That isn't economy; it is only a useless attempt at cutting out one operation.

It is our belief that the better and more economical way would be to surface door stock to within 1-32 inch of caliper size, and allow the sander the 1-32 inch to clean up and polish the door.

If stock comes of very uneven thickness, sort it. The inspection will pay for itself, and will also cut working costs to a minimum.

This may seem like extra work and increased cost; but we venture to say that proper inspection always pays for itself, in better grades. And as for delay in getting doors through with more careful surfacing and inspection, it is very doubtful if it would not result in less actual time consumed in manufacture than the more careless unsystematic method now in use in some factories.

Don't overestimate the ability of the sander to undo all of the results of careless sizing and surfacing. To be sure the sander can do it, is doing it to a large extent; but not economically.

Remember that while the sander runs through possibly 15 feet per minute and does "pretty good work," modern surfacers both single and double run ten times as fast doing most excellent work, helping towards the finest finish obtainable on any wood you use. And if any delay does result through closer attention to the sizing and surfacing operations, the added price obtainable for a better product will more than cover up any added expense.

Successfully Handling Employees

In manufacturing plants of almost every kind one may often hear the remark, "Here comes the boss; get to work," from a man who has been leaning up against the wall smoking, and who immediately starts to work with a vim when he sees the boss coming. Those of you who are interested in the bettering of the mill man's condition, and, as an ultimate result of this, the standard of work, had better watch out for such a man and get him out of the shop as soon as possible.

Such a man is simply a parasite, bent on getting the best money for the smallest amount of work possible. In the office on Saturday night he grabs for his pay envelope, with the remark that he is so glad that tomorrow is Sunday, for he is almost all in. If he could only realize how true this remark is! Sooner or later he is bound to lose out, and then blame his employer for not giving him a chance to do better.

I wish to give the readers of *The Wood-Worker* some facts relating both to the successful and unsuccessful side of planing mill life, with regard to such men as the one just mentioned. Many men of this type are good workmen, but never have the ambition to brighten up and do better. The thing for us to do is to give them the needed encouragement. Then there are other types of undesirables that will be discussed later in the article.

Ed Boyle went to work for Brown & Simpson at the age of sixteen. He was chock full of ambition and intended to soon do better. But there in the mill he fell in with some of the older men, just like the one described before, and consequently his work was neglected. Now, Ed's employer had noticed that he was a little sharper and quicker to apprehend a situation than most of the fellows, so when he saw that Ed was losing out, he called him into the office and explained things to him. He told him that there was a higher position and a bright future in store for him if he would attend strictly to business. Well, the higher position was given, but it did Ed very little material good. In three months he developed the worst case of "big head" imaginable. He knew more about the business in that time than his employer had learned by thirty years' rough experience.

This man saw, however, that Ed was an especially good workman,

and he let him have his own way as long as possible. But one day, while Ed was having some stock molding stored away, the boss came through the mill. He walked up to the men and told them that they should place the molding in face downward, so that it would not catch all the dust. But Ed, thinking he knew best, told the men to continue in the old way. Well! what that boss told him in five minutes would fill a good-sized writing pad, and in ten minutes Ed had no job. Now what was the matter? Was Ed to blame, or his employer? He was a bright, honest young fellow when he went into the shop. The trouble was, the influence that the older employees and their talk had on him. Keep such men out of your shops and watch the change in the attitude of the men really worth something.

Of course, one cannot always tell how a man is going to turn out when he is hired, but after several years' experience one can acquire the judgment that will usually be correct. I have had men apply for a position that were so nervous they could hardly sit in their chairs, and, if given a position, it would be several days before they could get into their regular stride. But I have found that such men usually make good workmen. The self-possessed, overconfident fellow, however, usually thinks he knows more about the business than any other person around the place. And beware of the man that comes around with a huge bunch of recommendations, for as a rule he is positively of no account. Such men never stay more than a week or two in any one place, maybe just long enough to get a recommendation.

Several years ago the writer was working in a large mill in a western city. The concern was in need of a stock-cutter, and several had been tried, but all had failed to meet the requirements. The superintendent was in despair. One day he sent for me to come to the office, and when I entered he said: "Peetz, do you know that man?" I turned and looked, and of all the broken-down specimens of humanity that I had ever seen, this was the worst. He came toward me and said with a grin: "Don't you know me, Peetz?" The voice sounded familiar, but I couldn't recognize the face beneath all that hair and dirt. "Well, I'm George ———," he said. I was completely dumfounded. Two years before that man had been a refined and respected citizen, and also one of the best stock-cutters in the largest mill of the state.

He didn't look very promising, but the superintendent was willing to try him as a last resort. I was sure that if George was given the chance he could brighten up, so I offered to pay out of my own pocket if he didn't make good. In ten minutes he had his time card, and went to work as soon as the superintendent had finished giving him instructions. Then I went to the superintendent and asked him not to give George any further instructions unless he asked for them, telling him that unless I was badly mistaken that man with the long hair and those ragged overalls would open their eyes. And, believe me, George more than made good, and when I left there he was making good money, had married, and was living a clean life.

Now what would have happened if this superintendent had waited for recommendations? He would have lost a good stock-cutter, and, moreover, would have lost the chance to save a man. But when he saw that there was something good in this wretched creature, he played the humane part and gave him a fair and square chance, encouraged him in his struggle for a better existence and made him ashamed of his past life. Some employers wouldn't have given George a second look, let alone a position. If these men would treat employees as if they were respected friends and not part of a huge machine, they would find there would be a much larger dividend at the end of the year, and they would not have to increase the size of the plant to do it, either.

The writer has a friend who is foreman of a large woodworking plant in his home city. Of course, we meet quite frequently, and our conversation naturally turns to shop talk. During one of these talks I said to him: "Charlie, what do you consider your greatest drawback when you have several rush orders on hand? I mean in getting out the work rapidly?" He hesitated a moment, then said slowly: "Too much proprietor. It will explain itself, Peetz. Of course," he continued, "I don't believe in shop gossip at all, but in confidence I will tell you the whole situation. You already know that most of our work is piecework. That is, in my cabinet room, where we have twenty men and boys at work on the different lines of stock and special work that we make. On our stock work we have a standard price, but on our special orders we give one case to our best man to make at day work, so we can get a fair idea on which we base our piecework. Now here is where the proprietor gets in his work. Suppose Brown, our best man, has completed a 6-ft. case of a special order, at a cost of \$8.50. This Brown is a good workman, first-class in every respect. The boss, having Brown's time to judge by, always figures that a man can gain one case in ten by finishing up the ten all at one time. So, when the work is distributed among the rest of the workmen, he makes a price to them of \$6.75.

"Now, bear in mind that the sample was made by a fast, neat mechanic, and we all know that where one good, fast workman is

found there are nine or ten bad ones. Suppose we have forty of those cases to make. I give ten each to our four best men, Brown not included, of course. Two of these men make \$2.50 per day, the other two \$1.75. They are all first-class, of course, but the latter two are not so speedy and quick to take advantage of the small things that would help them along. After their piecework checks are turned in at the office and the boss discovers the difference in the time of the men, he grows very angry and feels that the work is being slighted. He generally starts out: 'Why, Meyer, if all the men in the shop were as slow as you and Mopper, I wouldn't be able to raise enough money to pay off on Saturday! Why, man, I could take a hatchet and saw and get the work out quicker than you do!' Then, in a few days, thinking he will get better results, he starts out on the other two men, trying to hurry them up. The real result is a constant turmoil in our shop, the men talking against the boss and always fearing that an unjust tongue-lashing will come their way.

"Of course, no man stays in a place like this any longer than he has to, and new men are always coming and going. About the time I have taught a new man our ways, he quits or is fired. Peetz, you know my employer will never get good results from the tactics he pursues. If he would make his complaints, and make only just ones, in a nice, gentlemanly sort of way, talking to the men as if they were human, there would be a better understanding between he and them and the men would stand by him during a rush order. Then this employer of mine has another fault: The minute a man comes into the mill he either takes a sudden liking or dislike to the new man. And if he takes a dislike to the man he has him fired without waiting to see what sort of a workman he is. So I'm up against it, Peetz."

I believe this foreman is responsible, partly, for this state of affairs. If he allows the employer to rule him so unjustly, the men will soon lose their respect for him, and there will then be a worse state of affairs. But there are some employers who can't let well enough alone and will tear down every good move that a foreman makes—and then they wonder why profits fall off. Of course, I don't mean that they are all this way, for there are many who will give foremen the rights they really should have. But there are many who would not hire a foreman that would stand up for his own and the men's rights. They want some one upon whom they can vent their wrath when anything whatever goes wrong.

Men of experience in superintending others all agree that the worst thing to do is to "bawl out" a man before the entire mill force. It makes the men sullen and unwilling to work as they should, and it also lowers the dignity of the foreman. If a man makes a mistake he should be corrected in a nice, quiet way that leaves no sting behind it.

In order to prove further that the golden rule is indispensable in planing mill management, I wish to give the readers of this another incident which happened in a large mill in the north. The firm is an old one, and employs thirty-five or forty good mechanics, some of them having worked there for over twenty years, and the foreman some seventeen years.

There had always been a fair margin of profit made, until, very suddenly, the profits began to drop off. The proprietors grew restless over the situation, but could come to no definite conclusion as to the cause. After letting matters take their usual course for some time, they decided to employ a new foreman, and hired a young man about thirty years old. When he arrived they explained the situation to him. He asked one question: "Am I to be boss or just a figure-head?" They told him they would give him entire control of the mill for one month, and if he was satisfactory he could have the place permanently. That foreman was just three days in finding out the trouble. The old foreman had gotten cranky, had tried to bulldoze the men and make them understand that he was their superior.

The new foreman made the men feel, in the beginning, that he was just their helper and adviser, not their master. He made them feel that they had a great part in carrying on the work of that mill. In the hot months he gave them Saturday afternoon off, and the proprietors claimed they got as much work done on Saturday mornings as they had all day before. That foreman could go to his men and say: "Boys, we have secured a contract at a low margin. Now do your best." He always got what he asked for.

A foreman should encourage his men when they take interest in their work. By all means get rid of the type of men that ruins the spirit in a shop. If an employer takes this course I am sure he will never have to advertise for men, and he will never hear the remark: "Cheese it, here comes the boss! Get to work!"—L. M. W., in *The Wood-Worker*, Indianapolis.

George C. Fairchild, formerly of D. P. Fairchild & Company of Oswego, N.Y., and well known in the New York State lumber trade, has become general manager of the spruce operations of the P. O. Viall Lumber Company at Port Daniels, Quebec. The product of this company is handled in the United States by the A. Sherman Lumber Company of Potsdam, New York, and New York City.

C. P. R's. Ogden Woodworking Plant

Layout and Equipment Planned According to Latest Ideas—Many Unique Features Assisting in Production of Good Work

One of the most interesting planing mills in Canada is that of the Canadian Pacific Railway at Ogden, Alta, illustrations of which are published herewith. The mill is located between the coach shop and the freight car shop operated by the C.P.R., and is a building 303 feet by 80 feet, fitted with the most up-to-date woodworking machinery used in car repair and general work. All machines are fitted with vacuum exhaust tubes for carrying away shavings, etc., the fan for which is driven by a 100 h.p. motor which delivers the shavings to a boiler in the power house, which is specially designed for burning them. The layout of machines is arranged so that material will not have to be handled more than is absolutely necessary. Rough material enters at the east end and leaves finished at the west end, which being closest to the freight car shop saves a lot of unnecessary labor. The shop is traversed, as will be seen by the plan, by two sets of 20-inch gauge industrial tracks, comprising a standard gauge track. A turn-table is placed in the centre so that lumber can also be brought by side doors, if so desired. These tracks are supplied with suitable trucks which can be run alongside most of the machines, saving a lot of delay and unnecessary handling of material.

Machines Driven By Individual Motor

The machines are mostly individual motor driven, except a few small ones which are group driven. Most of the machines are of American make and were supplied by the J. A. Fay & Egan Company, Cincinnati, Ohio, some were also supplied by the Cowan, Limited, of Galt, Ont., the Berlin Machine Works, Limited, Hamilton, Ont., and the Canadian Machinery Corporation, Limited, Galt, Ont.

The motors were supplied by the Canadian General Electric and Canadian Westinghouse Companies.

The accompanying illustrations show the positions of the various machines and their maker's names. It will also be seen by the plans that the lumber storage is well equipped with tracks and that cars of lumber can be run into the mill to load and unload lumber if so desired, and every convenience is provided for the handling of material at the minimum cost.

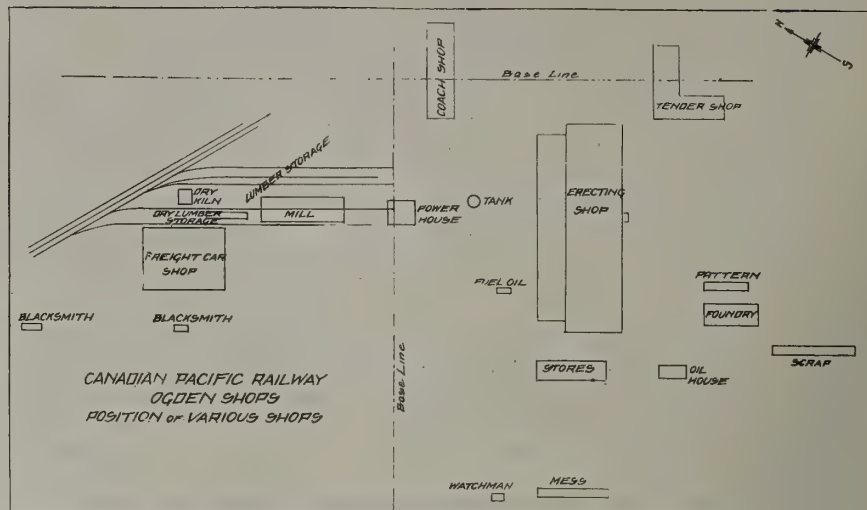

The shop is heated with hot air, driven by Sturtevant fan, distributing the heat to various positions in galvanized pipes. A high-pressure air line is placed conveniently so that connections can be made close to machines for cleaning them by air pressure, as well as affording a source of power to carry out any repairs that may be necessary. The southwest corner of the shop is provided with benches where the carpenters can work. The central portion is equipped with an overhead monorail to remove any large pieces of lumber when necessary. These are fitted with Pilling air hoists and are remarkably handy.

The switch and fuse boxes are placed in convenient places and well protected from dust, etc., at the same time being accessible by the operator.

Interesting Equipment Details

As most of the lumber comes direct from British Columbia points, it has to be dried before using, and a large dry kiln is used capable of drying 100,000 feet of lumber. The kiln is ventilated and heated in the most modern style.

The artificial lighting system of the plant is composed of numerous 100 candle power incandescent lamps, plug boxes are placed in handy positions so that extensions can be taken from them.

The floor of this shop is laid in mastic, which makes it very warm and comfortable in winter, as well as affording an easy footing.

Ambulance and first aid cabinets and a stretcher are placed in a central position and competent first aid men are in charge of them.

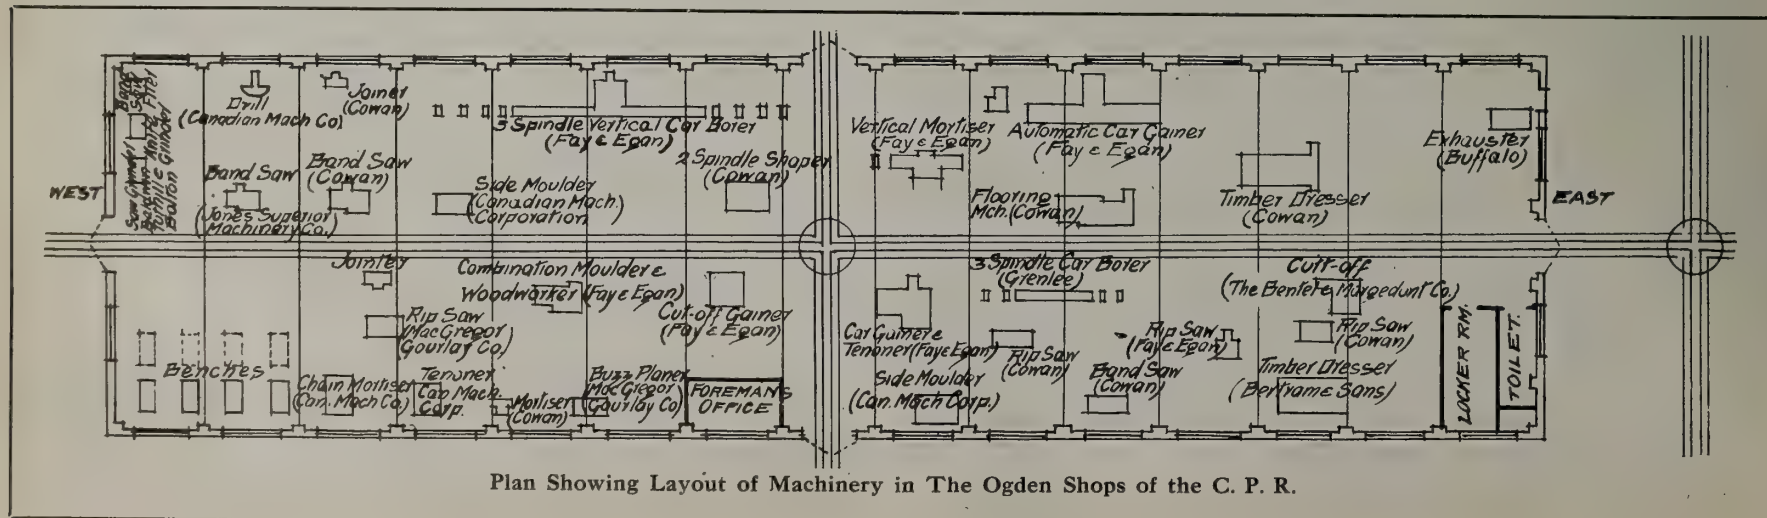

The foreman's office is 18 feet by 20 feet and placed near the centre of the shop where a good view of shops can be obtained.

The shop is well equipped with wash lavatories and closets, and men are provided with steel lockers for their clothes, etc. The windows are all adjustable and thorough ventilation is assured. The shop is fitted with automatic hydraulic fire alarm system working in conjunction with sprinklers, which, with plant fire brigade and watchmen's clocks as distributed about the mill and lumber yard render fire almost an impossibility. Throughout the shop all machines are carefully fenced so that all dangerous gearing is protected.

Taking this shop on the whole, nothing has been left to prevent the greatest output at a minimum cost, and after several months' operation it has been found that the machines are giving the greatest satisfaction.

B. C's. Forest Act Amendment

Hon. Wm. R. Ross, Minister of Lands for British Columbia, recently announced a series of hearings for the presentation of information and views in connection with the government's policy for the collection of royalty upon Crown timber. At the last session of the provincial legislature a proposed readjustment of the royalty was presented to the House. A representative committee of lumbermen then conferred with Hon. Mr. Ross and the proposed amendment was discussed in detail. A tentative agreement was reached, but it was decided to take no definite steps until a fuller investigation had been held. The recent series of hearings was the result of this decision. The meetings were announced for the following places; Vancouver, September 8; Kamloops, September 9; Revelstoke, September 12; Cranbrook, September 15. In addition to these hearings, lumbermen have been invited to submit their views in writing. Upon the information thus obtained, the government will base the amendments to the forest act which it intends to introduce at the forthcoming session of the legislature.

Plan Showing Layout of Machinery in The Ogden Shops of the C. P. R.

The Various Uses of Birch

Editor Canada Lumberman:

Syracuse, N.Y., August 26th.

I often notice that you mention the different things that birch is used for, but you do not say whether it is red, white or yellow birch. It would be of great value to your many and long time readers if you could give an idea of the different kinds of things that white and yellow birch are used for—also if you could say whether white birch is good for making paper, the same as spruce is and by what process. There are large quantities of white birch along the north shore of Lake Superior, as well as in many other districts, which are accessible by water for shipping. Yours truly, C. H. CLARK.

The Director of Forestry at Ottawa, states that manufacturers in sending in statistics regarding their operations, seldom distinguish the different kinds of birch, except hard and white birch. The majority of birch used in Canada is black birch (*Betula lenta*) and yellow birch (*Betula lutea*) and is used for furniture, flooring, vehicles, etc., while white birch (*Betula papyrifera*) is used for spools and small turnery.

White birch is not used for paper-making in Canada, although it has been used for this purpose in the United States.

Mr. H. H. Gibson, editor of *The Hardwood Record*, in his recently published book on "American Forest Trees," states that the wood of black birch is heavy, strong and hard. Both black birch and yellow birch, he says, are put to similar uses—flooring, interior finish, furniture, etc. Black birch is used largely for various parts of vehicle manufacture, particularly for wagon parts and frames of automobiles. It is also much used in making sleds, boats and handles.

Speaking of yellow birch the same author says that vehicle makers use it for its strength and elasticity. In the north it is manufactured into frames for cutters and sleighs of all kinds. Hubs are made of it for horse-drawn vehicles, and its hardness gives long wear where the spokes are inserted. Manufacturers of automobiles have tried out yellow birch as material for frames; it has stood the test and is much used in competition with other woods. Large amounts of yellow birch are used for packing boxes, crates and shipping containers for which the low grades are suitable. The logs are cut in rotary veneer for baskets and ply-work. Some of the veneer in three-ply is worked into high class commodities, such as seats and backs of theatre chairs. Birch flooring competes closely with maple in popular favor. It goes into all kinds of interior house finish from floor to ceiling.

The more common commodities manufactured of yellow birch can be listed only in groups because of their great number. Novelties constitute a large class. One of the earliest demands was from manufacturers of pill boxes. Millions of birch hoops are still produced annually in the United States, but all of them are not of the yellow birch species. Birch broom handles have been in use for many years. They are made of all the commercial birches, but yellow birch contributes a large part. Other handles are manufactured of it also, such as those which are fitted to hand saws, planes, drawing knives, chisels, and augers.

Ontario's Crop Reports Encouraging

The August crop bulletin issued by the Ontario Department of Agriculture, says that the season of 1913 will be remembered as one of the most favorable for the harvesting of hay and the cereals. The former was never handled in more perfect weather, and grain crops, so far, have stood up well for cutting and have been housed under perfect conditions. The promising outlook for the fall wheat crop, described in the May bulletin has been realized. The average yield per acre is large—although there is considerable range in individual returns even in the same counties—while the grain is generally classed as a good sample. The average yield of spring wheat—confined largely to the eastern half of the province and the newer districts of the north—is a good one and the sample is well spoken of. Apples appear to have suffered considerably from the frost during the month of May and the subsequent dry weather. It is generally reported that the yield will be about half the normal. The forecast shows a probable production of 15,835,814 bushels of fall wheat from 646,533 acres, an average of 24.5 bushels to the acre. In 1912 the production was 15,039,885, an average of 19.8 bushels per acre. The average for the thirty years from 1882 to 1912 was 17,778,243, being a yield of 21 bushels per acre.

The Dominion government has recently passed an order-in-council, the chief object of which is to give small sawmill operators an opportunity to obtain hydro-electric power. The order gives the Minister of the Interior authority to lease water power in forests, reserves or parks, so long as the development does not exceed 200 h.p. at low water level. These leases may be made for ten years renewable at the discretion of the Minister.

B. C.'s Forest Protection Arrangements

The Forest Branch of the Department of Lands of British Columbia is undertaking a work of great magnitude in improving the facilities for reaching fire outbreaks in the forests, with the least possible delay. There are now 50 trails on which work is proceeding, while 10 telephone lines have been approved, 8 of which are under construction. The average timber acreage in charge of each fire warden is approximately 300,000 acres; in other words a tract of 5,000 square miles, being a territory 100 miles long by 50 miles wide. Obviously it is of importance in increasing the efficiency of the patrol work to provide methods whereby the news of fires can be obtained as soon after their outbreak as possible. At present in the timbered tracts of the province there are no telephone lines, because they would be commercially useless, and it is to supply this deficiency that the forest branch is installing lines of its own at points where there is the greatest danger of fire; that is, where settlers, tourists, construction camps, etc., are to be found. These telephones are connected up with the nearest settlement. The forest protection work does not interfere with commercial companies.

The freedom from forest fires throughout British Columbia this summer, as a result of wet weather, has enabled the fire wardens to make a special study of the different sources of fire danger, with a view to introducing still further preventive measures. Efforts are being made to get all owners of timber limits to dispose of their slash this autumn. The Forestry Department will give its aid wherever possible.

Want Canadian Timber Used

A deputation representing British Columbia lumber manufacturers, waited on Hon. J. D. Hazen at Vancouver recently and asked that Canadian grown timber be used exclusively in the various harbor and dock improvements being and about to be carried out in the Dominion. The minister in reply expressed himself in sympathy with the request and stated that he would submit the matter to his colleagues. The members of the deputation stated that the omission of a clause in the specifications providing for the use of Canadian timber might result in the substitution of American grown timber bought in the United States, where the lumber trade is stagnant and where ruinous prices prevail. It was pointed out that the loss of this business to Canadians would be an injustice, as government contracts called for the use of over 400,000,000 feet within three years. Another similar deputation presented the same facts before Hon. Robert Rogers at Victoria.

Large Timber Scarce in Northern Alberta

It had been reported that there was considerable large timber north of Lac LaBiche, in northern Alberta, but an examination by Mr. S. H. Clark for the Forestry Branch of the Department of the Interior, brought out the fact, which has too frequently been the case, that the quantity of large timber is small and only in a few scattered areas. There is, however, a large quantity of immature spruce and jack pine which needs only protection from fire to be a valuable crop from pulpwood or lumber. The land is generally covered with muskeg, and the soil nowhere first-class, becomes lighter and sandy towards the east, where it consists of sandy jack pine ridges with muskeg between. The undrained muskegs make the timber growth slow, but the whole district is more suited for timber growth than for agriculture.

The door plant recently erected by the Canadian Western Lumber Company, Limited, Fraser Mills, B.C., is now running and the company expect in the near future to be offering their product in eastern Canada. Wherever the fir door has made its appearance it has rapidly obtained popularity and it may be confidently counted upon to become an important factor in the door trade of eastern Canada. Fir trim makes a beautiful interior finish and will take any stain or paint.

Washington Mills Reduce Output

A despatch from Aberdeen, Wash., states that the West Coast Lumbermen's Association decided to reduce the output of their mills by one-third from September 1st, owing to dullness in the lumber market. Thirty mills in western Washington and Portland were represented and it was expected that all the large mills in the Northwest would co-operate. Most of the mills will work only four days each week. Members were of the opinion that this reduction would improve the situation within ninety days.

I. B. Pendleton will be manager of logging operations to be started near Powell River by the Haslam Lake Timber & Logging Company. The plan is to construct eight miles of railway this season.

Early Days in Quebec Timber Export

An Outline of the Rise and Fall of a Great Industry—Prices and Contract Forms of the Middle of Last Century

By Edward Harper Wade*

THE earliest available records of the export business of the Port of Quebec are those for the year 1845, though possibly earlier statistics may be in existence. The first Ottawa raft of square timber arrived in Quebec in July, 1806, and within nine years of that date the timber trade of the Ottawa was firmly established. The Hon. John Egan, known in the trade as King of the Ottawa, took a leading part in its development, having controlled the manufacture in one year of nearly one hundred rafts of timber for the Quebec market. At a somewhat later date Mr. Alexander Fraser operated very largely for many years. Both these pioneers of the Ottawa Valley timber trade are worthily represented in the present lumber business by their respective sons, Mr. H. K. Egan and Mr. J. B. Fraser with his brother Mr. W. H. A. Fraser.

Early Days of the Pine Timber Trade

No doubt before Ottawa rafts come down at all the white pine of the Province of Quebec was hewn into square timber and shipped to England. There is an old story of two little vessels arriving in the Saguenay for timber, to find the wood intended for their cargoes still in the forest unfelled, but within the thirty days allowed for their loading, the timber was hewn, drawn to the water and shipped, both vessels sailing without a demurrage claim. The ships were probably 200 to 300 tons register, and consequently did not require large cargoes, still the story shows how abundant and readily available white pine then was in a district that now only produces spruce deals. The Breakey mills on the Chaudiere River near Quebec and the King mills at Lyster in the Province of Quebec, produced excellent pine deals as recently as the seventies in last century, and all the pine on the St. Maurice and its tributaries is not cut away even now.

In 1845 the wood goods exported from Quebec consisted of the following assortment:

White pine	15,828,880 cubic feet
Red pine	5,182,320 cubic feet
Oak	1,397,440 cubic feet
Elm	1,423,920 cubic feet
Ash	207,080 cubic feet
Birch	183,360 cubic feet

Square hewn timber	24,223,000 cubic feet = 290,676,000 ft. B. M.
Pine deals	3,200,015 Que stds. = 88,006,512 ft. B. M.
Spruce deals	527,259 Que stds. = 14,499,623 ft. B. M.

Total export of timber and deals 393,182,135 ft. B. M.

There is no record in 1845 of any export of hewn tamarac or of lath wood, but probably this was an omission, as in 1846 an export return of 771,489 cubic feet of tamarac appears, and also one of 5,007 cords of lath wood, principally hemlock. In 1845 the shipment of pipe and puncheon oak staves amounted to 5,181 mille.

Earliest Timber Price Records

The earliest price records given below are for 1847, and are given in the Canadian currency of that time, the pound currency being the equivalent of four dollars, and three pence that of five cents. The prices are per cubic foot for timber, and per Quebec standard hundred of 2,750 feet board measure for deals. Pipe staves sold at per standard mille, based on 1,200 pieces of 5½ feet long by 1½ inches thick, and puncheon staves at per mille of 1,200 counted pieces.

Deals piled direct from the saw were called "bright" in contradistinction to floated.

Price Records for 1847

White pine 3 to 5 pence, equal 5.00 to 8.33 cents per cubic foot.
Red pine 6 to 9½ pence, equal 10.00 to 15.83 cents per cubic foot.
Oak 14 pence, equal 23.33 cents per cubic foot.
Elm 5 to 8 pence, equal 8.33 to 13.33 cents per cubic foot.
Ash 4 to 6 pence, equal 6.67 to 10.00 cents per cubic foot.
Tamarac 6 to 7½ pence, equal 10.00 to 12.50 cents per cubic foot.
Bright pine deals, first quality, £10 10s to £11, equal \$15.27 to \$16 per M. ft. B.M.
B.M. Second quality, £7 to £7 6s 8d, equal \$10.19 to \$10.66 per M. ft. B.M.
Floated pine deals, first quality, £9 to £9 10s, equal \$13.09 to \$13.82 per M. ft. B.M.
B.M. Second quality, £6 to £6 6s 8d, equal \$8.73 to \$9.21 per M. ft. B.M.
Spruce deals, first quality, £8 to £8 10s, equal \$11.64 to \$12.36 per M. ft. B.M.
Pipe staves, merchantable, £30, equal \$120 per standard mille.
Puncheon staves merchantable, £8, equal \$32 per standard mille.

Edward Harper Wade.

Lower prices for white pine were not recorded at any later date, but red pine sold at 4½ to 8 pence, equal to 7.50 to 13.33 cents in 1848 and 1849; oak at 12 to 14 pence, equal to 20 to 23.33 cents in 1849; elm at 3 to 6 pence, equal to 5 to 10 cents in 1848; and ash at the same figure in 1848, 1849 and 1850. Staves steadily advanced in value, but first quality bright pine deals in 1848 and 1849 sold at £9 to £9 10s., equal to \$13.09 to \$13.82 per thousand feet board measure, and first quality floated pine deals in same years sold at £8 to £8 10s., equal to \$11.64 to \$12.63, with second quality at the then customary price of two-thirds that of first quality in both bright and floated pine deals. The circular of 1859 gives the English specification as 12 and 13 feet long, eight-ninths 11 inches broad and upwards, and the then price piled at the mill as £15 for firsts, and £10 for seconds were worth £2 to £3 more, and first quality board measure, but added that half firsts and half seconds were worth £2 to £3 more, and first quality alone at £3 to £5 more.

A very usual English contract specification at one time was not over one-ninth under 11 inches and not over one-ninth under 12 feet, but later on as

wood became more valuable and smaller saw logs were cut, the recognized average specification became in first quality 65 per cent., in second quality 70 per cent., and in third quality 75 per cent., of 12 feet and upwards by 11 inches and upwards, remainder 10 feet and upwards by 7 inches and upwards, and this was sold at a price for firsts, with seconds at two-thirds and thirds at one-third, with a reduction on surplus deals under 12 ft. by 11 ins.

The lowest recorded value of spruce deals was in 1849 at £5 to £6 currency per Quebec standard hundred for first quality, equal to \$7.27 to \$8.73 per 1,000 ft., B.M. In 1859 they stood at £8 for firsts, £6 for seconds, and £4 for thirds, equivalent to \$11.64, \$8.73 and \$5.82 per 1,000 ft. B. M.

How timber and deals were produced for such prices as those recorded, it is now difficult to understand, but standing timber had only a nominal value, wages were very low, money was scarce and expenses were light. Canada had to compete with the Baltic production, with similar conditions and much lower ocean freights, and the Baltic woods were known too and specified by architects. White pine only slowly won its way to favor, as its intrinsic merits were by degrees realized. In 1847 red pine, as being similar to the Baltic red wood, was worth nearly twice as much as white pine for much larger average size, and it was not till 1866 that red pine and square white pine were quoted as equal value in the raft viz., 6 to 12 pence currency, equal to 10 to 20 cents per cubic foot. Wane white pine, when first made in 1861 sold for no more than square red pine of the same year's manufacture and much smaller cubic average. So much for prejudice.

As far back as 1875 the J. Bell Forsyth & Company circular noted the decline of the export wood trade in the following words:—"In 1865, 27,610,960 cubic feet of hewn timber of all kinds were shipped from the Port of Quebec; in 1870, 21,445,880 feet and in 1875, 14,933,120 feet, showing a great decrease in ten years. Nor has the export of deals increased as largely as might be supposed, for the quantity was 5,870,580 Quebec standards in 1865, 6,381,441 in 1870, and 6,334,182 in 1875. Looking back to 1845, we find the largest shipment of timber to have been in 1863, when it was 32,392,400 feet and the minimum in 1875, when it only amounted as named to 14,933,120 feet. Deals, pine and spruce together, during the same time, reached their highest in 1874, the export being 7,831,155 Quebec standard, and their lowest in 1856 when the export was 3,242,963 Quebec standard. A cubic foot contains 12 feet board measure, and a Quebec standard 27½ feet board measure. In 1912 the hewn timber export of Quebec, which was as follows, contrasts with the similar table for 1845, sixty-seven years earlier.

White pine	1,192,819 cubic feet
Red pine	10,953 cubic feet
Oak	396,775 cubic feet
Elm	391,880 cubic feet
Ash	938 cubic feet
Birch	160,788 cubic feet

Hewn timber 2,154,153 cubic feet = 25,849,836 ft. B. M.

*President of the Harper Wade Export Company, Quebec, P.Q.

The export of staves came to an end in 1891 and that of lath wood in 1887, both having previously dwindled to insignificant figures. Staves are now shipped to the United Kingdom from the southern ports of the United States, and lath wood from the Baltic ports. Pine deals are no longer shipped from Quebec, but a diminished export trade continues from Montreal in the sawn white pine production of Ottawa and western mills, more largely in boards and sidings than three-inch deals. No reliable statistics are available. Spruce deals are shipped very much more largely from places on the St. Lawrence below and above Quebec than from that harbour, and quantities are not published.

In comparison with the prices of 1847 we give below in same manner those for 1912, sixty-five years later.

Square white pine, 30 to 55 cents per foot.
Waney white pine, 80 to 93 cents per foot.
Red pine, 35 to 40 cents per foot.
Oak, 65 to 73 cents per foot.
Elm, 40 to 45 feet average, 85 to 93 cents per foot.
30 to 35 feet average, 65 to 75 cents per foot.
Birch, 16 inches average, 30 to 31 cents per foot.
Bright pine deals \$180 to \$220 for firsts equal \$65.45 to \$80 per 1,000 ft. b.m.
\$110 to \$130 for seconds equal \$40 to \$47.27 per 1,000 ft. b.m.
\$60 to \$80 for thirds equal \$21.82 to \$29.09 per 1,000 ft. b.m.
Unsorted spruce deals, 9 in. and upwards, \$18 to \$20 per 1,000 ft. b.m.
7 and 8 inches \$15 to \$17 per 1,000 ft. b.m.
4 to 6 inches \$14 to \$16 per 1,000 ft. b.m.

It would be interesting to give particulars of recent contract prices in sales for the United Kingdom, for comparison with those of some old contracts which are published herewith, along with an old cargo invoice and an ancient price list, but both buyers and sellers object to figures and particulars being at present made public. Prices at the end of 1912 were at the highest recorded figures, and such extreme values, while they may be fully justified and indeed necessary if production is to continue, are telling on the export trade, as the importers in the United Kingdom are driven to try substitutes in cheaper woods and other material.

The tonnage loaded at the Port of Quebec in 1845 was 1,475 sailing vessels, aggregating 559,712, and averaging 380 tons register. In 1865, twenty years later, it was 1,021 sailing vessels, aggregating 646,115, and averaging 632 tons register. In those days white pine was the common building wood of Great Britain, and every little port brought in its cargo. Such small vessels are now almost unknown in the Atlantic trade, where indeed sail is almost altogether replaced by steam, and the smaller ports draw the bulk of their wood supplies from the larger ones.

In 1861, the vessels that loaded in Quebec were still very largely British as shown below:

	Vessels	Tons
British	1,148	689,677
Norwegian	136	57,840
American	46	48,863
Prussian	20	6,425
Others	14	6,498
	1,364	809,303

The following invoices and contracts of early days are reproduced in order to afford a good idea of the business methods, prices, etc., which prevailed at that time.

A Quebec Invoice of 1844

Invoice of a cargo loaded at Quebec 16th August, 1844, shipped by Henry W. Welch, of Quebec, on board the Brig "Hope," T. Middleton, Master, for Maryport, England, purchased by Captain Middleton, for account and risk of Isaac Middleton, of Maryport, and to him consigned.

15 pieces Rock Elm, including 6 pieces 40 feet and upwards long, 645 ft. 2 in. 2 pts., 8½d. £22 16s 11d.
8 pieces Canadian oak, including 6 pieces 40 feet and upwards long, 425 ft. 5 in. 11 pts. 15d. £26 11s 10d.
8 pieces Red Pine, 45 feet average cube, 336 ft. 10 in. 5 pts., 9¾d, £14 15s 7d.
35 pieces White Pine, about 33 ft. average cube, 1,169 ft., 11 pts., 5d. £24 7s 1d.
90 pieces White Pine, about 63 ft. average cube, 5,703 ft. 10 in., 5½d. £130 14s 2d.

Total White Pine, 125 pieces, 6,872 ft. 10 in. 11 pts.
Total Timbers, 156 pieces, 8,307 ft. 5 in. 5 pts.
100 pieces merchantable pipe staves, 5½ ft. long, 2½ inches thick.
100 pieces merchantable pipe staves, 5½ feet long 3 inches thick.
200 pieces equal 0 mille 2 hundred 2 quarters standard £40, £10.
5 cords merchantable hemlock lathwood, £1 10s, £7 10s.
100 pieces second quality bright pine deals, 12 feet by 11 inches by 3 inches. equal 120 Quebec standard or 1 2 20 St. Petersburg, £5, £8 6s 8d.
51 pieces spruce spars 4 to 9 inches, 3 shillings each, £7 13.
Total, sterling £252 15s 3d.
Timber per cubic foot, staves per standard mille, lathwood per cord and deals per St. Petersburg standard hundred.

A Quebec Contract of 1848

Copy of contract for a cargo of Quebec timbers, July 24, 1848; sufficient to load the "Favorite," 533 tons register, for Newcastle-on-Tyne, England, deliverable at Quebec in the fall of present year, in the customary manner, by Allan Gilmour & Co., to consist of the following assortment, or as near thereto as the ship may be able to carry, or can be made up, viz., about

30 loads of oak of fair average quality, 14 to 20 inches square, caliper measure, at 13d per foot.

30 loads of oak of fair average quality, undersized, at current rate at time of shipment.

250 loads of rock elm of fair average quality and dimensions, averaging 35 feet, at 7d per foot.

30 loads of butternut of fair average quality, if to be had, at current rate at time of shipment.

30 loads of ash of fair average quality and dimensions at 6d per foot.

And the remainder of cargo to consist of white pine timber of fair average quality, to be about—

One half the average of 50 to 55 feet cubic the log at 3¾d per foot.

One half the average of 55 to 60 feet cubic the log at 4¼d per foot.

Cargo to include 300 first quality bright pine deals at £6 6 (six pounds, six shillings) per St. Petersburg standard hundred and some thirds at £3 (three pounds), with deal ends at £4 (four pounds) per St. Petersburg standard hundred; staves of assorted lengths and thicknesses at £32 10 (thirty-two pounds, ten shillings) per mille for broken stowage. The goods are all to be of fair average quality according to the description given, and the prices are all sterling money, free of commission or other charges, payable by the purchasers' acceptance of the shippers' draft at 90 days sight, payable in London, on presentation of invoice and bill of lading.

A Quebec Contract of 1861

Copy of contract dated Liverpool March 26, 1861, being the first year that waney pine was made for the Quebec market. The firm of Benson & Co. was composed of Mr. R. H. Smith, afterwards senior of Smith, Wade & Co., with Mr. Joseph Roberts and Mr. Thomas Benson.

We hereby buy and sell respectively, Benson & Co., of Quebec, on the one part, a cargo of wood goods, deliverable at the port of Quebec, for a vessel registering about 960 tons, in the usual and customary manner, in the spring of this year; to consist of the following assortment, as near as the ship can carry:

About 20,000 feet of Scot's white pine waney board timber, 23 inches string measure at 13d per foot string measure.

Remainder of cargo out of Dennison's raft of 85 to 90 feet cubic average contents, 17¾ inches average girth of prime selected white pine at 9d per ft.

For stowage, beamfillings and houses on deck, bright pine deals one half first quality £10 10, one half second quality £6 10, per St. Petersburg standard, a fair specification of widths and lengths, including some long deals. Pipe stave culls £27 10s; merchantable £40. Puncheon staves, culls, £7 10s, merchantable £12 per standard mille for pipe and counted mille for Puncheon as may be ordered.

The above goods are to be of fair average quality and dimensions, and of the description as above stated. The prices are all sterling, and free of commission or any other charges, and to be paid by purchaser's acceptance of shipper's draft payable in London at 120 days sight on presentation of invoice and bill of lading. Should the vessel despatched for this cargo be lost, another is to be sent on advice; and the sellers on their part engage that the ship shall not return for want of lumber under this contract.

A Quebec Contract of 1865

Copy of contract dated Glasgow, March 9, 1865. Messrs. Ferguson, Davidson & Co., of Leith, buy and Messrs. Benson & Co., of Quebec, by their agents, Messrs. George Gillespie & Co., of Glasgow, sell a cargo of wood goods, deliverable at the port of Quebec by the said Messrs. Benson & Co., for a vessel of 600 to 800 tons register or upwards in the usual and customary manner, in the summer or fall of this year, to consist of the following assortment, as near as the ship can carry, viz:— about

16,000 feet of waney white pine board timber of 20 inches average string measure, 12d per foot.

4,000 feet Laurie's square white pine of over 100 feet average contents and 19 inches or upwards average square, 11d per foot.

6,000 feet Mississippi square white pine of selected 80 feet average, girthy, 9½d per foot.

2,000 feet oak, 15 inches and upwards, 18d per foot.

1,000 feet rock elm, 40 feet average cube, 11d per foot.

1,000 feet ash, 14 inches and upwards, 10d per foot.

Beamfillings white pine, 5d per foot.

Spruce deals for stowage, £3 per St. Petersburg standard.

Birch timber, 17 inches average, 12d per foot.

Birch timber, 6 pieces, extra large and curly if to be had.

Staves if required at lowest market prices.

Hemlock lathwood, 4 feet, £1 15 per cord, 4½ feet, £2 per cord.

The above goods to be of first rate merchantable quality and dimensions as customary at place of shipment. The prices are all sterling money, free on board as customary at Quebec and to be paid by purchasers' acceptance of shippers' draft at 120 days sight, payable in London, on presentation of invoice and bill of lading.

Quebec Prices in 1847

List of prices for wood goods, deliverable to vessels at Quebec, as customary, during the spring season of 1847:—

Timber of fair average quality, at per cubic foot,

	Pence
Oak, undersized	12
All 40 ft. long and upwards...	17
All 16 inches and upwards...	16½
Elm, small	6½
30 to 33 ft. average cube ..	7
33 to 35 ft. average cube ...	7½
35 to 38 ft. average cube ...	8
38 to 40 ft. average cube ...	8½
Birch, 14 inches and upwards..	10
small	7½
Ash, 14 inches and upwards ...	7½
small	6
Red pine, 30 to 33 ft. av. cube	8¾
33 to 35 ft. average cube ...	9½
35 to 38 ft. average cube ...	10
38 to 40 ft. average cube ...	10½
White pine, 50 ft. average cube.	4
50 to 55 feet average cube ..	4¼
55 to 60 ft. average cube ...	4½
60 to 65 ft. average cube ...	4¾
65 to 70 ft. average cube ...	5
75 to 80 ft. average cube ...	5½

Pine deals, 3 inches thick, at per St. Petersburg standard hundred:—

Floated pine, in proportions of one-ninth 9 inches wide, five-ninths to six ninths 11 inches wide, two ninths to three ninths other widths.

Half first quality £6 15 (six pounds, fifteen shillings).

Half second quality £4 10 (four pounds ten shillings).

Bright pine, first quality, £7 10 (seven pounds, ten shillings); second quality, £5 (five pounds).

Spruce deals, 3 inches thick, at per 100 pieces, 12 feet long, 9 inches wide; first quality £7 15 (seven pounds, fifteen shillings); second quality, £5 15 (five pounds, fifteen shillings).

Staves, all pipe, £37 10s per standard mille; W. O. W. I. Punccheon, £11. per 1200 pieces.

Lathwood, per cord, red pine, £2 5 (two pounds five shillings); hemlock, £1 10 (one pound ten shillings).

For comparison with old contract forms, we give examples of present wording of those now in use for Quebec and Montreal export business to the United Kingdom, for both "free on board" and "cost, insurance and freight" engagements. The latter mode of business from being unknown, and then exceptional, has become very general and indeed almost universal in the St. Lawrence export wood goods trade:—

C.I.F. CONTRACT by which

sell through the Agency of Wood Brokers of

. and

of buy the Goods specified

below, of the usual manufacture, measurement and classification, at Port of

Shipment. Shipment

The prices stated are sterling, including Freight and Insurance to

. or so near thereto as ship can safely get and discharge, always afloat. Freight to be deducted from Invoice on intake measure and paid by buyers in terms of usual Charter-Party and/or Bill of Lading which they agree to adopt.

Payment of amount of Invoice of each shipment to be by approved acceptance of seller's or agent's drafts, payable in London, at ninety days' sight, on presentation and in exchange for Invoice, Bill of Lading, and Policy or Certificate of Insurance for Invoice amount and three per cent., payable in London. Buyers have option of accepting at three days' sight less two per cent., but only if sellers are notified before shipment.

Sellers not to be held responsible for nonfulfilment of Contract or deviation therefrom if occasioned by any causes beyond their control, nor from any deviation caused by ship returning or losing any part of the cargo. The word about gives shipper a margin of ten per cent., more or less, under this Contract. Should the ship or ships fixed for this Contract be lost after the name being declared to the buyers, then sellers to have the option of substituting another ship or ships, or cancelling the Contract. Quantities are subject to stock shipping out.

Should any difference arise under this Contract respecting quality or otherwise, no goods to be rejected, nor payment as above refused, but the claim, which must be made within ten days of final discharge of ship, and before parcel complained of has been broken, shall be referred to an arbitrator mutually chosen, who is to finally decide whether same or any smaller sum shall be allowed and all other matters in dispute under this Contract. The expenses of such arbitration to be borne as named by arbitrator.

This agreement may be made a Rule of Court on the application of either party.

F.O.B. CONTRACT by which

sell through the Agency of Wood Brokers, of

. and

of buy the Goods specified below, of the usual manufacture and classification, all Pine Deals, etc., Ottawa Stand-

ard culling, shipment delivered at the Port of Quebec in the usual and customary manner to a vessel or vessels to be provided by the buyer, with reasonable loading days, to load in a safe berth as ordered by sellers and if possible disburse with them.

The prices stated are sterling.

Payment of amount of Invoice of each shipment to be by approved acceptance of seller's or agent's drafts, payable in London, at one hundred and twenty days' sight, on presentation and in exchange for Invoice and Bill of Lading. Any goods for Spring delivery remaining unshipped on 15th July, or for later delivery on 15th November, to be paid for by buyer as above on receipt of Invoice for computed value, including all charges and to be held for account and risk of buyers.

Sellers not to be held responsible for nonfulfilment of Contract or deviation therefrom if occasioned by any cause beyond their control, nor from any deviation caused by ship returning or losing any part of the cargo. The word about gives shipper a margin of ten per cent., more or less.

Should any difference arise under this Contract respecting quality or otherwise, no goods to be rejected, nor payment as above refused, but the claim, which must be made within ten days of final discharge of ship, and before parcel complained of has been broken, shall be referred to an arbitrator mutually chosen, who is to finally decide whether same or any smaller sum shall be allowed and all other matters in dispute under this Contract. The expenses of such arbitration to be borne equally by buyers and sellers.

This agreement may be made a Rule of Court on the application of either party.

Mr. Fred T. Verrall, of McBean and Verrall, wholesale lumber dealers, Toronto, Ont., was married on September 10th at the Old St Andrew's Church, Toronto, by The Rev. Professor Lam, to Anna Jean Palmer of Toronto. Mr. and Mrs. Verrall left for New York and sailed on September 13th on the Olympic, for Europe.

The Late Alexander Gibson

Readers of the Canada Lumberman recently learned with much regret of the death of Mr. Alexander Gibson, one of the most widely known lumbermen of the Maritime provinces, which occurred at his home, Marysville, N.B. Mr. Gibson was 94 years of age and for forty years had cut and manufactured, on an average, 30,000,000 feet of lumber annually, the bulk of which was shipped to English and European markets.

In 1897, owing to the great increase in his business, which made it impossible for one man to attend properly to all its complicated details, Mr. Gibson's vast enterprises were taken over by a stock company, known as the Alexander Gibson Railway and Manufacturing Company, Limited. Mr. Gibson was appointed president and general manager of the company, and filled the position up to the time of his death, giving it his close, personal attention. He was a great philanthropist. Concerning Marysville and Mr. Gibson, it has been written, "Here is a town of 2,500 inhabitants, owned and controlled by one man more absolutely than the Czar of Russia controls his vast domains; but the reign of this industrial Alexander is a beneficent one; his subjects are contented and law-abiding, and Marysville is in all respects a model community. It is a beautiful town as well, and, standing as it does a monument to the energy and ability of New Brunswick's foremost citizen, the visitor cannot fail to be repaid for time spent in viewing its throbbing factories and peaceful, homelike tenements."

Death of a New Brunswick Lumberman

C. Miles Moore, a well-known lumberman of Woodstock, N.B., died recently at the age of 53 from an affection of the throat. Mr. Moore, who had returned a few days previously from Vancouver, B.C., was born in New Brunswick and settled in Woodstock when a young lad, assisting his father, the late Fred Moore, who was a large owner of mills and lumber. After the death of his father he and his brother, George, conducted lumber interests in Griswold, Maine, the latter still being in charge of the mills.

Handling Slow Payers

In a letter sent to all of his resident and travelling salesmen, governing their official conduct a successful sales manager incorporates the following trite remarks:

When I sold a new stock it would always be for cash, and then it would be my pride to see if I could get a cash payment to send in with the order by telling the man what a good impression it would make on the firm to send a thousand or fifteen hundred dollars in with the order, and as he had the money lying right in the bank, why not let me have it now, etc., etc.

If I found a chronic slow payer among my trade I would try to cure him, and if I failed I would ask the president to try his hand on it, and if this did not work, I would quit him because he, the merchant, is sure to fail unless he becomes a prompt payer.

I would not be a cutter of prices, because I am convinced from past history that no cutter of prices is ever successful in any great measure, nor would my firm ever want to call me to any very important position if I were a price cutter, especially on little things, and also because there is no record of a price cutter ever becoming well to do.

I would study close economy in my expense accounts and be quite as careful of the firm's money as I would my own, doing my utmost to decrease the expense of doing business, so far as my part of it is concerned.

I would never try to ask a man what he wanted, but always rather tell him.

I would tell each customer the name of my sales manager and how he is watching us and how pleased he would be to be of any service to the customer, and how delighted he would be to attend to any mail order, and to be sure to ask for him personally whenever he, the customer, is in town.

I would try to remember that there are a world of travelling men and but very few salesmen; hence, I would try to be a real salesman as shown by my results. I would never speak ill of a competitor. I would never write a mean letter to my firm nor to my sales manager.

I would never be familiar with a salesman for a competing firm, and never ask him "How is business," for he would be sure to try to mislead me.

I would invariably keep my promises and if called off my time card would promptly notify my customers by mail.

I would try to be a good listener—many a lumberman likes to talk—don't deny them this pleasure, and a good salesman is, at times, a good listener.

I would always be neat and clean in my attire. I would avoid burdening my firm with petty details lest they call me an "old maid."

I would remember that while I did not know it all about the business and my goods, neither did my customer, and what I did know I would use to the very best advantage.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

An Interesting Clyde Product

The Clyde Iron Works, Duluth, Minn., the well-known manufacturers of steam log loaders, skidders, logging tools, hoisting engines, etc., have recently completed for the city of New Westminster, B.C., a 150 h.p. electric hoist for operating a clam shell bucket on a derrick. The hoist has three drums arranged according to the "water-fall" type and is also equipped with a Clyde "Type A" bull-wheel swinger. All the drums have 18-inch barrel, the middle drum and the third being lagged to 24 inch. The 150 h.p. motor is a three-phase, sixty cycle, two hundred and twenty volts induction motor with outboard bearing bolted to bed extension. It develops 720-700 r.p.m. This interesting outfit was made by the Clyde Iron Works for Messrs. Taylor & Young of 513 Pacific Building, Vancouver, B.C., from whom it was ordered by the city of New Westminster.

Hanchett Outfit for Graves Bigwood Plant

The Hanchett Swage Works, of Big Rapids, Mich., have furnished a complete outfit of Hanchett saw fitting equipment to the Graves Bigwood Company, Byng Inlet, Ont., for their double band, gang and double re-saw mill; also to William Copping Company, Joliet, Que.; also the Finch, Pruyne Lumber Company, Laurier, Que., and a complete band mill outfit to A. Joly de Lotbiniere, Quebec, P.Q.

'Merit' Products

The accompanying illustrations represent equipment of the Merritt Manufacturing Company, of Lockport, N.Y., manufacturers of veneer cutting and dimensioning machinery, crate head machinery, etc. Fig. 1 shows a "Merit" veneer lathe constructed on a single massive bed casting of such design that the whole machine presents a picture of strength, rigidity and style distinctly its own. The lathe is offered in the following swings, referring to the diameter of the largest log that can be cut in it—32, 42 and 52-inch. This represents three different patterns for each of which there are ten different lengths of knife varying from 28 to 100 inches.

Fig. 2 represents an automatic knife grinder manufactured by the same company. This machine makes use of a cup wheel, which gives either a straight or concaved bevel according to the angle at which the slide is set. The feed rack is steel with teeth cut from the solid and the driving pinion is hardened steel with cut teeth. The feed is noiseless, durable, smooth running and free from jar.

Fig. 3 is a diagram representing the idea underlying the construction of the "Merit" balanced plate veneer dryer. This machine involves a new arrangement of steam heated plates whereby the redrying and flattening of wood veneer has been reduced to a science. A truck with rockers balances two parallel frames which hold the horizontal plates in two series, even and odd. The operating lever carries a group of reverse gears engaging a rack attached to the power jack which provides a breathing movement with intermittent pressure on the veneer.

Fig. 1

Fig. 2

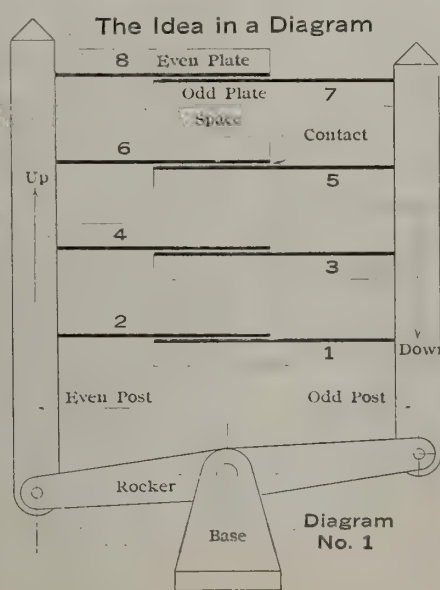

Fig. 3

Fig. 4 shows a fifteen space dryer with spaces 100 inches wide by 52 inches deep, capable of holding 540 surface feet of veneer at one filling. Catalogues A and B recently issued by this company illustrate and describe their equipment fully.

A Special Soda for Dipping Lumber

Specially prepared bicarbonate of soda is now being sold for the dipping of lumber to prevent sap stain. This is known as Zenith carbonating powder, and is manufactured by Church and Dwight, Limited, Montreal. Four and a half pounds to ten gallons of water is the best proportion for use, although a weaker solution may be found sufficient. The trough or vat should be of sufficient size, length, width and depth to submerge the lumber thoroughly when priming or grading, immediately after the lumber has left the saw. The lumber can then be stacked in the usual way.

A Washington despatch states that Sweden has raised the question whether Swedish wood pulp and paper shipped to another country and then transhipped to the United States is entitled to free entry. The Customs Court decided that these products from Sweden were entitled to free entry under "most favored nation" treatment because that privilege is granted to Canada. The Treasury Department has referred the question of indirect shipments to the Department of Justice. The decision on the subject will affect all other countries having "favored nation" treaties with the United States.

Northern Hemlock and Hardwood Production

The Northern Hemlock and Hardwood Manufacturers Association, in a recent report state that hemlock production in July was approximately the same as in June, while the hardwood cut showed a reduction of 26 per cent. Altogether, the association mills sawed 13 per cent. less lumber in July than in June. Hemlock shipments were slightly larger in July than in June, while hardwood shipments increased 8 per cent., making a total gain in shipments of 6 per cent. Nearly as much lumber was shipped as was sawed, a good showing for the height of the sawing season. The summary of reports for twelve months shows that during this period, hemlock shipments exceeded the cut by 19 per cent. and hardwood shipments exceeded production by 2 per cent. Shipments of hemlock and hardwoods combined exceeded the production by 11 per cent. since August 1, 1912.

The Dominion Board of Railway Commissioners will hold a session on September 16th to consider the discontinuance of the cartage system by Canadian railways, which was recently announced to go into effect on October 1st. A number of Boards of Trade, Lumbermen's and Manufacturers' Associations requested the Board to have the railway companies show cause for this step. In case the railway companies are permitted to carry out their intention it is probable that shippers and consignees in general will provide a substitute system.

Fig. 4

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

WANTED TO BUY: One million feet 1-inch Pine Culls and 500,000 feet 1-inch Hardwood Culls. Will take delivery by water or rails. M. Brennen & Sons, Hamilton, Ont. 16-21

Wanted Building Lumber

To sell by active man, middle age, practical experience selling building lumber and hardwoods. Thorough knowledge of credits and collections. Efficient and competent to handle large transactions. Now employed selling in New Jersey and Eastern New York. Want a position offering opportunities for advancement. Address Box 836, Canada Lumberman, Toronto, Ont. 15-16-17-18-19-20

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4 1/2 in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

SALE OF

Red and White Pine Timber

Notice is hereby given that tenders will be received by the undersigned up to and including Thursday, the 30th day of October, 1913, for the right to obtain licenses to cut the Red and White Pine timber on timber berths in the Townships of Thistle and McWilliams, in the District of Nipissing.

For maps and conditions of sale apply to the undersigned or to the Crown Timber Agents at Sudbury and North Bay.

W. H. HEARST,

Minister of Lands, Forests & Mines.

Toronto, August 23rd, 1913.

N.B.—No unauthorized publication of this notice will be paid for. 17-20

Trustees Auction Sale of Valuable Timber Limits, known as the McArthur Limits

AUCTION SALE of valuable timber limits in the Province of Quebec, held under License from the Quebec Government.

There will be offered for sale by Public Auction at the Russell House in the City of Ottawa, at twelve o'clock noon, on Wednesday, the 1st day of October, A.D. 1913, the following timber limits:—

Gattineau Limits

Comprising timber berths numbers 252 to 260 inclusive, located in the district of Montcalm on the Gattineau and Ottawa Rivers, having a total area of four hundred square miles and being located about eighty miles above Maniwaki, the terminus of the Maniwaki Branch of the C. P. R.

These berths are well timbered and well watered, as will appear upon examination of the cruisers' reports below mentioned, and are believed to be among the most valuable timber properties now available.

Lake St. John Limit

Timber berths Numbers 7 and 8, Range 3, north of Lake St. John, situate on the River Alex flowing into the north arm of Lake St. John and containing about forty-five square miles.

Each limit will be offered for sale subject to a reserve bid.

Terms.—Ten per cent. of the purchase money on date of sale and the balance within fifteen days thereafter (without interest), unless otherwise arranged with the vendors.

For particulars and conditions of sale and cruisers' reports and maps of the limits, application may be made to the undersigned solicitors.

Peter Ryan, Toronto,
Auctioneer.

Robertson & MacLennan,
54 Canada Life Building,
Toronto, Ont.

Solicitors for Vendors.

18

For Sale—Small mixed timber limit and Steam Saw Mill, in Eastern Ontario. For full particulars write Box 871 Canada Lumberman, Toronto. 18-t.f.

Wanted—Hardwood Limit consisting of Birch, Beech and Maple, anywhere from 10 to 50 thousand acres. State location, price and terms. Box 874, Canada Lumberman, Toronto. 18

Miscellaneous

Wanted—Uninjured, live Silver Foxes, Mink and Marten. Reid Bros., Lumbermen & Furriers, Bothwell, Ont. 18-19

New Steel Rails for Sale, 25 and 30 lbs. per yard, with fish plates. A bargain for a quick disposal. Imperial Waste & Metal Co., 713 Queen Street, Montreal, P.Q.

Sawing Notes For Filers

Practically everyone knows the small differences in spacing, depth of gullet, hook on front, and pitch on back of tooth, making the teeth variously slim or blunt. All have to do with successful operation. It takes very little to throw a saw out of balance, and while the use of heavy gauge saws imperfectly fitted is sometimes practical, high speed thin gauge saws must be in perfect round and balance or their use is impracticable, says the Timber Trades Journal. It is a serious fault in some plants that anyone and everyone is permitted to take a try at the saw-fitting, each man killing time, with the sawing machine standing idle, and with supplemental waste in files, saws and poorly sawed stock. It does not pay to have high-priced mechanics, who have to do with fit and finish of sawed stock, put on extra time because of poor sawing or dressing. Good work at every step is a prime essential.

The use of a cheap hand or bench gummer keeps down investment, but increases the fixed charges, and is hardly justifiable except in the smallest businesses.

Faults in setting consist variously of too much set, too deep set, too little set, and uneven set. There should be enough set on a radial line drawn from the centre of saw towards point to afford easy clearance.

Do not file cross-cut teeth so as to produce different bevels on different teeth. This is almost certain to produce long and short teeth and uneven spacing. The back of tooth has considerable to do with guiding the saw, and if one tooth has a nearly square back, and the next has a back nearly filed off, the effect on teeth and cutting efficiency will be readily manifest.

A suitably shaped grinding wheel on an automatic sharpener affords the very best means for uniform bevelling and for shaping the base of gullet to avoid cracks. Use slim teeth with plenty of hook for soft, fibrous woods; strong teeth with medium hook

for hard woods, but always employ enough hook to avoid scraping.

To Clean a Leather Belt

A writer in an exchange submits the following as the best and proper manner of cleaning a leather belt. It may seem simple, but it is safe and effective, as has been proved by many who have thus restored old and dirty belting which had become almost or quite unfit for use.

Coil the belt loosely and place it on edge in a tank in which it may be covered with naphtha. A half-barrel makes a good receptacle, but something with a tight cover would save the loss by evaporation. Put in enough naphtha to cover the belt completely, and allow it to remain for ten or twelve hours, then turn the belt over, standing it upon the other edge. The vertical position of the belt surfaces allows the dirt to settle to the bottom of the receptacle as it is washed out, and permits the naphtha to get at all the parts.

After the belt has remained in the naphtha another ten or twelve hours, or until perfectly clean, raise it and allow the naphtha to drip back into the tank. Then lay the belt flat, stretching or shaking it until almost dry.

You will find that the naphtha will not affect the leather nor the cement in the center of the belt, but may open the joints at the edges, in which case the old cement should be scraped off and the edges recemented. The belt man will know how to do this. The belt will now be somewhat hard, and should be treated with a reliable belt dressing before being replaced on the pulleys.

Chestnut for Doors

Years ago good chestnut was more plentiful than it is now, and consequently not so high in price. It was easy to get higher-grade material for door-making, and as a result the chestnut was among the first of the hardwood doors to become popular. The solid chestnut door is still holding a favorite place in quite a section, but it is no longer so easy as it once was to get high-grade material at low cost for making it. The result is that in the making of solid chestnut doors now it is quite a practice in America to buy sound wormy wood, using the best cutting from it to make solid doors, and the balance—that which has too many wormholes for face work—for cores in the making of veneered doors. Chestnut is one of the admittedly best core woods going, and the worm-holes in it help rather than hinder its usefulness in this work. Therefore sound wormy chestnut is a very desirable product for making up the core bodies of veneered doors. The veneered door is a familiar article everywhere, and is used to

quite an extent in every community; consequently the combination works out well for the door business, and makes chestnut quite an important item to the makers of doors.

An Excusable Waste

At the last meeting of the yellow pine manufacturers, A. T. North, an engineer, made a report on timber waste and lawful fiber stresses, in which he shows by figures that some of the larger cities require the use of unnecessarily heavy joists and other structural timber. He regards this as a form of waste which makes construction with lumber cost more than it should, and thus retards its progress. The engineer may have statistics to show that building restrictions in some cities require the use of too heavy framing. However, any man who has followed after and inspected the work done by the average city speculator or contractor who is building houses to sell, is likely to be impressed with an entirely different idea from too much timber being used. There is a disposition to skimp construction, which makes necessary some rigid building rules, and, anyway, it is better to use an extra quantity of lumber and be safe, than to have flimsy buildings. This is really not a form of waste, but a factor of saving.—The Wood-Worker.

Review of Current Trade Conditions

Ontario

The lumber trade of Ontario suffered as usual this year during the two weeks of the Canadian National Exhibition at Toronto. Every year the lumber travellers in Ontario find that there is little to be gained by calling upon the country trade during the progress of the exhibition. Business therefore becomes very quiet. This year, the exhibition came after the lumber trade had had an unusually quiet summer. In some localities trade had been good, as summer trade goes, but not one was at all enthusiastic about the volume of business which he has been carrying on. The exhibition lull therefore, found trade even duller than usual. Within the next two or three weeks it is expected that conditions will improve. Already a fair number of enquiries are reported.

The province of Ontario has harvested crops this year which, in nearly every respect, are better than in any previous year. The probability therefore is, that as soon as the farmers have obtained money for their crops and have had a little time to look about, they will be coming into the market with larger demands for lumber than usual. Retail yards are not reported to be in a good position to meet a strong demand. Most of the retailers have been going along carefully, buying only what they can find a ready sale for. Stocks in retail yards therefore, are low and rather broken. Under these conditions it is probable that an active fall demand will see the wholesalers enjoying a good trade.

There is considerable doubt as to how stocks available in wholesalers hands or still unsold at the mills, will stand an active fall trade. The cut last winter was not great and stocks have been moving pretty well throughout a large portion of the year to date. Wholesalers who have managed to keep a fair supply of stocks, especially of the more saleable grades and varieties, are likely to find themselves in an excellent position a little later on.

Shingles are easier than they were earlier in the summer. British Columbia manufacturers have recently been accepting lower prices. It is very difficult at present to quote an accurate price, as trade conditions are badly mixed up. Some wholesalers report having bought shingles a short time ago at a higher figure than they can now realize at retail.

In the hardwoods, thick maple is rather quiet. Implement manufacturers did not manufacture to the same extent as usual this year, on account of the dullness in western trade. Prices have not fallen off to any appreciable extent, but stocks are not moving at all actively. Basswood is quiet in Ontario while in Quebec it is rather strong on account of short supplies.

No important change is reported from the Tonawandas, but the arrival of large blocks of white pine and hemlock by vessels from upper lake ports is taken as showing confidence on the part of some of the larger companies that trade will improve in the near future. The Tonawandas' trade is mostly with manufacturers whose business is effected by the tariff and will not become very active until the tariff situation has been settled.

Eastern Canada

Reports from Montreal indicate that the lumber trade is gradually improving, although it is not nearly as active as it was a year ago. Prices remain steady. The demand for white pine lath is good and stocks are scarce. Hardwoods are quiet, but steady.

The lumber and timber trade at Quebec is fairly active, a steady business in wood goods being in progress. A tendency toward higher prices is reported. The demand for lumber at present is good enough to make the supply look rather on the light side. Scarcity of schooners and barges for shipment of lumber on the north shore of the lower St. Lawrence is making it difficult for stocks in that district to be marketed. Shipments of square timber are more numerous to the United Kingdom. Pine and spruce deals are also in better demand for export.

An interesting discussion of the lumber market in the Eastern States is published elsewhere in the letter issued by Messrs. Chase, Talbot & Company, New York, who make timely reference to the possibility of selling Pacific coast timber and lumber on the Atlantic coast. The chief point of interest is the fact that these products are already being sold on the Atlantic coast in spite of a freight rate amounting to \$4 to \$5 per M. feet more than the rate which will be available after the opening of the Panama canal. They are landed now at \$28 to \$30 per M. feet for large choice sizes and net the shipper a fair profit. About 2,000,000 feet of Douglas fir is now in storage at New York under these conditions. These facts are of much import-

ance to manufacturers of spruce in eastern Canada and manufacturers of yellow pine timber. In the same letter reference is made to the fact that receipts of lumber at New York continue light, but that they are quite sufficient for the demand. The buyer is reported as practically in control of market conditions. Building operations have been greatly curtailed in New York. Improvement is expected in the general lumber market conditions in about two months at the latest.

Some improvement is noted at New York in the demand for eastern spruce. Car orders are fairly frequent and straight cargo business is more active. At Boston, prices for eastern spruce continue firm, although trade is quiet. Signs of higher prices are rather frequent. Random is more in demand at firmer prices. Planed covering boards are not plentiful and a price of \$23.50 is reported firm in some quarters. Matched and cleared board, 5-inch, are rather quiet. The demand for hardwoods at New York is better, especially for the higher grades. Birch and maple are well held and plain quartered oak continues strong. At Boston, the hardwood market is steady with good signs of improvement. Hemlock at New York shows some improvement and stocks are beginning to be heavily shipped from mill points. Boards are strong and enquiries for early fall shipments are numerous. The shingle market at Boston is dull and weak, although one wholesaler reports good business on a well-known brand at \$3.75 for extras and \$3.50 for clears. Other brands are holding at 15 to 20c. higher, but are not finding much sale. Lath continues to improve both in demand and price selling at about \$4.40 for 1½-inch and \$4 for 1½-inch.

United States

It would not be safe for any one to predict an approaching return of good times in the United States, but there are some decidedly encouraging conditions to be noted on the surface at present. Improvement is noted in the iron and steel market, with buying on a more liberal plane than for some time, and prices are higher. The money market is showing a decidedly easier tone, although it is not likely that really cheap money will be available in the United States this fall. These conditions, together with the extensive good crops should bring about a revival of trade activity by the end of the present month or early in October, if we are to believe the conclusions of those who are watching the situation closely. A most encouraging feature is the fact that mercantile houses in the United States are now able to sell their paper with less difficulty than at any time during the last four months.

The lumber market is showing a slight indication of the improvement in general, but backwardness is still noticeable on the part of those who should be placing orders for future stocks. Mixed car loads are moving steadily, to replenish broken stocks. Stocks in retailers' and large consumers' hands are not large, as a result of the quiet summer trade, the irregular prices, and the facility with which lumber could be secured on short notice during the summer which has just passed.

Building activity has kept up fairly well during the past six weeks and reports from the larger cities now indicate that fall business is commencing on a satisfactory scale.

The demand for northern pine is gradually obtaining its customary autumn proportions. All grades are being held at steady prices and the quantity going into consumption is steadily increasing. Hemlock stocks are moving slowly, as a result of farmers being busy with their harvesting operations. The demand from the country districts is small. Concessions of from 50c. to \$1.50 from the February 25th list are reported, which seems to be larger than necessary when one remembers that there is only about a 50 per cent. stock of hemlock. Hemlock in the east is more active. Buffalo trade conditions are steady.

Hardwood manufacturers and dealers report a satisfactory demand in general and are pleased with the outlook for fall trade. In the north, an exceptionally heavy enquiry has developed for 1-inch No. 2 and No. 3 basswood. One-inch and one and a half-inch hard maple is moving steadily, while two-inch is not so active. Improvement is reported in birch. Ash of all sizes is in strong demand. Elm is moving freely, No. 3 being in very strong demand. Soft elm has not advanced in price, although rock elm has. Box factories and railroads continue to absorb large quantities of low grade material.

Great Britain

Important progress has been made in Great Britain in chartering arrangements, which are expected to bring on a revival of the free-on-board market. Shippers were expecting to do a very fair trade at

the old prices, during September, so long as charters were available at the old rates. Tonnage has been more plentiful of late and a tendency toward slightly easier figures is reported. Price variations are only slight. Shippers are reported to be well sold and no one ventures to deny that the market is quite firm. Consumption of lumber in Great Britain continues on a large scale, although one frequently hears prophesies of an end of the "boom." There is little actual indication of any re-action however.

Arrivals of lumber at London have shown some decline during the last few weeks. The tone of the market however, continues good and merchants are readily sorting up their stocks and replacing them whenever they can obtain a reasonable rate. The chief reason for this is that the close of the shipping season is approaching when freights may be expected to advance. Deliveries at London docks for the week ending August 23rd amounted to 5,626 standards, as compared with 7,732 standards during the corresponding period of 1912.

The end of the holiday season is counted upon at Liverpool to find all the great industries in full work. This is expected to make trade more active generally. Taking the market all round, there is a firm attitude, due in large measure to the stiff position of the freight market. Spruce deals at Liverpool are showing practically no change. Arrivals from Miramichi, Campbellton and other gulf ports are only in fulfillment of contracts made "to arrive" some time ago and therefore show no price changes. Many of the large consumers of spruce deals in the inland districts are reported to be still holding off buying and laying in their stocks only "from hand to mouth," expecting that

the market will be easier later on. The possibility of any decline is now practically out of the question and these consumers may be expected to come into the market from now on. The boom in trade conditions generally in Great Britain is reflected in an interesting manner by the tonnage reports on the Mersey. Tonnage engaged in carrying timber at Mersey ports including Manchester during 1912 is estimated as having amounted to 821,000 tons, an increase of 84,000 tons over 1911 and 52,000 tons over 1910.

Reports from Manchester state that prices are firm all round and show signs of advance. Spruce deals are said to have reached bottom prices. Many are confidently expecting that they will advance from 5s. to 7s. 6d. before Christmas.

The Glasgow market for lumber continues unchanged, the volume of business being moderate, although enquiries have been quite encouraging of late. Imports from Quebec during the present year have been very light. Pine goods arriving have been largely contract deliveries. Even the low grades, which usually are plentiful, have been scarce. It is believed that the average merchant is carrying very light stocks and that he and his fellows will be scrambling over one another before long, just as they did a year ago, to cover their requirements at the last moment. Last year this situation led to a very rapid improvement in prices. Merchants who are buying on a hand-to-mouth policy will probably find themselves out of stock before the end of the winter, as there will be very little stock consigned to Glasgow before the end of the season.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Ottawa Trade Expecting Improvement

Ottawa, September 9; (Special to the Canada Lumberman).—Trade still continues to be rather dull here, but the prospects for brighter things in the near future are encouraging. Local lumbermen are expecting to benefit by the Central Canada Exhibition, now being held in Ottawa, as it is likely to bring many people to the city who are prospects for customers. The building permits issued during August of this year in Ottawa show a considerable decrease compared with the same month last year. In August, 1912, there were 40 permits issued with a value of \$265,575. Last month the total was 40, with a value of \$173,300. The estimated value of the buildings for which permits have been issued this year is half a million dollars ahead of the valuation for the same period last year; that is, for the first eight months. The total value of the permits this year is \$3,249,580 against \$2,738,925 for the eight months of last year.

Within the past two weeks two fires have occurred at the plant of J. R. Booth, causing a total loss of \$112,000. The larger of the two fires occurred yesterday afternoon, when the timber mill caught fire and by the time it was put out the mill and its valuable machinery were a mass of charred ruins. The building was erected and the machinery installed only three years ago. For a time it looked as if the fire would spread beyond the mill and wipe out the entire plant. The prompt work of the Ottawa fire brigade and the volunteer fire brigade at the plant prevented this.

What caused the fire is a mystery. Curiously enough it was the fifth lumber fire within three weeks. The smaller of the two fires at J. R. Booth's occurred at the sawdust conveyors last Monday and did \$10,000 damage and caused the whole of the lumber mills to close down for a week. Three hundred men were thrown out of work temporarily by yesterday's fire. In both cases the loss is fully covered by insurance. All the five fires mentioned above started from unknown causes and there is a fear entertained by some local lumbermen that an incendiary who has a grudge against them is at work. The loss to the lumbermen affected by the five fires in the last three weeks totals about \$150,000.

Chairman Drayton of the Railway Commission, is expected home from England at the end of the week and lumbermen in general are waiting with interest to learn the contents of the report he will submit to the government respecting the ocean freight rates and their regulation. It is learned that the attitude of the British Government is wholly sympathetic to the proposal for establishing some kind of an international tribunal before which the Atlantic steamship companies will be expected to justify their rates. The matter of regulating the rates is such a large one that in order to give proper effect to any thorough system of regulation the co-operation of the United States government may be necessary. It may be necessary to pass certain legislation even before the Dominion government can take any action. Mr. Drayton's mission, however, will have a moral effect to the advantage of shippers.

The town of Pembroke has taken a new lease of life and promises to become a city before very long. Nearly one hundred houses have been built within the past twelve months and about 100 are now in course of erection. A party of capitalists is conducting negotiations with the town council which, if successful, will result in the location of a new woodenware factory in the town. This will make the third new factory to locate in Pembroke during the last 12 months. The two others being the Pembroke Shook Mills and the Steel Equipment Company. The shook mills now employ 150 hands and are selling their boxes all over the country.

A Better Demand at Quebec

Quebec, Sept. 8th; (Special to the Canada Lumberman).—A steady business in wood goods is being carried on here and prices are well maintained, with a tendency to increase. There is a good demand for lumber, and the supply is not up to the demand. On the north shore of the lower St. Lawrence a large quantity of lumber is awaiting shipment, but there is great difficulty in procuring schooners and barges to carry it. This difficulty is more likely to increase than diminish as the season advances, as carriers do not care to send their vessels down there in the fall.

There are considerable quantities of square timber being shipped from here to the United Kingdom. This consists principally of waney white pine, and apparently first quality wood.

Large shipments of deals, both pine and spruce, are going forward. Those from Quebec are going to Europe in steamers, while those for Buenos Ayres, Rio de Janeiro, etc., are taken in sailing vessels from ports on the north and south shores of the lower St. Lawrence.

The shipment of pulpwood continues on a large scale, the number of steam barges from Ontario and the United States, engaged in the business, comprising an extensive fleet. From this port. The shipment of wood from the Lake St. John district is heavy and steadily increasing. A considerable amount of this is shipped by canal boats to the United States.

Some of the mills in the Saguenay district are converting the wood into pulp. This is principally shipped from Chicoutimi, although considerable is sent here by rail shipment to Europe.

Improvement Noted at Montreal

Montreal, September 10th; (Special to the Canada Lumberman).—Although trade is by no means as brisk as at this time last year, there is more passing than was the case recently. It is gradually picking up, and there are indications that, with the good harvest in the west, there will be a satisfactory fall trade, especially in common grades. So far as the local demand is concerned, there is a fair request from dealers in the north and west ends of the city, but in

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

WE CARRY THE LARGEST AND BEST ASSORTMENT
OF DRY SPRUCE IN CANADA

the east there is very little business to speak of. Retail stocks are low, many dealers having had to reduce in consequence of the monetary situation. Prices however, keep firm. White pine lath is very scarce. It is being shipped up to the saw, and quotations are stiff, Hardwoods generally show little activity, but prices keep up.

Judging by the permits, some heavy building is being carried on. For last month, the total was \$2,318,672, an increase of \$953,842 as compared with the corresponding month last year; while for the eight months of the year the total was \$13,816,622, a gain of \$2,635,246 on 1912.

There is an abundance of freight boats on offer for shipments to New York, but a considerable amount of lumber is being held back pending the settlement of the United States tariff question.

Water conditions in the Province of Quebec are very low, and some mills have been closed down owing to the logs being hung up.

J. J. McFadden and Company, East Templeton, P.Q., are through with their sawing for the season.

Stocks of ground wood are being rapidly shipped out, two large mills with heavy accumulation having sold at poor prices in order to get rid of the stocks. The continued low water in New York State has had the effect of making a very heavy call on Canadian ground wood, although there is no immediate prospect of any material change in values. Stocks at the mills on the Welland Canal have been cleaned up.

There is a dull feeling in the sulphite market. Conditions in the United States have been against a full consumption of paper, the tariff being an important factor. As soon as this question is settled, it is probable that there will be a very big increase in the demand.

Newsprint is rather weak, the heavy shipments of Canadian paper to the United States having reduced quotations. It is understood that some of the large companies will not sell newsprint under \$43 per ton delivered.

St. John Trade Quiet—Strike Still in Force

St. John, N.B., September 8th; (Special to the Canada Lumberman).—There is nothing of importance to report from this section of the country. The lumber business is practically dead, and it looks very much, from present indications, as though the sawmills at St. John will remain idle during the rest of the year, unless the operatives return to work at the same rates as they were receiving when the mills closed.

Very little lumber of any kind is being shipped from this port. A few small cargoes are being shipped through here from interior mills, but are made up of mixed schedules going to Sound ports and to Boston. Very little if any is going to New York. The market there refuses as yet to buy unless at rates which mean a loss to the manufacturer. No lumber for the American market remains on the wharves here, it having been all shipped during August; some ten millions of long lumber and about five millions of lath being shipped.

The interior mills are benefitting very much by the strike, as the factories here are forced to go outside for their supplies.

Merchantable spruce boards are being sold in scow and cargo lots at \$15 per M., where \$13 predominated in the spring; refuse boards at \$11; refuse scantling and deals \$10, where the price received by country mills in the spring was not over \$8. All the above prices are delivered at St. John. No stocks to amount to anything remain on yards at mills here. In fact the yards are really bare of stocks. Building is being much hampered on this account as it is impossible to get many sizes at the interior mills, as they do not have the run of logs in lengths, etc., cut by city mills. In some cases the work has had to be put off until next year on this account.

The English deal market remains firm. In fact, one manufacturer in St. John who did not sell deals in the spring, is said to have received \$17 per M. for his deals on his wharf. Of course, there are no stocks of English deals for sale here. Freights to England markets are very firm and there is seemingly not enough tonnage to go around. As yet the winter rates for liner shipments have not been set.

The New England market seems to have improved of late, and the base price now remains firm at \$24.50, with an outlook for \$25 in the near future. The New York market has not improved, although it cannot be said that it is any worse. It seems very hard to sell random at any price, while schedules or orders are being placed at from \$24 to \$27, according to sizes required. Laths have eased off to about \$2.75.

Messrs. Stetson Cutler Company have cleaned up practically all lumber at the different mills here, having had about ten to twelve millions of long lumber and five to six millions of lath when the mills ceased on account of the strike on June 14th. All this has since been shipped.

The Outlook on the St. John

Mr. Flavien Chouinard, of St. Pamphile, Que., one of the leading lumber operators on the Upper St. John River, speaking of next season's operations on the headwaters of the St. John River recently said

that nothing could be settled until definite action is taken regarding the millmen's strike at St. John. Premier Flemming had about succeeded in arranging a settlement of the strike at St. John," he said "If the strike is settled and the mills start running without much more delay, there should be a fair-sized output of lumber on the St. John River this year. If the mills at St. John remain closed, the mill owners won't want to cut any more logs than they have now."

Tonawanda Trade Still Quiet

The Tonawandas, September 7th.—Business is still pretty much the same as two weeks ago. However, with vacations about over and the tariff bill about to be signed, the lumber market is expected to show a change for the better before another fortnight. "The conditions have been so unsteady all summer," said a well-known wholesaler yesterday, "that the situation, so far as lumber is concerned, has been at times actually discouraging. The Tonawandas supply manufacturers whose outlook is decidedly dependent on the tariff and they have been buying only what they needed to carry them along through the summer. The trade here will not become settled until Congress finishes its work which from latest reports from Washington will be soon." This opinion would answer for nine out of ten local dealers. White pine shows what activity there is in the cheaper grades. The greatest difficulty is in meeting the demand for box lumber. Prices on the latter hold up strong and there is no sign of a reduction however slight. The better grades of white pine have shown occasional life that promised well but collapsed before anything important developed. One favorable feature at the Tonawandas is the arrival of large blocks of white pine and hemlock by boat from upper lake ports. The larger concerns are the heaviest receivers, which is taken as a strong indication of confidence in a not far distant revival in trade all along the line.

Lumber shipments over the Erie canal from the Tonawandas for August show an increase of more than a million feet over the corresponding month last year. July also showed a big increase, the month's shipments being 2,000,000 feet more than in July, 1912. From now until navigation on the canal closes, shipments are expected to show a uniform increase more than sufficient to wipe out the 3,000,000 feet which 1913 shows below the total shipments for a corresponding period of last year up to September 1st. Since the opening of navigation this year 47,000,000 feet of lumber has been shipped from the Tonawandas over the Erie canal.

Mr. W. G. Palmer, for years the Tonawandas' largest manufacturer of sash, doors and blinds and general wood working, will move to Rochester, N.Y. Five years ago Mr. Palmer established a branch yard and mill at Rochester and later another at Syracuse, N.Y. Both enterprises have grown so rapidly that the owner finds it more advantageous to reside at Rochester so that he can be nearer his Syracuse business.

The fall car shortage is making itself felt to some extent locally but not so seriously as last year, at this time.

Pacific Coast Products in the Eastern States

Chase, Talbot & Company, New York, in their market letter under date of August 30th, say:—About two years ago, and frequently since, we have commented upon the possibilities of Pacific coast lumber products finding a market upon the Atlantic seaboard, after the opening of the Panama Canal. Within about a year, deliveries through the canal will be an accomplished fact. Already, modest quantities of lumber and timber have come forward, notwithstanding the non-receptive condition of our market, and today there is in storage here about two million feet of Douglas fir timber, awaiting sale. This stock has rounded the Horn, or crossed the Isthmus by rail, by either method of shipment, at a freight rate of from \$4 to \$5 per M. ft. in excess of the estimated through tonnage rate, after the opening of the canal. Large choice sizes of this timber can now be landed here at \$28 to \$30 per M. ft. and net the Pacific coast shipper a figure about equal to that obtainable in other markets. Manufacturers of spruce and yellow pine timber will make their own deductions.

Receipts for all classes of lumber continue light, but fully equal to the demand. In the skirmish for prices, the buyer continues to hold the advantage. The demand on the yards is limited, while their stocks are ample. Curtailed building operations are evidenced by the unmarketed supply of brick. It is estimated that there are now 750,000,000 brick available at the Hudson River sheds, while the output this year is far below that of any year since 1893. At New York docks there are now as many brick stored as is usual in the month of November, when navigation on the Hudson River is drawing toward a close. In consequence of the light demand in 1913, the brick making season on the Hudson will be the shortest on record.

It is anticipated that sixty days should note improvement. Within the month, a scattering few millions of laths have reached this market, and while there is no particular evidence of demand, an improvement to a \$4 price is quotable.

**One of the Best Opportunities in
Canada for Practical Lumbermen
with Moderate Capital**

We have a Saw Mill operated by water power, capacity about 40,000 feet B.M. per day of 10 hours, and two hundred and fifty million feet of standing timber, mostly fir and cedar, located in the interior of British Columbia on the Arrow Lakes, twelve miles from Arrowhead. Also car barge and tugs. Will sell the entire layout at a reasonable figure with moderate cash payment and fifteen annual payments for balance with six per cent. interest, or will lease the Mill including barge and tugs for long term on basis of annual rental, or will contract at a price per thousand for logging, manufacturing and loading on cars.

This is an exceptional opportunity for practical lumbermen with small capital to secure a going lumber manufacturing business on long terms.

The Retail Dealer and His Problems

The Value of Attractive Yards—The Salesman's Methods

Sightly and Unsightly Yards

In the development of human intelligence the object lesson is a most important factor. Through the sense of sight the mind receives its first and most of its intelligent impressions, and as it develops its chiefest source of thought material is received through the visual organs. The other senses are influenced largely through that of sight, and that which is pleasing to the eye affects in a large measure the impressions received through the faculties of the physical system.

There is nothing extraordinary or particularly interesting in the foregoing theorem. It is presented merely as a preamble to the observations made in the following description of things sightly and unsightly that are to be seen in the retail lumber yards of the country. In going about among them one finds much that is inviting to the eye and, at times, certain things that are repellant.

A Model Yard

One yard which may be used as an illustration of the high state of attractiveness to which an ordinary lumber yard may attain is owned and managed by a dealer in a suburb. It is a good-sized yard, employing half a dozen hands and keeps three teams on the move most of the time. Like its owner; it has a businesslike appearance and is neat and tidy, and in it there are lumber piles that command the respect of the observer. They have the appearance of "quality" lumber piles from which a customer would not hesitate to take a load without inspection.

Everything in this yard is in perfect order. The sheds are clean looking and well battened, and the various stocks in them are stowed away as trimly and precisely as matches in a box. Out in the yard the smaller piles are arranged in the most convenient positions, according to sizes and grades, and convenient to the office and gate are piles of moldings, in binders and sticks and topped by boxlike covers that extend well down over the sides.

The tops of some of the taller lumber piles are clamped down with wide boards laid crosswise and the projecting ends anchored with loops of rope around sticks inserted a foot or two below. Everything is snug and shipshape in that yard and it is kept so, no matter how busy the men may be hauling in or loading out.

Disreputable Lumber Piles

In strong contrast to the model yard described in the foregoing is one that is doing business in another suburb. It is a dry-rot looking establishment to which the term "dump" may fitly be applied. The lumber has a forlorn, abused appearance and the piles are thrown together. Ends project threateningly, like the overlong hatpins worn by the ladies, loose scraps of boards clutter the alleys, and the sheds have yawning cracks and a delapidated appearance generally. The lumber piles are thoroughly disreputable and the sheds and fences absolutely disgraceful.

This yard is run by a man who thinks he knows how, but it would be safe to wager long odds that were he to visit the model yard described, and compare notes with the owner, he would return to his ramshackle outfit and start right in to double his business, which assuredly he could do under a system of renovation and reform.

A lumber yard is much like a store of any kind in that it partakes of the characteristics of the person who runs it. A junk shop will have some semblance of tidiness if its proprietor is endowed with a sense of order. A grocery store invariably bears evidence of the manner of man that runs it. If he is the right man for the business the general appearance of his stock will proclaim it, but if he is not careful to keep his store clean and fresh looking his goods, though they be of the best, will go begging for buyers.

The Virtue of Advertising

It has often been said, and with much truth, that lumbermen are poor advertisers. As a rule retailers are indifferent to the advantages obtainable through keeping before the people. A small sign over the office door or on the fence is in too many cases made to suffice for the purpose of acquainting the public with the man and his business. In a small town where everybody knows everybody there is not much to be gained by a dealer who has the whole field to himself, but a card in the country weekly may be the means of bringing him an occasional order that will repay him many times over for the small outlay. In the larger towns where there is competition advertising is one of the first essentials to success.

An Example of Enterprise

An instance which will illustrate the efficacy of prompt and efficient service by the retail dealer is related of a yard owner who made

it a rule to have things "wrapped up" and ready to carry away. He was an energetic and active German, who kept constantly at it and made it a point to know just what people wanted in his line. He was, as is characteristic of his race, economical and conservative, but the business instinct being well developed in him he believed in advertising and was constantly on the lookout for something new in the way of a "trade coxer." Being inventive, also, he contrived various devices for attracting the attention of the people. He was in a three-yard town and had to "look alive" to get and hold his share of the trade, and, in the words of the city salesman, he was "Johnnie at the rat-hole." There were signs on his office, signs on his sheds, signs on his wagons, signs along the roads, and a sign in the local newspaper—and that was a very good sign. He made a "noise" with his signs. Like the lady of the nursery tale—figuratively—he had "rings on his fingers and bells on his toes."

As a result of this dealer's enterprise the trade came to him strong: He made his competitors scramble for a place in line. They took to making signs and dusting around for business. The town paper rejoiced in the spirited competition that sprang up between the three yards and dug up all kinds of display type, some of which was "fearful and wonderful to behold." When the building season set in the out-of-town buyers were waylaid on the road to market, and many of them bought lumber for which they had no immediate use, and had not thought of buying, for the reason that they could not evade the omnipresent reminders of the various uses to which good lumber could be put.

One of the devices that gave the resourceful German dealer a "hunch" on the other fellows was a bin or stall system for his steady customers among the carpenters and jobbers. He took orders by 'phone for odd stuff, such as mouldings, strips, thresholds, frames, battens, etc., and had them bundled and ready for the customer in the compartment assigned to him in a shed at the yard gate. This was a great convenience, for the carpenter could drive up with his road wagon, hop out and pick up his order without waiting for a yard man to do it for him. Such customers, of course, ran accounts and were billed by mail.

In the course of time—and a very short time—the German dealer had the whip-hand of his competitors in the trade, but they were forced to admit that he did it on the square. He did not slash prices nor resort to unfair methods; he was a "live wire" every minute of the time, and by unflagging effort and fair dealing built up a business that put him in class A among retail lumber dealers.

What a Young Salesman Should Know

Many a retail lumber dealer, after he has given an order to the traveller from a wholesale house, wonders just why he gave it to that particular traveller rather than to one of the numerous others who call upon him. It may not occur to him that the traveller is practising upon him all the arts of salesmanship that he has learned during his business experience. He is not likely to consider the traveller's part in the conversation which led up to the order, as being anything but an ordinary exchange of question and answer. Yet the traveller, who knows his business, is as conversant with the varieties of human nature, on its business side, as he is with the varieties of his lumber stocks. To show the retailer how a salesman looks upon this matter we reproduce an excellent article written by Mr. Harry Lewis, in a competition held by The American Lumberman. Mr. Lewis secured first prize for his article entitled "The Young Salesman; What He Should Know and Avoid." The article is as follows:—

A young salesman should thoroughly know the line which he intends to sell and believe in its merits, that his talk may command the necessary attention and respect of prospective customers.

Among the many other things that a young salesman should know are the values of honesty, tact, good appearance, and hard work. The first, honesty, is appreciated by everyone and is absolutely essential to successful salesmanship. Get your trade to have implicit faith in you and you have made a long stride toward gaining its favors.

A young salesman should exercise tact at all times. When approaching a customer be sure that you are not taking his attention from some other person, either salesman or his trade, as no one likes a "butt-in." When talking values be sure there is no one about who may overhear something that it is not intended for him to know.

Consider carefully your claim upon the customer's time. If he is

a busy man make your visit to the point, on a business basis, and if there is much visiting to be done do it at the luncheon table or after working hours, if possible, as in this manner the busy man will not dislike to see you call, even though not in the market for your goods. However, when you are entertaining a customer away from his place of business do not talk shop unless he starts it, as this robs entertaining of its value by making the customer think of the commercial rather than the social side of the meeting. Talk shop in his buying place.

On the other hand, there are customers who may be entirely at leisure when you call and who would welcome a friendly visit before getting into shop talk. With these, spend all the time that you feel their business may justify, as with them it is as much an error to be brief and to the point as it is to the contrary with the busy man.

In all instances be careful not to bore a customer by being over-insistent upon selling. Of course, there are some customers who seem to demand considerable persuasion, which should be given them, but even they arrive at a point where to continue means incurring their displeasure. There are buyers whose "No" is exactly "No!" and it is well to understand them the first time. With the customer who is quick to say, "I am not in the market," do not ask him if he is in the market. You thereby give him no chance to "put you out of commission" at once. Rather, tell him briefly of some of your bargains or suggest something that he would likely be interested in. If you do not strike it and he is yet in the market for something you have not enumerated, he will very likely tell you. Many times one of this kind is not exactly in the market, yet will buy a special, but if you give him the chance to say he is not in the market the chances are that you are through for that visit.

The Psychology of Selling

Know the seasons in which buying of different items is prevalent or advantageous to trade. Also, have the best "buys" at your command, that you may call the customer's attention to them without hesitation. Know your customer's inclinations, both in business and pleasure. If he has any special hobby, which we all have, get on and ride; it will inspire good fellowship.

Get acquainted with your customer's employees; for instance, the yard man in the retail lumberyard. He can do you a world of good or harm. Inasmuch as the yard man is constantly near his employer and is depended upon in many instances to make reports of stock received or stock wanted, he is in position to influence his employer to think favorably or otherwise of your goods and you. These yard men are very often fine fellows who are making their start in the lumber business and I have known many of them develop into buyers or proprietors of lumberyards. When this occurs you will be especially glad to have cultivated their friendship and good will. Besides, you will learn many things about the lumber business from these yard men who brush up against the actual user of lumber that will be of material benefit to you. Anyway, it pays to be a good fellow with people in general.

Avoid criticism of a customer's purchase from a competitor. For one reason, it is almost an insult to his intelligence, and another is he is likely to think that you are simply "knocking." There are ways to make comparisons of values much more effective than criticism. You can lead a customer to where he can see his mistake, rather than by telling him about it. Besides, who wants to be told of his mistakes?

Study Your Customer

A young salesman should know the manner in which his customer's business is transacted. If you are calling on a retail lumber dealer, make a study of the retail lumber business. Acquire all the knowledge possible pertaining to it, that you may be in a position to give information to your trade. It is easy to give information to a customer in such a manner that he may adopt some of the ideas for his own, and he will remember where those ideas came from. In making suggestions, it is only necessary to tell of some very successful dealer employing such ideas. Tell it in an offhand way; if it appeals to your customer he will remember and perhaps take advantage. Every time you help your customer you help yourself.

A young salesman should know that competitors in the same town are entitled to the same prices for the same kind of a purchase. If there is one thing that will make a customer sore forever and a day it is to learn that you have sold his competitor the same thing at a lower price than you have given him. This situation or difference in prices may arise in securing an order on a competitive basis, after having sold the first customer at your regular legitimate prices. For instance: A firm instructs you to sell at a certain price, with the privilege of shading the price a trifle when absolutely necessary to secure an order—a take-or-leave-it proposition. Such leeway is sometimes given a salesman on account of the firm wishing to move a certain item and not wanting to pass up an order for it on account of a competitor's lower price. This should be the only time when a difference in prices to two dealers in the same town, and on the same article, could arise.

Good appearance consists not only of nice attire, but manners,

language, courtesy, and cheerfulness. A young salesman should see that his clothes from hat to shoes are such as would be expected of a prosperous business man. Clothes enter largely into first impressions, and lend a certain amount of confidence to the wearer. Look successful; "success breeds success." Have confidence in your knowledge and ability, as it is very likely that you know more about your own line than the buyer, for while your study and time may be devoted to your line of business, the buyer may have several other lines that he is compelled to give equal attention.

For good manners' sake do not go into an office for the first time smoking. It may be offensive to the dealer or his employees. Many business men smoke but do not smoke in their offices. When you learn that a buyer makes a practice of smoking in his place of business a visit over good cigars is a good proposition, but be sure the cigars you offer are good ones. He is liable to judge you by the cigars you smoke. I have seen a salesman go into a customer's office with a cigarette in his mouth. A cigarette is a red flag to some men, even though they have used tobacco all their lives. A great many men have a healthy contempt for a cigarette, so avoid smoking them when soliciting business.

Command of English an Essential

Good language should be used by all salesmen. It is a sign of good breeding and intelligence. Avoid swearing. A framed saying I saw in a big line-yard man's office read: "Please do not use profane language, not that we give a damn but it sounds like hell to others." I have known where young salesmen have failed to make good with certain dealers on account of swearing in the dealer's presence. If you have to swear, do it in the woods, or your room.

Be cheerful; it is contagious. If you feel good and radiate good cheer it is a pleasure to have you call. If you feel "off" or grouchy your customer is likely to catch your mood and then your chances for making good with him are considerably lessened. I know a very successful employer of salesmen who instructs them that when they do not feel right to stay in their hotel until they get in trim, believing that a day spent in idleness is preferable to calling on trade when they can not appear to advantage.

Hard work is something of which the salesman can not afford to be afraid. A salesman may have all the necessary ability and requirements and yet fail by not working. Orders do not ordinarily come to salesmen; they have to go after them. Be on the job and work consistently. Do not be content with having done a good week's business in a day or two, but get just as much more than the firm requires. The salesman who is looking for the end of the week and his salary check is very likely to miss valuable orders. Do not be afraid of doing more than the required amount of work, as firms like workers. A firm will very often overlook a poor showing in volume of sales from a young salesman when it knows he is working hard to get the business, as it believes that a worker is bound to make good eventually.

Spare Time Advantages

Often salesmen have time on their hands between trains, and right here is where many salesmen lose by not taking advantage of this time in writing to their trade and soliciting business, using the long-distance telephone to talk with some nearby dealer on whom you will not call for some time. This time "waiting for trains" can be advantageously employed. Postage stamps and telephone tolls are small expenses when figured against the sales they will influence. When a salesman gets into a small town and finds that the buyer is out of the city, and that there is no train for several hours, drive to some nearby town if possible to make up for having missed the other man. Livery bills are much cheaper than your time and are acceptable to the firm. They mean more orders, and show the firm that you have the work habit. I have seen salesmen lying around hotel lobbies saying, "I got ahead of my route and am going to kill a little time." Such fellows are at the same time killing their chances of success. These fellows could just as well make some additional towns to those on their route and secure just so much more business. Before starting out on a trip it is a good idea to send out advance cards to your trade, stating the time, within two days, that you will call on them. Try to follow these cards as closely as possible, as you will find that many orders are saved for you. In event that you find it impossible to make your visit according to the advance card, phone or write the buyer informing him of the fact. Failure to notify buyers that you will be unable to call means that they will not put any dependence in your cards and will not save orders for you.

Time spent in writing to your trade is profitable. A buyer may be ready to place an order by mail, and your letter may be the means of influencing his order to you or your firm, especially if he thinks he is helping you personally. Buyers are good fellows and are kindly disposed toward the salesman who is trying to make good. Your letter makes the impression that you are a "live one" and after business and that you think of them in this connection.

Do not waste your time, but work. You can cultivate the work habit until work develops into pleasure and success.

EDGINGS

Ontario

The mill belonging to Mr. John Glass at Church Bay, near Bracebridge, Ont., was recently destroyed by fire, together with the contents and 150,000 feet of lumber.

The Abitibi Pulp and Paper Company, Iroquois Falls, Ont., are reported to have decided definitely in favor of erecting a plant for the manufacture of paper, as well as a pulp plant.

The estate of Jas. Davidson, Ottawa, Ont., will cut 15,000,000 feet of lumber this year, 3,000,000 feet more than last. Other Ottawa firms have announced their intention for cutting more heavily during 1914.

Work has been started on the erection of a planing mill by O. C. Teal, at Bridgeburg, Ont. The building will cost \$12,000. The former mill, with a stock of lumber, was destroyed by fire several weeks ago.

The planing and lumber mill owned by Levi M. Bowman at Berlin, Ont., was totally destroyed by fire early on September 3rd. A large quantity of lumber was saved. The cause of the blaze is unknown. The loss will be \$4,000.

The Kensington Furniture Company plant at Goderich, Ont., was recently destroyed by fire. The loss was about \$40,000, mostly covered by insurance. The cause of the fire is supposed to have been spontaneous combustion in the finishing room.

The planing and lumber mills of Levi M. Bowman, near Heidelberg, eight miles north of Berlin, Ont., were burned to the ground on September 3rd. The large piles of lumber were saved. The loss is estimated at \$4,000, partly insured. Mr. Bowman will rebuild immediately.

The Petawawa Lumber Company, Pembroke, Ont., expects to take out 7,000,000 feet of lumber in the season of 1913-14. The logs will be cut in two camps in the Brule Lake section, driven from the head waters of the Petawawa to the Ottawa river towed to Pembroke, and sawed in the mills there.

The new news print mill of the Minnesota and Ontario Power Company at Fort Frances, Ontario, is nearing completion and will be in operation in the near future. There are two machines, each with a width of 186 inches. The operation of the plant will be a great benefit to the Fort Frances district, affording the farmers and settlers a ready market for their pulp wood.

The Ontario Department of Lands, Forests and Mines, has sent Mr. G. W. Bennett, Superintendent of Colonization Roads, into the Larder Lake and Porcupine districts to look into a proposal for clearing the log jams on the Driftwood and Montjoy rivers. The Department intends to make these rivers navigable in view of the establishment of pulp mills at Iroquois Falls.

The timber mill belonging to J. R. Booth at Ottawa, which was rebuilt three years ago, was destroyed by fire on September 7th, the loss amounting to \$100,000. The origin of the fire is a mystery. The mill contained a splendid equipment of new machinery. No other buildings in the large plant were damaged. The fire has thrown 300 men out of employment. The mill will be rebuilt at once and will be of concrete and fireproof construction.

Two tenders were received by the Ontario Department of Lands, Forests and Mines for the burned timber in the township of Gooderham, along the line of the T. and N. O. Railway. The larger tender, which was accepted, was put in by the Pembroke Lumber Co. at \$14.40 per 1,000 feet, and \$2.00 per 1,000 stumpage dues. The other bid of \$8.26 per 1,000 feet was submitted by the J. J. McFadden Co. of Renfrew. The burned area off which the timber is to be taken covers 15 3/4 square miles.

The Board of United States General Appraisers at New York has decided in favor of admitting free of duty into the United States mechanically ground wood pulp and printing paper manufactured by the Spanish River Pulp and Paper Company from Crown land wood. This decision is the outcome of an agreement between the company and the Ontario government, under which the government removes the export restrictions, in return for a promise from the company to turn out 50,000 tons of pulp and paper per annum. The decision is an important one, as a number of other Canadian companies in Quebec and British Columbia are in a similar position.

The Ontario Paper Company has commenced manufacturing at its new plant at Thorold, Ont. When the machines were tested out they were found to be in excellent condition. The capacity of the plant is 50 tons of news print per 24-hour day, all of which has been contracted for to the Chicago Tribune. The plant is one of the most modern in existence, the equipment including two Bagley Sewall machines making sheets 205 inches, deckle edge. Twenty of the latest type grinders have been installed. All the machines are run by individual motors, the power being obtained from the Ontario Power Company, at Niagara Falls. The company obtains power at the cheap rate of \$9 per h.p. for continuous service.

Eastern Canada

* The new plant of the Howard Smith Paper Company at Beauharnois, P.Q., is now in full operation.

The cooperage plant of Mr. F. X. Paxton, Montreal, has been destroyed by fire. The building was a very old one, and was burned out, the stock and machinery being also ruined by fire and water.

Carriere and Frere, Cie, Ltd., 31 Laurier Ave. East, Montreal, are considering plans for the erection of a sash and door factory. They are now looking for a site and intend to erect a complete plant.

The sash and door factory belonging to La Cie, Manufacturiere de Jonquieres, was recently destroyed by fire. The loss amounted to \$20,000, on which there was insurance of \$4,000. The company will rebuild and will be in the market for machinery.

The firm of Graddon and Owens, lumber merchants, Montreal, has been dissolved, and re-constituted consequent on Mr. James Buchanan being ad-

mitted a partner. The firm now consists of Mr. Buchanan, Mr. C. B. Gradon, and Mr. W. T. Owens.

A small lumber yard belonging to R. Macfarlane and Company, Limited, sash and door manufacturers, Montreal, was recently damaged by a fire which started in the Canadian Sheet Metal Company's premises. Lumber to the value of \$5,000 was destroyed.

The Saguenay Mills, Limited, 223 St. Ambroise street, Montreal, P.Q., have started work upon extensive alterations to their excelsior and box factory. Premises have been purchased near the present buildings which are being altered. The work will cost about \$6,000.

Another fire occurred recently at the sash, door and carriage factory of F. Tremblay & Co., Montreal. On August 15th property to the value of \$25,000 was destroyed, and the second fire caused a loss of \$5,000. The damage, in the second instance, was confined to the first floor.

La Compagnie Ouellette Beaulieu Limited, Montreal, Que., has been incorporated with capital stock of \$45,000 to carry on a general lumber business. Among those interested are Joseph H. Ouellette, of Longueuil, and Frederic Beaulieu, Montreal. The head office will be at Longueuil.

Luther B. Smith, whose mill at Blissville, Sunbury County, N.B., was destroyed by fire some time ago, will probably erect a mill at Gagetown, N.B. His intention is to erect a band saw mill with rotary equipment as well, also a shingle plant and planing mill. The capacity of the mill will probably be about 50,000 feet per day. Mr. Smith owns timber limits on the Nerepis.

John Kennedy, of Montreal, the well-known authority on water powers and river levels, recently visited Kenora, Ont., to study the water power development there. It is understood that he has been acting for J. T. Jaeger and B. Nichols, Jr., of International Falls, in connection with the proposed establishment of a pulp mill at Kenora by the Backus interests, of Minneapolis, who have an option on the power site.

The Pokiok Land and Water Company, Limited, Dumfries, N.B., are applying for incorporation, with capital stock of \$99,000. Those interested in the company are Dr. and Mrs. Alexander, C. Hagarthy and H. B. Moore, of Ellsworth, Me., Dr. R. E. Hagarthy of Sedgewick, Me., and A. R. Slip, M. L. A., and R. B. Hanson of Fredericton, N.B. Several years ago the Hagarthys bought the property of Gilman Bros. and Burden, including their mill at Pokiok. Since then they have purchased other holdings and now own about 18,000 acres in York County. Mr. H. B. Moore is manager of the company.

The Victoria Mills recently acquired by Fraser, Limited, Fredericton, N.B., which were remodelled during the past summer have now been put into operation. The plant has been converted into a bandsaw mill and is one of the most up-to-date lumber mills in eastern Canada. A planing mill and shingle mill are also being completed. When these are also working the plant will employ about 100 men. The remodelled mills will have a capacity of about 80,000 feet of long lumber per day. It is proposed to manufacture about 6,000,000 feet of lumber this season. The plant will be in operation until very late in the fall, and part of it may be running nearly all winter. Mr. W. J. Glenn is manager of the Victoria Mills for Fraser, Limited.

The Smith Lumber Company, Woodstock, N.B., of which Mr. W. M. Smith is the proprietor, have rebuilt their mill which was destroyed by fire on April 26th. The new mill commenced running about the first of September. The plant is one of the most modern in the province and gives employment to about thirty men. The mill is 120 x 32 feet, with a lean-to of 40 x 12 feet and boiler house 22 x 36 feet. Power is obtained from a 100 h.p. engine made by the Robb Engineering Company of Amherst, N.S. The machinery includes a gun-shot rotary, gang edger, single machine, lath machine, surface planer, and barrel heading machine. The rotary was furnished by the Madison Williams Company, Lindsay, Ont., and is of the Lane pattern. The same company furnished the barrel heading machine. The edger was manufactured by the American Sawmill Machinery Company, being purchased through its Canadian agents, the Canadian Fairbanks-Morse Company. The shingle and lath machines were furnished by Connell Bros., Ltd., Woodstock, N.B. The mill has a capacity of between 30,000 and 35,000 feet per day of long lumber, 13,000 shingles and 20,000 lath. The barrel heads are made from wood which would otherwise be wasted, and which formerly was used for fuel.

Western Canada

The Reliance Sash & Door Company's interests have been absorbed by the Imperial Timber & Trading Company of Vancouver. The new board comprises: President, E. L. Kinman; vice-president, T. Frank Paterson; general manager, R. B. McKamey; treasurer, George P. Challenger; secretary, H. G. Ross.

A despatch from Grand Forks, B.C., says that lumbermen in the Boundary district anticipate a heavy demand for building material in the near future in view of the exceptionally promising crop situation. Among the projected undertakings is one for the erection of a pulp mill as soon as the necessary financial arrangements can be completed.

The Dominion Development, Limited, has been incorporated in British Columbia, with head office for the province at Victoria, B.C., and general head office in London, England. G. H. Williams, Victoria, B.C., is attorney for the company. The capital stock of the company is £50,000. The objects include the carrying on of business as timber merchants, lumbermen, sawmill proprietors, etc.

The Armstrong-Kerr Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of \$50,000, to take over from W. Armstrong, Norman Kerr and others a contract for supplying sawdust briquetting machinery to the British Columbia Mills, Timber & Trading Company and to acquire agencies of all descriptions from Messrs. Armstrong and Kerr. Among the powers included in the incorporation are those of carrying on business as sawmill owners, timber and lumber merchants, etc.

James F. Garvin, 198 Hastings street, Vancouver, B.C., on behalf of the receiver appointed by the trustee of the debenture holders of the Western Paper Mills, Limited, gives notice that tenders will be received up to and including the fifteenth day of October, 1913, for the purchase of the said company's premises, plant and undertaking, consisting of a fully equipped paper mill in running order. The mill has been in operation fourteen months, making board sheathing and wrapping papers, and has an eighty-four inch four cylinder machine.

Veneer Machinery

THE "MERIT" LINE of Veneer Cutting, Dimensioning and Drying Machinery is designed first, for veneer mills cutting high grade furniture and commercial veneer from expensive timber, and second, for basket, crate, box and barrel factories using cheaper veneer cut from the less expensive woods.

Merit Veneer Lathe

In addition to Lathes, Clippers, and Driers, the line includes Knife Grinders, Log Hoists and Trolleys, a set of Crate Head Machinery, a set of Barrel and Basket Hoop Machinery, Basket and Hamper Bottom Rounders, Nailing Forms, etc.

PEAVIES

Cant Hooks, Boom Chains, Timber Dogs

It is time to think about your logging equipment for the ensuing season. Let us figure on your requirements for Peavies, Cant Hooks, Timber Dogs, Boom Chains, and Shackles, Mill Chains, Forged Steel, Log Stamping, Hammers, etc.

Our products are the result of over 50 years of careful study of the lumberman's requirements and we can offer the best equipment at the lowest price.

The Three Goodhue Belts

"EXTRA" "STANDARD" "ACME WATERPROOF"

These three brands are made for three different services and each brand is the best quality made from selected hides with the stretch taken out.

"Goodhue Belts" stretch less than any other belt by 15 to 25 per cent. This quality effects a great saving because it is unnecessary to be continually shortening the belt to keep it taut.

"Acme Waterproof" brand is made for the wet places in a mill and will give a remarkable service under the most trying conditions.

When you buy a belt—buy a Goodhue. Prices and particulars on request.

1	15	96
14	16	171

by using our
**Patent Steel Band
Mill and Carriage**

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

Shimer Cutter Heads and Cutters!

Fig 627

Fig. 628

The "Shimer Limited" with Expansion, price \$72.46 per set, complete.

The Tools You Need

You will eventually realize that the Shimer Limited Cutter Heads are the tools you need to increase your output without sacrificing quality or increasing expense. You will find that the mills that are using them are perfectly satisfied and will give testimony to this fact.

We don't see how it could be otherwise. We have studied planing mill conditions for forty years and have kept pace with the changing conditions by designing tools that were safe, that were efficient, that were profitable to use because time and labor saving, that were lasting and that sold at low prices.

The Shimer Limited Cutter Heads sustain and enhance the reputation built up by our other tools. In addition to the special features which have made the Shimer Cutter Head famous, these new fast Feed Heads have a self-centering device which clings to the spindle when drawn up, securing it firmly thereto. The bit seats also carry a larger surface and the bit chambers are of greater depth to compensate for the new acute angle given to the Bits for greater relief to all parts coming into contact with the lumber. The Spindle gripping device is not only positive and effective in its purpose of holding fast to the spindle, but it also centralizes the Head on the spindle for a more uniform action of the Cutters.

The results of all cutters cutting is a smoother finish, notwithstanding the faster feed and an output far in excess of former methods.

If you have a machine that will swing Heads of 6 3/4 inches diameter and feed over 150 lineal feet per minute, we would like to send you a set on 30 days' trial.

Take the measurements now and let us have your order at once.

Popular Cutter Heads

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set . . . \$40.95

Price with 6 bits to each head, the set . . . 49.27

Price with 8 bits to each head, the set . . . 57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling—3/8 at \$1.30 each and Bits for 2-in. thick plank at \$1.63 each.

Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, 1 1/4-in. \$31.20

Price, with 4 bits to each head, the set, 2-in. 33.28

Ship Lap Heads

to give you the best service must be of a kind that is always ready and in interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, 1 1/2-in. thick, \$34.84

Price, with 4 bits to each head, the set, 2 1/2-in. thick 35.88

Double Ceiling Heads

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance and to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price, Double Ceiling heads complete with Bits, net, \$40.94

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

Reversible and One Way Cutters

The Shimer Reversible Cutters for Single Spindle Shapers, Variety Moulders or Friezers, are carefully moulded opposite to the shape of the mould to be produced, in such a way as to have only the cutting edge touch the lumber. They are complete—inexpensive—time saving. We also make One-Way Cutters for the Double Spindle Shaper.

Thin Steel Knives

Advanced ideas referring to the planing and surfacing of lumber have developed into the use of thin blades, made from high speed steel, which when properly tempered and treated, serve for one or two days of work on hard maple, oak or hickory.

These blades are known as our Bedee Knives and are recommended by users as the best that can be procured. For the benefit of those desiring to use this style of a knife we have facilities to furnish them in any length or thickness.

Write us about your requirements.

Samuel J. Shimer & Sons

Milton, Pa., U. S. A. Galt, Ontario, Can.

The New **Hanchett Swage Shaper**

For Bands, Gang Circular and Cylinder Saws

Is a Shaper that you will like and swear by. It has the simplicity, adaptability and efficiency that you have been looking for in a shaper. The instant you look upon it, it impresses you; when you put it upon your saws and feel how easily it slides from one tooth to the next—not a hitch nor a catch except when it is flush in the tooth stop; when you feel the perfect balance and note the perfect alignment of the teeth; the simplicity and perfect adjustments throughout—it appeals to you. When you see the efficient work produced—it convinces you, it captivates you. WHY? Because it is made to suit you; to fit you; to meet your requirements, after we have given nearly a quarter of a century to the study of your needs.

Note the cuts shown herewith. Note the lateral adjustment of the tooth-stop by means of a conveniently located knurled screw; the straight up and down adjustment of both the tooth stop and back rest; by the same means. With this construction, no adjustment is necessary in changing from short space to long space teeth. Note the manner in which the tooth-stop is held—a groove at the side and the adjusting screw at upper corner, thus there is no obstruction of any kind in the line of travel of the saw from back to front except at point where tooth engages tooth-stop. This insures a free riding shaper and a positive stop at the desired point. Note the action of the dies, controlled by a centre control lever giving balance to the shaper and causing the dies to move in unison against the tooth. you will find this shaper 100 per cent. efficiency. Wouldn't you like to know more of this new shaper?

Write for one on 30 Days' Approval, to be returned if it isn't the best shaper you have ever used.

Here is what you've been looking for, MR. MILLMAN:

A medium priced general purpose Matcher with Profiler and all the other features of the biggest machines.

"FAY-EGAN LIGHTNING" No. 159 Matcher Profiler

You know the advantages of the fast feed matcher with round heads and "Tungsten" air-hardened steel knives; and of the even greater advantages gained by putting your pattern stock through such a machine equipped with a Profiler.

You know, too, of the time-saving value of the Jointing and Grinding devices on the machine, of the power saving value of the silent running all cut gear drive.

The initial cost and enormous capacity of a "333" then is what has held you back. We now offer in our No. 159 Matcher-Profiler fitted with round heads, thin steel knives, grinding and jointing attachments and other "333" features, a general purpose machine within reach of any mill owner, of sufficient feeding capacity to manufacture lumber on an efficient basis, and in sizes from 10" to 30" wide by 8" thick to meet all requirements.

Here is the machine you have been looking for—a medium priced Matcher-Profiler that will put you in position to compete successfully with other manufacturers—a machine that will give you a maximum manufacturing product. Ask us about the No. 159.

If you use
Cross-Cut Saws
you should have
this book

It contains valuable information on the "fitting" of Cross-cut Saws; shows the action of the Raker Tooth, and explains how it leads to faster cutting. It also illustrates and describes the different popular types of Disston Cross-cut Saws.

It will aid you in selecting the proper of tooth and saw for your particular work for there is a Disston Crosscut Saw to meet every condition. After reading this book you can better understand why Disston Saws are found in most of the lumber camps of the world, and why they

RUN EASIEST, CUT FASTEST AND LAST LONGEST

All F.O.B. Jamestown, New York.

A Simple Test that Demonstrates the Action of Cling-Surface

Fasten any ordinary small pulley in some convenient position and grip an untreated belt. Next grip the pulley with bare hands only and then try the same thing with a Cling-Surface treated belt. You can easily feel the decided difference in resistance to slip.

It is simply a matter of contact. The untreated belt, being hard and inelastic can't be expected to conform perfectly to the pulley face, while the bare hand, being moist and soft and yielding takes equally effective hold over all area covered. Similarly a belt treated with Cling-Surface becomes pliable and moist so that it offers the same high resistance to slip, but is never sticky on the surface. Cling-Surface imparts to and maintains the soft velvety cling in, but leaves no deposit on, the belt surface, hence there need be no collection of dust or forming of lumps. Further, the prevention of slip is accomplished by cohesion, not adhesion. The belt leaves the pulley without effort after contact, which is in marked contrast to the action where a sticky preparation holds pulley and belt together at the expense of power loss and injured belt surface in tearing them apart.

Cling-Surface can be tried at our expense. Its real value shows up in a hurry and the far reaching results are certainly worth investigation. You will be well repaid by at least sending for literature. Remember that we quote f.o.b. Toronto.

600 Sets Payette's Famous Patent Mill-Dogs Sold

Why?

- Because (1) They will dog with perfect ease and safety in any class of timber.
(2) Will dog just as easily, frozen maple or hardwoods of any description.
(3) Will dog the last board, just as easily as they dogged the first one.
(4) They do not tear the board or stock.
(5) Many other reasons, too numerous to mention here.
Write us for full particulars and booklet on same.

Fig. 1.

We also manufacture the following High-Grade Saw-Mill Machinery;—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer; P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders Valves. Five different class and style of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.

Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.

Descriptive Booklet and prices mailed free upon request.

Getting Acquainted

THE best method we have for "getting acquainted" with a man is through a Leviathan Belt. When he has put that belt into use, and watched it day after day—then we know each other better; he has faith in us and our goods—especially if he compares his "Leviathan" with some other belt.

Main Belting Company

MONTREAL

of Canada, Limited

Two Factors With Which You Are Familiar Regulate Timber Values

Supply—it cannot increase during the life of this generation.

Demand—for wood and wood products will not decrease during the life of this generation, if ever.

Caught between these two forces which are moving toward each other steadily, timber values literally are being

Shoved Up

by the pressure behind them.

For these reasons timber is a good investment whether bought for present or future operation or as an investment.

Timber now is being offered at prices which will make your investment profitable, not in many years but a few years.

You are entitled to information about timber bargains. Ask for it.

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited
ORILLIA, ONT.

THESE HEADBLOCKS WILL WEAR

They are of new design, gotten up specially to withstand the jarring of heavy niggers, and they will stand the strain of the hardest work.

About twenty of them have been tested in mills all over the country since the beginning of the present sawing season, being thoroughly tried out.

The service they have given marks them as great headblocks well worth your while to investigate. May we send particulars?

William Hamilton Company
Peterborough, Ontario

A STANDARDIZED MATCHER

The Berlin "91" is now a standardized machine.

Standardized in design, construction and speeds of feed.

Berlin Engineers have done all that is possible to make the standardized "91" a producer, not only of the greatest quantity, but of the best quality of lumber.

Limits of Practical Production

It is now producing at 300 feet per minute. That is the limit of practical production of a high quality of lumber with the best present methods of supplying rough stock and offbearing.

Faster production would cost as much as output at under 100 feet per minute, because of increased cost of feeding and offbearing, grading, etc.

It does not now seem probable that good lumber will ever be manufactured at faster feeds than the "91" is now producing it. Consequently Berlin Engineers turned their attention to making the "91" as good as it could be made.

Final Improvements Made

Every feature was studied thoroughly, its working record investigated in a hundred different mills. Faults were hunted out and corrected. Every suggested improvement was considered, tried, adopted when it increased the efficiency, the working value of the machine as a whole, abandoned when found impractical.

All of this work brought out refinements of design and construction tending towards standardization. A part reinforced here, another re-designed there, when high efficiency could be gained; every move meant longer working life,

greater ease of operation, improvement of the grades of lumber produced.

More and Better Service Results

And now that it has all been done, we offer you a standardized Matcher, Standardized in every part. This machine will still be our "91," But it will be a "New 91." Its features are modelled after and practically identical with the original "91"; but it is a tool of which more and better service as well as greater durability, may be expected.

Every operating convenience is on this new "91." More adjustments are made automatically than on any other matcher ever built. It carries the benefit of the total experience of hundreds of Matcher-Profiler users in its final designing.

Matchers Scheduled to Our Limit

A definite number of new "91's" will be built this year. We have scheduled this machine to our limit. We will now put out hundreds of machines after one approved standard design. Standardized manufacturing on that scale means cheaper production of every part, and every part reproduced over and over again, as well a part of one machine as of another.

But we can build no more than we have on schedule.

We urge investigation of this tool as early as possible.

Deliveries will be made in the order that contracts are made.

Ask for an early demonstration.

BUILT FROM EXPERIENCE

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service and often in localities where repairs cannot be made without great inconvenience.

When you want a locomotive you cannot afford to overlook the experience of this company.

Experience in building large locomotives is invaluable in connection with the design of smaller ones in order to insure reliability which is the main question in logging work. You know what delays cost you.

WATEROUS Steel Carriages are being used in the largest, best equipped Mills in Canada to-day. Built for fast cutting, for accuracy, and to give operating service, they are carefully put together of the best materials obtainable—they stay right.

INCREASE in cutting efficiency and the increase of cutting speed have been taken care of in the design of these Carriages. Improvements in the knee and head blocks and in all moving parts to overcome lost motion; a new Setworks—our No. 4—which absolutely prevents and will not develop slack; new style, inserted tooth, quick and easy operating dogs; a friction receder that

is operated with the Setworks—these special features are what keep the Waterous Steel Carriage at its place at the head of the list of "Up-to-date Sawmill Equipment." We build our Steel Carriages in sizes of 36" to 72" knee opening in any length and with any number of head blocks—screw or rack motion. They are adaptable for rope or gunshot feed.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |
| | POWER PLANT |
| | 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| | 2 Double Duplex, high pressure Water Pumps. |
| | 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| | 2 125 h.p. Water Wheels. |
| | 1 Upright Engine for sawdust conveyor. |
| | 1 10 h.p. Engine. |
| | 1 Mitts & Merrell Hog. |
| | 1 Wood Machine for 22-in. wood. |
| | 1 Wood Machine for 16-in. wood. |
| | 1 Edger for ripping dry lumber, installed. |
| | 1 Edger for ripping dry lumber, not installed. |
| | 1 30 h.p. Generator, 250 volt. |
| | 1 30 light arc generator. |

FILING ROOM

- 1 Automatic Filing Machine for 12-in. D.C. band saws.
- 1 Automatic Grinding Machine for 8-in. S.C. band saws.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

When the gang draws pay for loafing

THE Millman who is studying for efficiency must see the waste in using Belts that go wrong—tying up the whole outfit. He must see the waste of precious time—which is money. He must also see the loss entailed by a gang being thrown off work, but not off the pay roll.

A cheap belt piles up a bill of expense that may seem purely incidental—but which is directly attributable to poor belting.

A belt runs slack and must be fixed—stopping an expensive machine, wasting the men's time which runs quickly into money—often falling down on deliveries and losing business.

A Goodyear Belt will not run slack—Because it will not *stretch*.

In the making of Goodyear belting, the many plies of hard-fibre cotton duck—each thoroughly permeated with rubber “friction”—are compressed into a solid combination of strength and grip.

The Goodyear “curing” or vulcanizing is done while the Belt is stretched to its utmost limit by special machinery. All tendency to stretch in service is taken away. That is why Goodyear Belts do not *stretch* in service.

The toughness of carefully-tested cotton fibre, inseparably united under tremendous pressure with high-grade rubber friction, makes a pliable Belt of great strength.

GOODYEAR BELTS

Goodyear Belts grip the pulleys. They convey **ALL** the power because they do not slip. The outer surface of rubber holds tenaciously to the pulley. The belt is pliable under any weather conditions.

This rubber covering protects the inner fabric of the Belt from rain, oil, etc., which would cause rot and decay.

Neither heat nor cold, rain or shine, can affect the pliability and effectiveness of our Rubber Belts. They remain soft under the hardest service. Repeat orders from millmen, and big increases in sales, prove that they are satisfying the demands of experienced men.

SIMONDS CANADA SAW COMPANY, LIMITED

St. Remi St. and Acorn Ave., Montreal, Que.

Vancouver. B. C. or St. John, N. B.

Yes they are famous because they have been giving such universal satisfaction to Lumbermen and Loggers for so many years and in so many different parts of the world.

Crescent grinding and Simonds Steel is a combination that makes the best edge-holding, even tempered, well wearing cross-cut saw that the skill of man has yet been able to produce.

Price is not the factor; it is only results that count in making this the most economical saw on the market.

The Cost of Lumber Production

can be reduced to the minimum if care is exercised in the selection of the machinery. For years

KNIGHT'S SAW MILL MACHINERY

has been known to lumbermen as the Quality Line that makes for efficiency in lumber production — better lumber at less cost.

The style "S" mill shown herewith is built as a single mill only, and is especially recommended for cutting out small tracts of timber. Its size permits of easy transportation from tract to tract.

Full details of this mill and our entire line is given in our catalog. Write for a copy.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 33

Toronto, October 1, 1913

No. 19

Lumber Insurance Alterations

From information which the Canada Lumberman has recently obtained from a thoroughly reliable source it is learned that the Canadian Fire Underwriters Association is seriously considering the question of altering the rates upon lumber and sawmill risks, with a view to avoiding such serious losses as have occurred during the past few years. In the case of sawmills, the Underwriters have prepared statements showing that during the last few years, excluding 1913, the loss on sawmills has amounted to eighty per cent. of the premiums and that during the present year the percentage has been even higher. This, they claim, involves a loss to the insurance companies because the business cannot be done on a margin of twenty per cent.

Enquiries are now being made into the best methods of altering this situation from the point of view of the insurance companies. Two remedies suggest themselves to the Underwriters. One is an increase of the base rate for insurance upon sawmill and lumber risks. The other is the tightening up of the schedules in such a way as to educate policy-holders into taking greater precaution against fires. This latter method appears to the underwriters as the logical one under the circumstances. If anything is to be done it is also the method which will appeal to the lumbermen themselves. Information which the Canada lumberman has secured indicates that lumber manufacturers and owners would not listen for a moment to any proposal for increasing the base rate of insurance upon their risks. They would be likely, however, to co-operate as fully as possible with any proposal which would assist them in the prevention of fires upon their properties. By increasing the charge for neglecting various important precautions for the prevention of fires, it is probable that the desired effect would be obtained. The loss ratio would be reduced in

connection with important risks and the cost of insurance to the insured would be no greater.

One of the important precautions which the underwriters have in mind is that of employing a capable watchman and keeping loiterers out of the yards and plants. Some heavy losses which have occurred of late are said to have been the result of failure to enforce one or other of these precautions. It is likely that the underwriters, in drawing up a new schedule, would consider increasing the charge for risks on which satisfactory attention is not given to these features.

Another important matter which the underwriters are considering seriously is the amount of insurance carried upon lumber stocks. Under present conditions, lumber stocks are insured according to their market value. A man whose stocks are completely destroyed thus makes a very satisfactory profit, according to the ideas of the insurance companies. The underwriters are now considering a proposal that lumber stocks should only be insured up to ninety per cent. of their market value, this ninety per cent. to cover the co-insurance feature if the policy includes one. In this way the companies hope to leave with the insured, a greater interest in the safety of his stocks.

None of these matters have as yet come to a head, but the underwriters are making careful investigations into the situation and will in all probability be prepared in the near future to make the changes which they consider necessary. Lumber manufacturers and dealers will therefore be well advised to give this matter their careful attention, holding meetings if necessary to discuss the situation and be prepared to protect their interests in any way that may become necessary.

Few Forest Fires This Year

Canada has not alone been fortunate during the present year in escaping serious loss by forest fires. The middle of September practically brings the fire season on the United States national forests to an end and this year there has been less damage than in any previous year recorded. The immunity from loss has been due to two principal causes, partly to a favorable season, but largely to a much better organization for fire prevention than has been attained heretofore. The effectiveness of the organization is shown particularly by the fact that while there were in all approximately 2,260 fires, as against 2,470 last year, yet the area burned so far this year is only about 60,000 acres as against 230,000 acres in 1912, and 780,000 in 1911.

A single administrative district, which covers the intermountain region of southern Idaho, western Wyoming, Utah, Nevada, and western Arizona, gives an example of the most favorable situation. Only 43 fires were encountered, 29 of which originated in Idaho. The total area burned over amounted to only 956 acres, which is considerably less than four one-hundred-thousandths of the total area patrolled by forest officers in these states. California, Arizona, and New Mexico have suffered most during the past season. The various causes of fires have not changed greatly in their relative proportions. Railroads and lightning head the list, with campers next. There has been, however, a marked decrease in the matter of fires caused by burning brush, which, according to the forest officers, indicates a closer co-operation with the settlers in and near the forests and with timberland owners in fire prevention and control. It is still true, nevertheless, that a large proportion of all fires started are due to human agencies and may generally be charged against carelessness. Fires caused by lightning are, of course, not preventable, but the system of lookouts by which they may be detected immediately after being set is greatly lessening the loss from this source.

The importance to the lumberman of the improved methods of preventing forest fires, is widely recognized and the results of the last two years are looked upon generally as giving promise of much more efficient protection in the future than in the past.

Trade With Great Britain

A statement recently issued by the British Board of Trade deals with the trade in paper and pulp between Canada and the United Kingdom for the year 1912. Its chief interest lies in the fact that it

illustrates the gradual decline in the interest which Canada has been taking in the British paper market, so far as newsprint and writings are concerned. Apparently Canada's place is being taken by Scandinavia and Germany. The total imports of paper and boards in 1912 was 294,786 cwts. valued at £137,584, as against £141,137 in 1911, £182,739 in 1910, £221,226 in 1909, £229,932 in 1908 and £155,172 in 1907. Paper for printing and writing was imported from Canada to the following extent:—1912, 77,015 cwts. valued at £41,594; 1911, 99,545 cwts., £55,811; 1910, 186,881 cwts., £92,691; 1909, 326,141 cwts., £161,790; 1908, 343,434 cwts., £179,934; 1907, 215,440 cwts., valued at £104,178. Strawboards, mill and wood pulp boards were imported from Canada as follows:—1912, 217,771 cwts., valued at £95,990; 1911, 193,862 cwts., £85,275; 1910, 199,276 cwts., £90,008; 1909, 132,387 cwts., £59,294; 1908, 122,667 cwts., £52,998; 1907, 107,282 cwts., valued at £48,605.

From these figures it will be seen that Canada's exports of newsprint and writings have fallen off rapidly during the past six years,

but that exports of boards to the British markets have increased. This increase however, is small compared with those of Holland, Belgium and Germany. Exports of printing and writing papers from Great Britain to Canada were valued at nearly £300,000. The figures for the five preceding years were as follows:—1911, £233,063; 1910, £218,738; 1909, £169,164; 1908, £130,265; 1907, £152,126.

Exports of wood pulp from Canada to the United Kingdom have shown remarkable fluctuations; the figures for the last six years being as follows:—1912, 43,398 tons valued at £102,102; 1911, 33,563 tons, £75,189; 1910, 69,739 tons, £161,779; 1909, 108,336 tons, £284,172; 1908, 98,791 tons, £286,455; 1907, 64,548 tons, valued at £168,793. These figures cover both mechanical and chemical wood pulp.

Newfoundland's exports show remarkable gains, the figures being as follows:—Paper: 1912, 790,633 cwts., valued at £394,764; 1911, 523,116 cwts., £264,562; 1910, 340,365 cwts., valued at £101,362; 1911, 30,454 tons, £75,562; 1910, 340,365 cwts., valued at £31,463. No figures are recorded beyond 1910.

British Columbia and the Panama Canal

An interesting analysis of the shipping situation which will develop out of the completion of the Panama canal, so far as it effects the lumbering industry on the Pacific coast, both in the United States and Canada, was recently given by Mr. Robert Dollar of San Francisco, Cal., the widely known and remarkably successful lumberman. Mr. Dollar is remembered by many Canadian lumbermen because his first experiences in the lumbering industry were obtained in the Ottawa Valley. He was engaged later on, on his own account, in the Muskoka District. For some time he was manager of the important lumber interests of Mr. H. H. Cook. In 1888 he transferred his interests to the Pacific Coast and, from that date to the present, has enjoyed remarkable success. In a recent issue of the American Lumberman, Mr. Dollar discussed the Pacific Coast shipping situation, via the Panama Canal as follows:

"We need only consider the movement as being from west to east. No doubt some yellow pine and hardwood will move from east to west, but the volume will be comparatively small. A great deal of uncertainty exists on this question. As it is one largely of shipping I will endeavor to show the situation from that viewpoint.

"Commodities can be carried profitably in small steamers a short distance only. The greater the distance the larger the vessel required. For example, a vessel carrying 500,000 feet of lumber could not profitably be run a greater distance than 750 miles. I have experimented with different sized vessels between Puget Sound and China, the distance being about the same as to New York via the Canal, and found that three millions would be a minimum, and any cargo up to five millions is much more profitable.

"Among the American vessels engaged in the lumber trade on this Pacific coast there is not one large enough. The new steamer John A. Hooper is the largest, and it carries only 2,250,000 feet, and among the ordinary cargo boats, outside of the regular lines, I do not know of a single available vessel, so that lumber carrying will have to be done by the regular liners. The American-Hawaiian, Grace & Company, and Luckenbach Steamship Company all have vessels that will carry lumber, although they are all better adapted for general merchandise than for lumber, and in regular liners sailing promptly on time lumber cargoes are not as desirable on account of slower loading and discharging; but to develop the lumber trade to the best advantage steamers especially built for the lumber trade would be the most successful and would develop the trade better. At the present time there is no talk of any such vessels being built. That is the vessel situation from and between American ports.

"We now have to consider the situation from a British Columbia

point of view; that is, carrying lumber from there to New York. Any foreign steamer may engage in this trade, so it is free to the competition of the world, any number of suitable steamers being at all times available.

"The price of lumber in British Columbia has been higher than on the American side, but at present the price is about the same on each side of the line, so it comes down to the cost of transportation. The following is a comparison of two ships of the same size:

Dead Weight	British from B. C.	American from Puget Sound
First cost of an 8,000-ton D. W. steamer that would carry 4,000,000 (I doubt if the American vessel could be bought for this price to-day)	\$250,000	\$500,000
Cost of carrying a cargo of lumber from British Columbia or Puget Sound to New York, the total time loading, discharging and steaming, estimated duration, 60 days; distance, 6,000 miles; interest on investment, 6 per cent.; insurance, 6 per cent., and depreciation, 6 per cent., a total of 15 per cent.	7,083	14,166
White crew wages and stores of all kinds	8,640	10,040
1,050 tons of coal at \$5	5,250	5,250
Canal tolls (American measurement)	4,800
Tonnage dues, pilotage, etc.	600	520
Stevedoring 4,000,000 feet in and out	6,200	7,200
10 per cent. profit on investment for 60 days	4,166	8,333
Total cost of carrying 4,000,000 feet	\$ 36,739	\$ 45,509
Average cost per M feet	\$9.18	\$11.38

"Our Government has not told us on what measurement tolls will be paid. I have put in American measurement. I assume Congress will take off the duty; if not, that must be added to the British cost.

"If oil were used for fuel that would reduce the cost 50 cents a thousand, but in the above calculation no provision has been made to take the vessel back to the Pacific coast. I assume, however, it could get enough to pay its own way, and if an Asiatic crew were employed on the British ship the price would be further reduced.

"You will see that the first cost of an American steamer is the first serious handicap, and with the higher cost of American wages it runs up the cost so that competition is impossible. Needless to say, British Columbia will supply all the lumber it can cut for our eastern market.

The Varied Uses of Sawdust

Not so very long ago about the only real use anyone had for sawdust was for packing ice. That was when small local sawmills were more common, and the amount of this form of waste was, or

at any rate appeared, comparatively small. Now, when the tendency is to consolidate these into large mills with a capacity of several hundred thousand feet of lumber per day, the daily waste in sawdust

is seen to be enormous and much experimenting is being done to discover new methods of utilizing it.

Perhaps the most promising venture in sawdust utilization in this county is the manufacture of ethyl (or grain) alcohol. The sawdust is treated with sulphuric acid under suitable conditions, resulting in the formation of sugar, which is then fermented to produce alcohol. Several plants have been erected to produce alcohol from wood in this manner, and, though there are some difficulties still to be overcome, the ultimate success of the process on a commercial scale is assured.

Sawdust has been successfully manufactured into briquets for fuel for a considerable time in Europe by a very simple process. The shavings and sawdust are first steam-dried, the water contained in the wood being thus evaporated and the resin almost liquefied. The sawdust is then compressed under heat into briquets of the desired size, the contained resin acting as a binder. A firm in Vancouver is engaged in a similar line of manufacture, the sawdust being compressed into a cylindrical tube where it is cut into short lengths by a revolving knife, emerging in the form of small round briquets. These briquets are clean to handle, easy to kindle, and leave very little ash.

In England, sugar is manufactured on a commercial scale by treating sawdust in closed retorts with weak sulphurous acid under high pressure. In Austin, Texas, also a plant is being built to manufacture stock food from sawdust, by a somewhat similar process. The tar, pitch and turpentine are removed from the sawdust, leaving only sugar and fibre to which is added forty per cent. of cottonseed meal. The mixture is sold for fattening cattle.

Two and one-half parts of clear sawdust mixed with two parts sand and one part cement make a warm long-wearing and sound-proof floor, to which carpets can be tacked with less injury than to a board floor, and which has the advantage over a cement floor in being more elastic. These qualities should win an extensive use for this form of flooring, which has the additional advantage that it can be stained to harmonize with interior finishings by the addition of color to the mixture while in a semi-liquid state.

The sawdust of certain kinds of wood is used in considerable quantities by manufacturers of metal polish, for packing, for meat curing, for making safety explosives, and composition novelties, and for fibre and pulp manufacture. Patent cleaning powders for use on carpets and rugs consist principally of sawdust, lightly moistened by some cheap mineral oil.

Shingle Bolts Are Not Lumber

An interesting and important decision was recently rendered by Mr. Justice Clement in the Supreme Court of British Columbia in connection with the application of the Excelsior Lumber Company, of Crescent, B.C., for replevin against Hon. W. R. Ross, Minister of Lands, who ordered a consignment of shingle bolts which were about to be exported by the company confiscated.

It was contended by the lumber company that the shingle bolts were sawn lumber and consequently could be exported without violating the provisions of the Forest Act, which states that all timber cut upon certain areas shall be used in this province or be manufactured in this province into boards, deals, joists, laths, shingles or other sawn lumber except as hereinafter provided.

Mr. Justice Clement said, in part:

"It is not disputed that the blocks are intended for the manufacture of shingles; and it is quite clear, in my opinion that they are not a finished product in the sense that in their present form they can not be put to any practical permanent use. If left as they are they might aptly be styled 'lumber' in another sense, namely useless rubbish.

"In my opinion finished product in the sense I have roughly indicated, something available in its present shape to an ultimate consumer—is the genus within which falls each of the particular items which precede the general phrase 'or other sawn lumber,' and is the genus within which the legislature intended the general phrase should

be confined. I must confess that I would not myself call blocks of wood such as above described 'lumber,' but I do not put my judgment upon that ground because I am aware that the word 'lumber' is a word of most uncertain and indefinite meaning. But I am clearly of the opinion that this is a case which calls for the application of the just and generous rule. Lord Robertson speaks of the rule as perfectly sound, both in law and also as a matter of literary criticism. The recent cases emphasize this, that there must be a genus, a class, a category within what the particular words fall. Given such a category as I think the statute here indicates, the general phrase which follows must be read as limited to matters falling within such category."

The decision is of importance to the lumber interests of the province in defining the meaning of sawn lumber and it will have the effect of stopping further exportation of shingle bolts to be manufactured into shingles in the United States mills.

The Excelsior Lumber Company has entered an appeal against the judgment with the court of appeals.

The Department of Lands following his Lordship's decision, returned the six carloads of shingle bolts as an act of grace and also released a log boom which had been seized, the company giving a substantial bond that it will not break the law prohibiting the export of shingle bolts.

Report of Ontario Woods and Forests

The annual report of the Minister of Lands, Forests and Mines for the province of Ontario for the year ending October 31st, 1912, showed total revenue accrual from the woods and forests to the extent of \$2,068,060.38, which amount is \$83,197.78 less than for the year previous. The decrease occurred principally in receipts from bonus, which were \$96,968 less than in the previous year. The revenue collected on account of the above accrual and those of former years was \$1,985,662.78 or \$274,225.91 in excess of the revenue collected in the previous year. The principal increases were in timber dues, \$166,673.37 and in bonus \$113,884.14. The mileage under license during the year was 996 miles less than that of the previous year, as certain licensees had not paid up their grounding rent, or were indebted for dues, which prevented the issue of their licenses. 307 miles were also surrendered as having been cut out and were withdrawn from license.

The output of pine sawlogs, boom timber and square timber brought into feet board measure equalled 487,838,666 feet board measure, which is 96,425,439 feet below the output of 1911.

The output of timber other than pine showed an increase of 24,-

093,160 feet over the previous year. There was also an increase in the pulpwood of 49,612 cords. The most noticeable expansion was in railway ties. The quantity taken out in 1911 was 4,270,832 ties. During 1912 the quantity was 5,704,459 ties.

The area covered by timber licenses during the year was 18,410¾ square miles. The revenue accrual from woods and forests referred to above was made up chiefly of timber dues amounting to \$1,346,694; bonus, \$485,926; deposits on timber sales, \$111,550, and ground rent, \$95,969.

The output of pine sawlogs was 461,664,401 feet b.m. The output of sawlogs other than pine was 62,176,153 feet b.m. The output of boom and dimension timber was, pine, 20,788,377 feet b.m.; other, 6,946,695 feet b.m. The output of square pine timber was 448,824 cubic feet. Tamarac piling was produced to the extent of 112,256 lineal feet and 250,724 feet b.m. Other products of the forest were as follows:—cordwood hard, 44,051 cords, soft, 46,362 cords; tanbark, 5,920 cords; railway ties, 5,704,459 pieces; poles, 15,367 pieces; stave bolts, 2,093 cords; pulpwood, 140,338 cords.

Hemlock Manufacturers Discuss Trade

Competition of Yellow Pine and Spruce Responsible for Recent Quiet Conditions—Business Outlook Promising—Twenty Dollar Base Maintained

A meeting of Ontario hemlock manufacturers was held at the Queen's Hotel, Toronto, on September 17th at which there was a good attendance and the discussion of trade conditions was of much interest. Mr. W. W. Carter, of the Fesserton Lumber Company, Toronto, occupied the chair and the attendance included the following:—J. D. Shier, Bracebridge; Norman Hocken, Otter Lake; James Lauder, Toronto; W. R. King, Mickle Dymont & Son, Gravenhurst; J. L. McFarlane, Graves, Bigwood & Company, Toronto; Charles McGibbon, Penetanguishene; J. R. Summers, Graves, Bigwood & Company; A. J. Detweiler, Quincy Adams Lumber Company, Toronto; Wm. Hetherington, Wm. Laking Lumber Company, Toronto; E. A. McBride, Standard Chemical, Iron and Lumber Company, Longford Mills; Fred G. Hill, Freeman Lumber Company, Midland, and A. Robertson, Hocken Lumber Company.

The chairman, Mr. W. W. Carter, in opening the meeting stated that he had recently had a visit from a large manufacturer of yellow pine who stated that there was a possibility of their stopping manufacturing for a time, as they were now selling their stocks at less than the cost of production. This would account for the large amount of yellow pine that had recently been offering in Ontario markets at prices which made it a serious competitor of hemlock.

The chairman then called upon Mr. McGibbon who spoke briefly, referring particularly to the grading rules for hemlock which had been drawn up at a meeting of the manufacturers a year ago. He believed that these rules had been a great benefit to the trade. His own company had lived up to them very closely. He thought that hemlock lumber to-day was cheaper than in 1907, taking into consideration the increased cost of manufacturing. He could not see how any man could think he was making money by selling hemlock lumber to-day at less than \$20. It could not be replaced at a profit.

The heavy import of yellow pine into Canada came in for a share of Mr. McGibbon's attention. He believed that it would be a good thing to educate public opinion as much as possible with a view to encouraging the use of native woods. Hundreds of thousands of dollars was going out of this country for American woods which never came back to Canada. Manufacturers on the other side of the line were sending to wholesalers and retailers throughout this province lists of ten to twenty cars of lumber in transit which were being sold at prices that made it impossible for hemlock to compete. The matter ought to be drawn to the attention of the Canadian Lumbermen's Association at Ottawa with a view to having them do whatever they could to improve the situation.

The chairman, Mr. Carter, agreed with Mr. McGibbon and thought that efforts should be made to persuade the Dominion and Provincial governments not to specify yellow pine for their buildings.

Hemlock Market Holding Well

Mr. Hocken reviewed the trade situation briefly, saying that during 1913 trade in general had come somewhat to a stand-still. They had been selling on a market which was not advancing. The price of hemlock however, had been well maintained. It was remarkable in fact, how the price had kept up. Other woods had lowered somewhat in price, but hemlock was holding its own. He could see no reason why lower prices should be accepted. The yellow pine was indeed a serious competitor, but they had suffered from this competition when hemlock had only brought \$14 to \$15. If the price of hemlock were put back to \$14 or \$15 to-day, he believed that they would still have to compete with yellow pine.

The quantity of hemlock in the yards and at the mills was not in excess this year of the quantity in other years. In fact, all lumber in general was not in excess. The cause of their trade troubles this year was the tightness of money. They might expect such troubles from time to time, but he believed that they had already weathered the roughest of the present gale. He expected an improvement this fall and had no doubt that next spring would see them enjoying a fairly good market once more.

Referring to the cut of hemlock during the coming winter, Mr. Hocken thought that the tightness of money would have its effect upon the output. Extensive bush fires had occurred during the past summer, but it was remarkable how little damage they had really done. In his opinion the fires would not have a tendency to increase the cut this winter.

Hemlock Prices and Stocks

Speaking of prices, Mr. Hocken said that his company had been receiving \$21 this year without a break, until the last four weeks when they had sold at \$20. They had not much stock in their yard now, the total being only about 750,000 feet. He thought that \$20

for the No. 1 was the proper price to-day. Lowering the price would not sell the goods. Under present conditions no man would buy lumber unless he needed it and if he needed it he would pay the bill. Enquiries for special bills during the last two or three weeks had been very numerous. His company had had more orders than they could handle and they had obtained some remarkably fine prices. Hemlock manufacturers ought to be content to hold their stocks until their customers required them. At present, stocks were moving much better than three weeks ago. He thought that anyone who carried his stock into the winter would have no trouble whatever in moving it during the months of March and April.

Winter Outlook Satisfactory

Mr. J. D. Shier, Bracebridge, Ont., believed that there would not be much stock carried into the winter. A great many of the mills would be finished cutting about the end of September. His own mill would be finished then; the shortest season it had ever had. By the end of the year he expected that all their stocks would be cleaned up. He believed also that, as a rule, pine stocks were not heavy this fall. As to hemlock logs, his opinion was that they were not likely to advance in price this winter and that there would be no difficulty in getting logs at last year's prices.

Mr. W. R. King, of Mickle, Dymont & Son, reported that during the last three weeks he had noticed a marked increase in the volume of trade. He believed that the trade would take all the hemlock available at the different mills at the present time.

Mr. McGibbon referring again to the yellow pine matter stated that the Grand Trunk had used yellow pine ties at Penetanguishene which were of a very poor grade and would have been refused if they had been furnished in hemlock of a similar grade by Canadians.

Mr. A. Robertson, of the Hocken Lumber Company, drew particular attention to the importance of watching the grades of hemlock carefully. If they would throw a few boards that were doubtful into the No. 2, they would see a great difference in their sales of No. 1.

Mr. Carter, summing up the discussion up to this point, said that the general opinion was that \$20 was the right price for No. 1 at present. There was apparently no reason why the \$20 base should not be maintained. This should be for car loads and for specified sizes and lengths. All the large manufacturers were in the habit of sorting out their stocks. For all the best selling sizes they should be getting \$20, but if they had a large surplus of some of the poorer selling sizes it was reasonable that they should sell this stock for a little less. These prices he understood were for carloads to the retailer. In selling to the wholesaler or jobbers, they would of course be justified in giving a reduction of 50c or \$1 to furnish a profit. He agreed thoroughly with Mr. Robertson regarding grades. The situation to-day was rather critical. He had in his possession a list sent out by a southern manufacturer and addressed broadcast to Ontario firms. The prices which this list quoted for yellow pine could not be touched with hemlock. They must watch their grades very closely and their customers would recognize that they were getting a better article when they purchased No. 1 hemlock in place of southern pine. He instanced a case where a southern manufacturer had recently called upon him and offered him stocks at very low prices. When he asked this southerner how he could afford to sell the lumber at such prices, the reply was that these prices were less than the cost of manufacturing, but that they were getting better prices in their own country and preferred to do the price cutting in Canada. Under these conditions it was most important that they should make their grades of hemlock right.

Mr. Carter suggested that the meeting should form a committee to start a campaign in favor of the use of native woods. He did not see why they should not go after the railroads, the governments and the public with a view to impressing upon them all, the importance and advantage of using Canadian woods.

Referring to his company's stocks Mr. Carter said that he did not think they would have over 1,500,000 feet or 2,000,000 feet of hemlock to carry over this year.

Proper Grading of Much Importance

Mr. Hocken also spoke of the importance of watching the grades. They had been trying to introduce hemlock during the last few years. At the present, when there was a little trouble in all lines of industry, they should pay particular attention to their grades and not let them interfere with the prospects of introducing hemlock more widely. A few hundred feet of doubtful stock laid out of a carload would make a vast change in the grading of a car.

Mr. Carter was of the opinion that consumers were now accept-

ing a little lower grade than a few years ago. He drew attention to the importance of obtaining the friendship of the wholesalers and jobbers. These men were continually visiting the trade and if the hemlock manufacturers treated them properly, giving them a sufficient cut in price to make a fair profit, they would assist considerably in the introduction of hemlock and there was so much competition from the south that the wholesalers and jobbers could either help or injure the hemlock manufacturers by advising people as to the class of wood they should use.

A short discussion took place upon terms of sale, Mr. Hocken suggesting that it would be well to adopt terms of 2 per cent. 30 days, net 60 days and after that 10 per cent. When a man gave only 6 per cent. after 60 days, the seller was practically acting as his banker and hemlock manufacturers could not afford to do this.

Mr. McGibbon thought that a man who would agree to give 10 per cent. after 60 days was not a desirable customer. Mr. Hocken remarked that it was surprising how many firms were taking time this year, a statement in which Mr. McGibbon agreed with him.

Mr. Carter suggested that lumbermen should all get together and arrange terms of sale. All the other businesses were doing this. It would be better for the trade throughout the country if their time dating were shorter and more encouragement were given to the man who paid cash. Encouraging a man who paid cash, kept him in the sphere in which he properly belonged. The result would be that his business would grow steadily and surely. Giving a man long credit was an injury to him.

Mr. J. R. Summers, of Graves Bigwood & Company, Toronto, brought up the yellow pine matter again saying that he had not seen any places where yellow pine was being used and where hemlock could have been used. He had not seen it in a single house in Toronto. He would be more afraid of spruce from the east in the smaller sizes.

Mr. Carter remarked that this was one of the reasons why they should keep their grading up to a high standard. If the grades were dropped, prices would come down and spruce would get some of the business.

After more discussion along these lines the opinion was generally expressed that the better way to fight yellow pine would be to say little about it, but to do everything in their power to educate consumers in Canada so that they would prefer native woods. The meeting then adjourned.

Plenty of Hemlock Logs in Sight

J. D. Shier Expects a Fair Supply for Manufacturers—Trade Conditions Give Promising Indications

Mr. J. D. Shier, Bracebridge, Ont., was one of the visitors to Toronto recently during the meeting of Hemlock Manufacturers. Discussing trade conditions with the Canada Lumberman, Mr. Shier expressed the opinion that during the coming winter there will be plenty of hemlock logs for manufacturers. His own firm will go into the woods to about the usual extent. He believes that before the end of the year, all hemlock stocks will practically be cleaned up. Under these conditions he looks for a good trade in hemlock next spring and summer.

Speaking of operating costs Mr. Shier said that they will probably be a little less this winter than last winter. The supply of men for the woods promises to be more plentiful than usual and wages are likely to be a little lower. Indications of these conditions are already noticeable in Ontario. Ottawa Valley firms report that they are obtaining a better supply of woodsmen this fall than for some years past. Horses, he believes, will unquestionably be cheaper. He had been making enquiries while in the city and found that there were a large number of contractor's teams at present idle. From information which he had secured personally he believed that he would be able to purchase for \$400 this year, teams which last year would have cost him \$500 and \$600. Hay and oats would probably be more expensive this year than last, on account of the alterations in the United States tariff which would enlarge the market for these products. Mr. Shier was not as yet in a position to refer definitely to the cost of provisions.

Speaking of the trade situation in general; and with particular reference to the financial outlook Mr. Shier was inclined to the opinion that trade would pick up this fall, so soon as money became noticeably easier. There were already indications of easier money and he thought, on this account, that the outlook was good. His own company and others of which he had heard were already receiving orders and enquiries of an encouraging nature. In spite of these indications Mr. Shier was not inclined to do any prophesying, realizing that the situation was controlled to a large extent by the bankers. He believed however, that there was good reason to expect during the present fall and winter, at least a fair trade, and during the coming spring a return to the prosperous conditions which were general about a year ago.

Ontario Lumber Salesmen

Men Who Keep the Stocks Moving

Alex P. Read, Toronto

A. P. Read, Toronto

One of the younger men who has rapidly made a name for himself as a lumber salesman in Ontario is Mr. Alexander P. Read, of Read Bros., Limited, 43 Victoria Street, Toronto. Mr. Read was born in 1885 on a farm near Richmond Hill, Ont., and received his early education at Richmond Hill high school. After leaving this school in 1901, Mr. Read entered the employ of the Eyer Lumber Company, Limited, by whom he was engaged in their office and in the Northern Yard in the city of Toronto for three years. He then went out to the lumber camps and sawmill of this company at Wilberforce for two years and obtained a thorough training in bush work including an education in the use of the cant hook, the wearing of cork shoes on the river, and in the manufacturing of

lumber from the tree to the car. When he had proved himself capable at this work during a period of two years, Mr. Eyer brought the subject of our sketch back to Toronto where he was placed in charge of the office of The Eyer Lumber Company, Limited, and also travelled for them until the end of 1910. Having by this time acquired a good general knowledge of the lumber business Mr. Read on the first of January, 1911, went into partnership with his brother Mr. Alfred E. Read, under the style of Read Bros. So successful were these two brothers in building up a substantial business that, finding themselves in need of further capital to take care of their increasing volume of trade, on January 1st, 1913, they formed themselves into a limited liability company with the title of Read Bros., Limited. Mr. A. P. Read is the president and a director of the company. Mr. Read does considerable of the purchasing of lumber for his company, and sells mostly in Toronto and Eastern Ontario.

Until two or three years ago, Mr. Read was a very well known paddler and has carried off a number of prizes for this sport. In the years 1909 and 1910 he won several Canadian and United States championships, among them being the long distance tandem for the United States. He was also a member of the Canadian championship war canoe; and of the Toronto Canoe Club Four, which won the junior, intermediate and senior Canadian championships in 1909 and 1910.

Since Read Bros., Limited, were incorporated their business has been steadily increasing and this year will undoubtedly show the best results since the brothers commenced business together. The company carries a full assortment of spruce, hemlock, white and red pine.

Railways Continue Cartage Arrangement Temporarily

The Canadian railway companies have just notified the Canadian Manufacturers' Association that they are prepared to continue their cartage service until January 1st, on the basis of 3c. per 100 lbs. tonnage freight and 20c. for smalls, the present rates being 2½c. and 15c. respectively. Negotiations are still going on with a view of having the service continued permanently. The Canadian Manufacturers' Association is securing the views of its members as to the wisdom of entering into this temporary arrangement to relieve the situation. The Dominion Board of Railway Commissioners recently announced, in response to the urgent request of shippers represented by boards of trade, lumber and manufacturers' associations, that it would require the Canadian railways to show cause for their proposed abolition of the cartage system. The Commission changed its mind however, and decided not to take up the case, which had been set down for September 16 at Ottawa. It would have been necessary therefore, after October 1 to make separate arrangements for cartage, a condition of things which would mean greater cost of delivery unless shippers got together to form a joint cartage organization.

Mr. James Ross, C.E., the railway contractor and capitalist, who died in Montreal on September 20th was extensively interested in lumber and pulp propositions in Canada. In 1889 he promoted the Columbia River Lumber Company and he was a director of the Laurantide Company, the pulp and paper undertaking of Grand Mere, P.Q.

Waste Reduction—The Problem of Today

No Industry But Lumber Manufacturing Now Permits Such Loss of Raw Material—The Situation and Its Solution

By Charles Allen

IN writing on the topic "Waste reduction and waste utilization" I trust that no one who should happen to read my articles, will think for one moment that I am actuated by a "know it all" spirit. I am simply trying to discuss the subject as I see it, and think I know it.

What I understand by waste in the manufacturing of lumber, is made up of wood left in forest in the form of logs not taken from tops, skids, small logs down to 4 in. on top felled in cutting roads, small trees left standing in such exposure that they will be almost sure to be blown down, and the losses incurred by bad judgment in cutting up the trees, once they are felled.

As these wastes above noted are as much as can be commented upon in one article, I propose to discuss the possibilities of the small logs and the waste at the mill, at a later time.

Before proceeding further I will say what is in my mind touching timber resources, and what the future possibilities look like to me, in the light of fifteen years of hard study.

When we cut down the virgin timber stand we have taken the cream. No matter how carefully we cull, nor how much we may plant, we will never again see in this land, such perfect specimens of our noble trees as we have taken. It is too true, they never come back. The second cutting is never equal to the first, nor will the third cutting compare with the second. We have changed the conditions in making the first cutting. What nature has worked to produce in her slow and perfect way for probably hundreds of years, has been taken, and she demands just the same time to do the work over again. She never hurries. I know that some of our forestry friends will disagree with me right now, but careful examination of timber limits that have felt the weight of the axe, convinces me that, sad as the fact is, it is a fact, that once cut our "beauties" never come again.

The Problem in a Nutshell

The cause of the present great waste is present methods. The cause of present methods is faulty organization. The cause of this faulty organization of working forces is the cry for dividends, and the cause of difficulty in securing these dividends is, to a large extent, traceable to a false idea as to the proper method of securing the said dividends, and there you are right back to the starting point.

The standard should be, how much profit per stump can be made, what percentage of saving per stump can we attain; not how many thousand feet can we drag out from our now all too scanty source of supply, irrespective of how much we leave behind to rot on the ground or pile up the waste fire at the mill.

Now to get at the organization:—the general-manager has no time for waste problems. He has fixed charges staring him in the face, and must scare up dividends somehow, or the big basket will get his head. The woods-manager is in the same position. He must get his logs to the mill at a price or move on. Camp or shanty foreman must get results on the basis of so many thousands of feet of logs per man and horse employed or, else he is no good.

Everyone has more to do than he knows how to get through with. Who looks after the waste problem? No one. What is the solution of the problem? Simply this. WASTE PREVENTION AND WASTE UTILIZATION IS A PART OF THE LUMBER BUSINESS. IT IS A DEPARTMENT, AND SHOULD BE IN CHARGE OF A SPECIALLY TRAINED MAN, WHOSE DUTY IT IS TO GET SOMETHING OUT OF IT, AND TO MAKE THAT SOMETHING PAY. Let us see how this idea lines up.

A lumbering concern is formed, and purchases its raw material (standing timber) solely on the report of expert examiners of timber stands. They then call in architects, mechanical engineers, civil engineers, hydraulic engineers, men competent to grapple with the problems confronting them, and to locate the mills, dams and railroads. Then come the forest engineers, who locate and block out the timber, lay out the roads, and prepare topographic maps, and decide on the best and cheapest method of moving the timber. This concern then proceeds to operate, and while it is just as important that the waste problem should be handled by an expert in that line, as it was that all the problems of location and construction should have been so handled by experts, they pay no attention to this matter but go ahead hit or miss. What is the result?

A very careful manufacturer of hardwood has recently stated

A special department of waste prevention in charge of a specially trained man, whose duty is to make his department a profitable one.

publicly, that but fifteen per cent. of the weight of standing hardwood reaches the market in the form of saleable lumber, and another good authority claims that less than thirty per cent. of the bulk weight of standing spruce, pine, and hemlock, is sold in the markets in like form.

Surely it needs no argument from me, to convince any thinking man, that somewhere in this loss of eighty-five or seventy per cent., as the case may be, the waste expert has room to squeeze in, and not be very tightly squeezed either.

Results Secured in Other Industries

A condition right in line with present losses in the lumber business, existed not many years ago in the large packing-houses in Chicago, Omaha, Toronto, and other points. A comparatively small output of saleable products was obtained per carcass. To-day practically every pound of the carcass is turned into a paying product. The older management did not see how a certain percentage of waste could be avoided. Little by little they cut it down until now the saving is close to one hundred per cent.

I feel sure that we will never be able to save any such percentage of the raw material as the packing house does, but that we will cut down present losses to a large extent seems very clear to me.

The lumber industry must go through just the same process as the packing house business did. Little by little we will cut down the percentage of waste, until we have exhausted all the practical uses for the waste.

Let no one be misled. We will not accomplish at a jump, but slowly the evolution will progress, until some day in the not too distant future we will be close to the goal of our desires. This has been the history of all highly developed industries. Oil, metals, packing houses, power production, chemical production and so on through a long line of brilliant accomplishments in the world of production. These results were obtained by organization, research, and expert handling of every department. They were never obtained by the methods in vogue in the handling of our timber resources, and they never can be.

This waste problem is individual. That is—every single operation has its own special problem which must be worked out on the spot. He would be a bold man indeed, who would lay down any fixed rules for handling all operations, and no one knows this better than he who has made it a study. Location, transportation, labor, markets, variety of timber cut, all enter into the problem and then some other things. What I do claim is this—NO CONCERN HAS A PROBLEM IN THE WASTE LINE, THAT IS IMPOSSIBLE OF SOLUTION TO A GREATER OR LESS EXTENT.

In going into the woods to save waste, two lines of procedure are open to the man who undertakes to do the saving. One is to treat the trees felled as a straight logging proposition up to 4 in. or 5 in. on the top, and the other is to let the greater crew proceed as they have been doing and follow the slashings with special men, to rescue the small top logs, and general run of small logs, in the wake of the fellers and road cutters. Local conditions must govern his choice of procedure.

If the first line is chosen he must have expert men to cut up the trees when felled. The usual practice now is to let the fellers cut the tree into logs. This is a big mistake. The orders are to cut logs 12 ft., 14 ft., 16 ft., and so on long, and every tree gets its dose of 12 ft., 14 ft., 16 ft. with no distinction, and often with little exactness as to length. The case is comparable to employing a doctor who uses but one remedy, no matter what the trouble is; scarlet fever and broken legs cured by a dose from the same bottle. Until we learn to cut our logs in the woods, so that the full value in lumber is obtained at the mills, we are standing a loss that no one can estimate, but from what I have seen it would frighten the man who had put his money against a stand of timber.

This first method might seem at first glance to increase the cost of logging, but it should not do so. You will get an increased output per stump and a large percentage of real No. 1 lumber at the mill. You will also avoid handling a lot of waste at the mill from improperly cut logs, and it will save the mill superintendent a lot of tearing at his hair because a part of his supposed 12-foot logs have to be trimmed back to 10-foot stock, and a part of his 14-foot stock is in reality 15 feet long, and the waste is a sight to see. These are every-

day happenings in all mills when the logs made by the fellers are being cut up.

If the conditions seem to warrant our wood saver in letting the logging go on just as it is, he will use a small special crew to follow up. This kind of logging is not costly. The trees are already felled the roads are cut and usually enough room is found on the skidways for the saved tops. It costs little if any more to haul them to the river landing or rail loading point, and no more per thousand to drive or railroad them to the mill than the regular stock. If there is a slight cost over the regular stock for hauling and moving to the mill, just remember they cost but little on the skids in the woods, as having been saved from what was always waste they stand no cost but their actual lopping, cutting, off, and hauling to the skids. Stumpage, road cutting, camp building, portage expense, are never charged against this class of logs. They are waste pure and simple, or at least always have been until now.

No matter which line your man follows he will have his men pick up the small stuff (now wasted) from road cutting and skidway cutting, and he will also see to it that skids that are of use go forward to the mill. In most cases he will find that he will have something to contend with, unless he has behind him a real up-to-date woods manager. If his camp foremen are of the old school, they will despise his saving from the waste pile, and look on him as a sort of intruder in their domain, but men who have paid for the stumpage cannot stop at sentiment, if there is any money to be made in doing this kind of saving.

Stumpage Dues an Important Factor

A point that would have to be settled in some of our provinces is this. What will the stumpage dues be on this class of stock? If the government enforces its full stumpage rates, I fear that this saving cannot be made, unless, the timber is very favorably located, but I think in almost every case permission can be had to take out this class of stock without dues of any importance being charged against it, in view of the fact, that, the full dues are being paid against each stump in the scaling of the regular stock.

I understand that the Province of Quebec is now insisting that everything down to 6 in. top must be taken from spruce cut on Crown lands. This move seems wise to me, but I think it is causing a lot of fault-finding on the part of the operators. If they would simply handle the small logs as a side department in charge of a man familiar with this class of stock, and go on with the sizes they are used to handling in the same way as they always did, they would find things to their liking and as good a balance to the credit of manufacturing account in the ledger. These small logs call for special treatment at the mills, and if they try to apply the same methods to the handling of 6 in. tops, as they do to 12 in. tops, they will surely find that they will run the cost of their whole output up some points.

The objection is urged that these small-top logs are knotty. True to some extent, but very many of the small logs would be quite free from knots, and in very few cases would they be so knotty as to do them any harm for the uses to which they can be put.

No one, not even the operators themselves, have the least idea how a stock of top logs would look, unless they had made a special study of the matter, and I feel warranted in saying that most woods managers would not believe, that so much valuable wood could possibly be recovered from their slashings.

In the case of hardwoods, which are now seldom cut to less than ten-inch top, it is my opinion that they can be safely cut to seven inches on the top and made to pay all right at that size.

No doubt many mill men will think this kind of talk is like a dream. They have never tried to do anything along these lines, hence it cannot be done. To all such I can but say—No one can prove his ability or inability to swim until he has entered the water, and no one who has not made this waste department a factor in his lumber business has any idea what he can do with it. He has not entered the water yet.

To sum up on this waste in the woods:—I believe we will all admit that it exists, and that stumpage costs something, hence the waste costs money. If we make no move to save it, it will always remain just what it now is, an item of loss. If it is ever to be saved someone must be detailed to save it, and no one who has something else to take up his time will accomplish the saving. Compared with some problems that have been mastered by the lumbermen this one is not so very large, and I am sure that the brains and business ability that have put the Canadian lumber business in its present high position will handle this waste problem and master it, as they have done with all other problems.

Premier Flemming stated that of 10,400 square miles of timber lands controlled by the government of New Brunswick, all but 700 or 800 square miles have been, or will be, taken up immediately by operators under the new timber lands act adopted last winter. The timber wealth of the province is still its greatest asset and its greatest source of revenue.

Hoo-Hoo Annual Held at St. Louis

Reports Presented Show Encouraging Increase in Membership and Improved Financial Condition

The twenty-second annual meeting of the Concatenated Order or Hoo-Hoo was held in St. Louis, Mo., on September 9th and 10th. The most interesting event of the meeting from a Canadian point of view was the fact that Winnipeg, Man., was unanimously chosen as the place of the next annual meeting.

The official reports showed that the Supreme Nine and the Vicegerents had done a good year's work. An addition of 941 new members was shown and a loss of 152 by death and 128 by resignation.

The annual address of Snark, Frank W. Trower included a number of recommendations, among them one for an increase in dues.

The Scrivenoter's report showed total receipts for the year of \$23,334.80, including a cash balance of \$649.59 at the beginning of the year. Disbursements were \$26,690.57. A total deficit was shown of \$7,634.70, as against a deficit of \$8,451.29 at the beginning of the year. An improvement is thus shown of \$816.59. These figures take no account of dues amounting to \$11,127.60 outstanding for 1912-1913, of which a considerable part will be paid. Sixty-nine concatenations were held during the year at which there were 941 regular and one honorary initiates.

An innovation in the report was a set of comparative tables. Itemized receipts and disbursements were given by years from 1901 to date. Membership analysis was given for each successive 1,000 accessions from the beginning, showing how many in each 1,000 have died, resigned or been suspended, and how many remain on the lists, and of these how many are fully paid up or are delinquent for one year or for two. Of the first 1,000 (1891-93) 265 remain, 19 of them delinquent one year and 29 two years. Of the 10,000 series (1903) 315 remain, but 44 are delinquent one year and 58 two years. Of the 20,000 series (1907-8) 452 remain, of whom 53 owe for 1913 and 163 for both that and the previous year. Of the total of 28,005 members 12,588 remain on the rolls, but 1,882 owe dues for 1913 and 2,431 for 1912-13, leaving 8,275 fully paid. Losses have been 1,055 by resignation, 53 by expulsion, 12,918 by suspension, and 1,391 by death.

Another table showed the accessions by years: over 1,000 for each year from 1902 to 1913; over 2,000 for the years 1905-7, and largest in 1907, with an accession of 2,460 in the regular list.

The accessions in Canada during the last four years were as follows:—1910, 87; 1911, 149; 1912, 36; 1913, 168. The Scrivenoter recommended that the dues be increased to \$2, but not before September 9th, 1914. He recommended also that the cost of reinstatement be changed from \$5 to \$3.30. The report showed that the Scrivenoter had secured positions during the year for over thirty members.

The annual concatenation was held on the evening of September 9th and eight members of the Supreme Nine were in attendance. Twenty-six kittens, chiefly from St. Louis, were received.

Interesting and valuable addresses were delivered during the meeting by several prominent members. One address, prepared by Mr. Leonard Bronson, Chicago, was read by Mr. Albert Cone and was devoted to a suggestion that the work of the Hoo-Hoo at its annual meeting could be made more valuable if the annual meeting were composed of a delegate body. The balance of the paper presented suggestions for carrying out this proposal.

The committee on the constitution endorsed Mr. Bronson's suggestion, but expressed a belief that the order had not yet reached the proper stage of development for its adoption.

On September 10th the committee on the good of the Order recommended that Hoo-Hoo take the initiative in organizing "The American Timber Trades Association" and in securing the co-operation of all lumber organizations for this purpose. This proposal was unanimously approved.

Mr. George H. Grayson offered 100 acres of rich improved Arkansas cotton land, with good buildings and \$5,000 cash, as a nucleus for an old lumbermen's home in Arkansas. For this he received a hearty vote of thanks. Other recommendations included an increase of the Scrivenoter's salary from \$3,200 to \$3,666.66; a rigid separation of the frivolous and the serious parts of the ritual, and a further shortening of the present ritual. The election of officers resulted as follows:—

Snark of the Universe—John Henry Kirby, Houston, Tex.
Senior Hoo-Hoo—E. D. Tennant, Winnipeg, Man.
Junior Hoo-Hoo—J. H. Ehrmanntraut, Seattle, Wash.
Bojum—Charles B. Brace, San Francisco, Cal.
Scrivenoter—W. M. Stephenson, St. Louis, Mo.
Jabberwock—Thomas H. Calhoun, Meach, Ga.
Custocatian—P. T. Langan, Cairo, Ill.
Arcanoper—W. J. Woodward, Norfolk, Pa.
Gurdon—E. H. Lewis, New York City.

A resolution was adopted favoring San Francisco as the location for the 1915 annual.

Planing Mill Company's Rapid Growth

Webb Lumber Company of Toronto—An Important Factor After One Year's Business—An Interesting Motor Driven Plant

Webb Lumber Co., Toronto—Individual motor drive on 15 in. matcher.

Webb Lumber Co., Toronto—Feeding-in end of 15 in. matcher.

An interesting instance of business progress based upon experience and energy is afforded by the Webb Lumber Company of Toronto which took over the planing mill business of the Gold Medal Furniture Company on July 1st, 1912. Mr. R. H. Webb had been one of the most valued employees of the Gold Medal Furniture Company, having been in charge of the planing mill end of their work. In this work he had the advantage of being associated with a company which had been in business for over 25 years and had become one of the leading companies in the furniture manufacturing industry. Mr. Webb started work with this company, remaining with them long enough to obtain an excellent grounding in the various departments of planing mill work. Wishing for a wider experience he left the company after a few years and went to the west, where he obtained employment in Idaho, U. S. A., and added greatly to his experience.

Returning to Toronto he took charge of the planing mill end of the Gold Medal Furniture Company's business and continued in charge until they gave up this part of their business. Mr. Webb then took it over, and has developed the business with much success, his energetic methods being largely responsible for his success.

Mr. Webb is quick to realise the presence of an opportunity and to understand the best methods for taking advantage of it. The opportunity for purchasing the planing mill business of the Gold Medal Furniture Company, was apparently the one for which he had been preparing himself throughout his earlier years of business. To-day after a little over a year's experience as the head of this business, he finds himself in charge of an industry which is growing almost too rapidly to be handled successfully. Mr. Webb, however, is one of those men who enjoys such a situation and is certain to come out of it with flying colours.

The plant of the Webb Lumber Company is notable particularly on account of the fact that every machine is run by an individual Westinghouse Electric Motor. The equipment includes two Cowan 12 in. stickers, one Ballantyne 12 in. sticker, one McGregor and Gourlay 15 in. matcher, 1 Ballantyne cut-off saw and 1 each Ballantyne and Cowan rip saws. The product of the plant consists entirely of interior finish. The company do not handle hemlock or rough lumber of any kind, but specialize in all kinds of hard woods. An interesting example of their work is afforded by the the private office of Mr. R. H. Webb, which is finished in a variety of woods, including birch, ash, gum, fir and oak. Almost every known wood which is used for interior work, from mahogany to Norway pine can be found in the company's stocks. The output of the plant during its first year amounted to about 4,000,000 feet, chiefly hard woods. Their raw materials are secured from several mills, of which they purchase the whole output. Some of their stocks are also obtained from wholesale lumber dealers. The company carry on business in Toronto and throughout the province of Ontario in general. They handle all kinds of doors and sash, manufactured chiefly of hardwood pine and fir. One of the chief aims of the company is to specialize in native Canadian woods. In connection with their business the company operate a dry kiln, manufactured by the Standard Dry Kiln Company of Detroit which has a capacity of 250,000 feet.

During his time in the West, Mr. Webb was connected with the Blackwell Company in the Inland Empire. Two of the mills of this company each cut 500,000 and one 750,000 feet of lumber per day. Mr. Webb worked, at various times, in every department, in the woods, saw mills, office and on the road. Every machine in two of this company's plant was run by individual motors and it was there that Mr. Webb was impressed with the benefit of this system, which he subsequently installed in his own plant.

A Pioneer Lumberman's Death

The death of Wm. Gillies, of the firm of Gillies Bros. Limited, Braeside, Ont., occurred on September 10th at the home of his sister, Mrs. Jas. F. McEvoy, 36 McArthur avenue, Toronto. Mr. Gillies, who was 72 years of age, passed away peacefully during his sleep, the immediate cause of death being heart failure. For some years Mr. Gillies had been leading a retired life and living with his sister

Webb Lumber Co., Toronto—View of two 12 in. stickers.

in Toronto. Lately he had suffered from heart trouble, but had not been seriously invalidated from it.

The late Wm. Gillies was one of the four sons of the late John Gillies, one of the best known men in the lumbering industry of Ontario of over a generation ago. The business of Gillies Bros. was established in 1873 as a partnership of Jas., Wm., John and David Gillies, the four sons of the late John Gillies, of Gillies Mills (now Herons Mills) and Carleton Place, Ont. The late John Gillies was senior partner from 1867 to 1873 in the firm of Gillies and McLaren, large manufacturers of sawn lumber at Carleton Place, and for a score of years previous to that date was actively and extensively engaged in the square timber trade on the Clyde, Mississippi and Trent rivers. The business was moved to Braeside, in order to locate on the Ottawa River, with a view to further expansion. The partnership formed in 1873 was changed in 1893 into a limited company under the name of Gillies Bros. Limited, with the four original partners and the oldest sons of two of them as directors. Later, other sons were admitted. The original partners continued together without a break for thirty-six years until the death, in January, 1909, of Jas. Gillies, the senior member of the partnership and the president of the succeeding company from its incorporation until his death. Thus there is shown a continued active connection with the timber trade, extending over sixty years and three generations. The removal of the late Wm. Gillies makes another break in the connection with the early days.

The St. John River Log Driving Company's rafting operations closed on September 3rd for the season. The amount of lumber rafted this year is said to have been fifty-three million superficial feet, which is expected to be the smallest season's work in the history of the river.

Webb Lumber Co., Toronto—View of part of the yards.

Practical Hints for Shingle Makers

Editor Canada Lumberman:—I have been in the shingle manufacturing business a great many years and the experience I have gained enables me to avoid many difficulties which continually confront manufacturers. My difficulties today are really very few and I would like to explain the reason to others so as to be of some help. The greatest difficulty which shingle manufacturers have to deal with today is the labor problem. It is impossible to get good employees for a shingle mill and we have not been able to develop good men from the material which we have to work with.

I find that the only tooth with which one can obtain good results in a circular cut-off saw is one with a deep bevel. This enables us to get our shingles smooth and it is also the fastest saw for cutting the blocks. It saves labor and it is much superior to the drag saw, providing that your timber is not over 36 inches in diameter.

In hiling a shingle saw, a straight back tooth with a one-third book and a square face will give the best cutting results and will last the longest. One shingle saw filed in this manner can be run from 5 to 6 hours and will cut from 10,000 to 13,000 shingles. This you will see is a pretty good result because, as a rule, shingle saws only cut from 4,000 to 5,000 pieces.

A most important matter is the installation of the belt in a shingle mill. It is a great mistake to put in a short belt. The longer the drive the better the results. With a long belt the under draw is more effective.

In operating shingle mills during the winter much difficulty is found in connection with the conveyors which take the refuse from the mill. It is better to have two rollers on the conveyor instead of sprockets because the sawdust freezes on the sprockets or rollers, but with the latter one may put in a stripper underneath the front roller. When the roller revolves, the stripper cleans away the sawdust and prevents the chain from tightening and stopping the conveyor. Another useful bit of equipment is a splitting saw, which will save a great deal of time.

I hope these ideas may be useful to some of your readers.

Yours very truly,

W. A. Lavoie, Peterboro, Ont.

U. S. Census Report on Lumber Production

The United States Census report upon the lumber industry for the year 1912 shows that the number of mills reporting and the cut for that year and the preceding years were as follows:—

Year	Mills Reporting	No. of Feet Board Measure
1910	31,934	40,018,282,000
1911	28,107	37,003,207,000
1912	29,648	39,158,414,000

This report does not include any mill cutting less than 50,000 feet board measure daily. This is a feature of the report which creates much criticism among lumber manufacturers, because the aggregate production of the mills which are not included is enormous and would have an important bearing upon the statistics, if their output was included. The average yield per mill was 5.30 per cent. greater in 1912 than in 1910 and 6 per cent. greater than in 1911.

The increased production of the Southern States was substantially greater than from the whole of the United States. In 1900 the Southern States produced 38.7 per cent. of the total production of lumber in the United States, in 1907 45.7 per cent. and in 1912 51.4 per cent.—just 1.4 more than one-half of the total. The cut of the state of Washington in 1912 was the largest reported since 1906.

The yellow pine production in 1912 was 14,470,617,000 feet, board measure, and the cut of Douglas fir was 5,175,123,000 feet, board measure.

In the soft wood white pine stood third, although the report fails to give the board measure feet of the cut.

The cut of hardwood lumber was 8,631,998,000 feet, board measure, in 1912, 8,100,819,000 feet in 1911, and 8,857,426,000 feet in 1910; oak showed an increase over the output of the preceding year of 220,508,000, alone contributed to the cut 3,318,952,000 feet or 38.4 per cent. Ranking next to oak came maple, red gum, tulip poplar, chestnut, beech and birch.

Shingles and lath did not differ materially in 1912 from the quantities produced in 1910.

The production of the lumber in the first ten states of the list of states, ranks as follows: Washington, Louisiana, Mississippi, North Carolina, Oregon, Texas, Arkansas, Virginia, Wisconsin and Michigan.

Dr. B. E. Fernow, Prof. of Forestry at the University of Toronto, in a recent interview stated that Canada has about one-fourth the quantity of timber that the United States has.

Modern Camp Building Construction

Taking Care of Comforts of Employees Brings Results as Surely as Money Spent on the Latest Machinery

By J. J. Donovan*

The Bunk House—Bloedel Donovan Lumber Mills.

EACH camp and timber tract is a problem for the owners which may be solved in various ways. It is not always clear which plan is best, but cheap and unsanitary camps may not mean eventual low cost per thousand of timber handled.

The big, dark, crowded bunk house has gone by, even for temporary camps and in its place we have small units, portable, or on wheels where the men have more privacy, more comfort and may form more congenial groups. Where the large temporary bunk houses are still built they are greatly improved over those of past years. The logger at most camps has little ground for complaint as to food, shelter or pay now that the donkeys, locomotives and "flying-machines" have replaced the bull and horse teams of twenty years ago.

Difficulty in obtaining building material and the necessity for placing camps within walking distance of the work accounts for the character of many of the temporary camps which have furnished texts for sensational complaints written for cash by gentlemen more accustomed to the luxury of city hotels than the rough life of the woods.

Origin of The Camp Buildings

The camp of our company at Alger, in Skagit County, is the result of a combination of circumstances which warranted somewhat better construction than is usual. After fourteen years of operations, involving the building of seven temporary camps of varying types, we had cut all outlying timber. Our holdings, aggregating one billion feet, were all within six miles and half within three miles of Alger, where our logging railway crosses the Great Northern branch which we operate under lease.

With a dismantled mill, old store and office as a nucleus, we built, early in 1912, a new bunk-house which accommodates one hundred men, repaired and renovated quarters for fifty more, transformed the old mill into a dining-room seating one hundred and fifty, with suitable kitchen and store-rooms and recreation room upstairs, built a

Employees' Cottages—Bloedel Donovan Lumber Mills.

machine shop eighty by one hundred, of common boards on heavy frame, oil station, water tank, sand house and a number of small auxiliary buildings.

All are lighted by electricity, the bunk-house and dining-room heated by steam and supplied with hot water from the machine shop three hundred feet away where we make all necessary repairs on our fifteen donkey engines, four locomotives and sixty cars. Our railroad yard is arranged with Y, passing and spur tracks at this point, so that supplies may be delivered and trains made up with the minimum of labor.

We expect Alger to be our supply and repair headquarters indefinitely and for two or three logging sides, as long as we can reach the working front in the woods within fifteen minutes by rail. This means approximately a four-mile radius. After that distance is passed light, outlying camps will be used. Because of the permanence of the repair part of the camp our machine shop was made eighty feet wide and one hundred feet long, of strong simple construction with double tracks and pits in the centre.

One side is used entirely for the storage of wooden car-sills and repair parts and for woodworking.

The other side is the machine shop proper. An oil-burning, fifty-four-inch by sixteen-foot, boiler furnishes light, heat and power for the shop and camp. It uses from sixteen to twenty-four gallons of fuel oil per hour, depending on the work.

A seven by twelve Atlas engine drives the shafting and a General Electric 20 kw. dynamo.

Complete Shop Equipment

In the shop are two forges, a No. 5 Beaudry power hammer which, with one blacksmith and helper, do all the work for the railroad and three sides, a twelve-foot New Haven lathe, twenty-six-inch swing, a shaper, a twenty-six-inch Barnes drill, a Williams No. 1 pipe and bolt cutter, a seventy-five ton hydraulic press, power grinders and saws

Dining and Recreation Rooms—Bloedel Donovan Lumber Mills.

* Address delivered at Pacific Logging Congress, Spokane, Washington, September 24th.

enable a small force to keep our equipment in repair at a minimum cost.

The dining-room and recreation-room overhead are capable of caring for one hundred and fifty men. The recreation room has books, papers, card tables, two pool tables, a barber's chair, bathrooms and lavatory. This is open to all, but for use of baths and pool tables a small charge is made by our lessee. He sells soft drinks, cigars and tobacco. No gambling, nor sale of beer or liquor is permitted.

A Fine Bunk House

Our bunk house has created more discussion than any feature of the camp and is perhaps worthy of some description. It was designed to be cleanly, comfortable and sanitary. It is heated with steam, is electric lighted, and has hot and cold water, where fourteen men may wash at one time, in the lavatory at the rear, where are also modern toilets draining to a septic tank five hundred feet away.

There are eight rooms accommodating eight men each, two of four, and the upper floor where there are accommodations for thirty. The eight-men rooms are fifteen by twenty-six with a light partition crossing midway, but with three and a half foot centre opening. This gives each man a corner of his own with shelf and locker.

Two large windows hung on pulleys insure ventilation. There is a small table and electric light for each four men.

Steel "Tiger" bunks three and a half by six and a half feet are provided for each man, also a plain mattress. The men still carry their blankets and having provided these quarters, each man looks after his own belongings. The company sees that every room is swept daily. The hard-finish plaster and steel bunks have reduced to a minimum the danger from vermin, which often infest otherwise good sleeping-quarters.

Twelve by thirty-six-foot porches in front of both first and second storeys are much used by the men in good weather.

A good water supply was obtained by laying a wooden pipe line, partly five and partly four-inch, up Silver Creek, one mile, at a cost of fifteen hundred dollars.

The bunk house cost four thousand dollars, the steel bunks six hundred and seventy-five dollars and the total cost of the camp, old buildings renovated, new ones constructed, water and electric supply, bunks and other furniture was \$15,427.05. This does not include any track work, nor the machinery at the shop.

Encouraging Families to Come In

Having arranged for economical repairs of our equipment and the decent shelter and feeding of our men who live in camp, we undertook to make some provision for families.

Alger is fourteen miles south of Bellingham on the main road between that city and Seattle. This road passes about one thousand feet east of camp and has had a good school-house and some families for a number of years.

We removed the stumps and cleared up ten acres along the road, and offered lots fifty by one hundred and thirty at practically cost to any who desired homes of their own. We also offered acre lots, uncleared, abutting on the road and logged-off lands near by in tracts to suit, all on long time and easy terms. We also furnished lumber from our mill to those desiring to build. We built four modern cottages on large lots for rent to our principal employees. No attempt was made to "boom" this village and speculation was discouraged. It has school, church, post office, hotel, restaurant, two stores, daily stage, weekly train for freight, and at the turkey-distribution last Christmas forty-six heads of families showed up at the office. Some of our friends have smiled at our expenditure as being too large for the object attained. We have plastered some buildings where boards might have served, but there has been no complaint of lice. We have spent a few hundred dollars for paint and whitewash on buildings that we expect to use for many years. When the I. W. W. called out men in June, seriously crippling many camps, not one of our two hundred and thirteen men quit, and during the past year our men have been more steady than ever before.

This camp is the natural village point for at least twenty square miles of logged-off land and while we may, after a few years, ask most of the woodsmen to go into temporary camps, this headquarters is justified for both economic and sentimental standpoints.

Good machinery is important in all woods operations, but even more vital is a force of sober, efficient, contented men.

New B. C. Company Commencing Operations

Operations were recently commenced on some of the machines installed by the Empire Lumber Company at their new mill at Deep Bay, on Cowichan Lake, Vancouver Island, B.C. In the course of a few weeks it is expected that the complete plant will be in running order.

The contract for the erection of the buildings was only let five weeks previously to Messrs. A. J. Ratcliff & Company of Victoria,

and during that time the site has been cleared and the first unit of the new buildings turned over to the owners for operation.

The mill, which will ultimately have a capacity for cutting 25,000 feet per day, is to be fully equipped with the most modern machinery known to the lumber industry. At present there is one planer, one edger and one shingle cutting machine in place, and the mill is employing about seventy-five men in various operations. When the mill is working to capacity it is estimated that not less than 400 men will find employment. The mill is also to be equipped with a machine for cutting ties, and with the development of the railway system on the island it is expected that there will be a ready market for this material.

For the present the company will be busy cutting the framework and dimension to be used in the erection of the office buildings and the balance of the projected plant, and when this mill is completed work will be begun on the new mill at Crofton, B. C., which will be located on tide water, and which it is said will be the largest lumber mill of its kind in the Province outside of the Fraser mills at New Westminster.

The lumber, which is to be cut, will be obtained from a tract about 60,000 acres in extent, which has been obtained from the E. & N. Railroad Company. For more than a month there have been ten gangs of fellers in the district with a full complement of buckers. The timber, which is said to be of particularly fine quality, consists in large proportion of Douglas fir, although there is some cedar and hemlock on the property. Two flying machines have been set up for logging purposes, and one logging engine is at work, while it is proposed to construct about seven miles of track in the near future to facilitate the quick handling of the logs.

Two motor boats have been purchased by the company for the delivery of orders for the local trade, the mill, which is situated about ten miles from the railway station, being practically in the middle of the company's property. The Canadian Northern Railway, which is already graded, runs through the mill-yard.

Pulpwood Areas Have Avoided Fire Loss

Gratifying conditions as to the preservation of the pulpwood in northern Ontario were reported by the Hon. W. H. Hearst, Minister of Lands, Forests and Mines, upon his return recently from a tour in this section of the province. Hon. Mr. Hearst expressed himself as highly pleased with the effectiveness of the new fire-ranging regulations, which went into effect last spring. There has been a marked absence of fire loss this season among the pulp areas, and conditions generally in the north country are promising. One of the matters occupying the attention of the Minister is the Lake Huron and Algoma Northern Railway, for whose construction was passed a bill last session. The promoters have made application for the expenditure of certain funds along the route with the result that the Minister anticipates that the railway will become a reality. The proposed line will be from Bruce Mines northward to a juncture with the Trans-continental.

Toronto Harbour Will Require Much Timber

The Canadian Stewart Company, which recently secured the contract for constructing the improvements to Toronto harbor at a cost of \$5,371,732, will require a large amount of timber for the work. It is estimated that in round figures the work will consume 21,000,000 feet of British Columbia fir or southern pine, with 11,000,000 feet of hemlock and 63,000 piles, ranging in length from 28 feet to 40 feet, which will aggregate in the neighborhood of 9,000,000 feet board measure. The piles will be white pine, cedar, spruce, yellow pine, fir, red pine or any other good timber suitable for the purpose. The total requirements for the work will therefore be in the neighborhood of 41,000,000 feet and their value, roughly speaking, will be \$1,250,000. This large demand for timber is expected to have a good effect upon the market in the near future.

Iroquois Falls Plant Progressing Well

Good progress is being made with the construction of the plant of the Abitibi Pulp & Paper Company, Limited, at Iroquois Falls, Ont. The unwatering for the power is finished and work on the power house has been commenced. The press room and wood preparing room are nearing completion. The sawmill has been in operation for some time cutting fallen lumber and construction timber. The company have decided to use spruce for all timber construction work. The dry kiln, which has a daily capacity of 5,000 feet, is in working order. Bush operations have now been started with two camps of 75 men each and the company anticipate that between 50,000 and 60,000 cords will be delivered at their mill this season. They expect to start grinding operations some time in the winter when they will use about 5,000 cords a month. The branch line to Iroquois Falls has been completed and is now in operation.

Forest Policies in British Columbia

Instructive Comparison of Logging and Protective Methods With Those in Use in the Northwestern States

By H. R. MacMillan*

H. R. MacMillan

The industry which this Congress represents is so much older and so much further advanced in the Northwestern States than it is in British Columbia that I fear there is but little in the present working out of the forest policies of British Columbia that may be of interest or use to you.

The most important general policy in British Columbia at the present day is the improvement of fire protection. The method of timber ownership in British Columbia is so different from that in the Northwestern States that it has been found necessary to adopt a different means of raising the money necessary for fire protection.

In the Northwestern States you have large areas of the most valuable timberland owned outright by private holders who

have by getting together in such congresses as this and co-operating through your highly developed fire protection associations succeeded in rendering fire protective methods almost perfect.

The expenses of this fire protection, in which the government has no direct interest, are naturally borne in full by the owners of the timber, who also initiate and carry out the work without government assistance. In other districts you have very valuable timber in the National Forests in which private owners have no interest and for which the government, acting on its own initiative, has developed a system of fire protection which has been unparalleled elsewhere in the world.

A study of the methods leading to your well-known success in fire protection made it apparent that in striving for the same results we must adopt different methods because of what will appear to you the complicated system of timber ownership in British Columbia.

Although the whole of the province is forested and in need of protection, less than 2,000,000 acres of timberland has been patented and even in a great part of this land the government has an interest in the timber to the extent of a royalty of 50c per thousand to be paid when the timber is cut. There is an additional holding of 1,000,000 acres upon which the cutting rights have been leased subject to royalty and about eight and three-quarter million acre licenses have been granted for logging purposes, the holders of the licenses paying, as you know, revenue to the government in the form of a comparatively high annual rental and paying stumpage to the government when the timber is cut.

These Crown grants, leased and licensed timber lands aggregating nearly twelve million acres in area, which are held in partnership between the government and the private timber owner were all selected prior to 1908 and in most cases were selected on unsurveyed country. They cover naturally the best logging chances in the province so far as could be judged at that time in the absence of survey and developed transportation systems. The whole of the remainder of the province is owned outright by the government. It must be admitted that this great area of unalienated public lands, aggregating nearly 300,000,000 acres is chiefly wooded, and so far as fire protection is concerned is largely inaccessible. Nevertheless it is estimated that even at the present time it contains fully one-third as much accessible merchantable timber as may be found in the lands held by private interests. Undoubtedly, as transportation facilities increase in the northern central portions of the province, a demand will arise for the timber in the thousands of square miles of spruce, pine and balsam forests which, though at present considered worthless, will cut about the same quantity per acre as the spruce and balsam regions of Eastern Canada and the United States.

It has been impossible to dissociate the private and the government interest in fire protection as you have done. Therefore a system of co-operation has been developed whereby private owners contribute each year 1½ cents per acre for their holdings, the govern-

ment contributes an equal aggregate sum and the fund so secured is used for fire protective purposes solely, first attention being paid naturally to the protection of the timber from which the government receives revenue. This fund this year totals about \$375,000.

As the settlement increases and fire danger increases and the large areas of unlicensed public forest lands become more valuable, demanding special fire protection, it may be advisable for the government to make special allowances for this expenditure.

When a good fire season leaves a balance from the year's fire protection fund, this balance becomes available for permanent improvements for fire protection, whenever the fire danger permits, the regular patrolmen and rangers are drafted from patrolmen to labor or improvements. This was done in May and June of this year and again in August in the regions where no more fires were expected. Practically the whole staff were transferred to permanent improvements. In this way the good patrolmen are given as long a season's employment as possible. There are now completed or under construction by the Forest Branch 1,805 miles of trail, 529 miles of telephone line, in addition to lookout points, cabins and boats for water patrol. These improvements are not confined to government lands in which private persons are interested. They are practically all constructed through private timber holdings, the private owners in many instances co-operating in their cost.

You have observed by this time that our practices in raising and spending money for fire protection are based on your experiences during the past five years. Similarly our methods of controlling fire hazards are very similar to yours. I shall therefore acknowledge that in preventing fires we are endeavoring to do as you have done and shall only refer briefly to the railroad and slash hazards.

Under our existing legislation, railroad construction and operation are closely safeguarded in the most remote forest regions of the province. This safeguarding is done at the expense of the railroads themselves. Under Dominion or Provincial legislation, which covers all railroads, the Forest Branch puts on such patrol as may be necessary along railroad construction, supervises the patrol and charges the total expense to the railroad company. Contractors are required to secure permits before lighting fires, and to burn all slash resulting from road making, camp building or right of way clearing. This has been found necessary as the class of labor employed by railway contractors is certain to start fires in slashing. Each year the Forest Branch examines all operating railway lines and specifies where right of way clearing is necessary, and the sections over which speeder or foot patrol is necessary. The railway companies are required by law to carry out these recommendations. The patrolmen register at the stations. The patrol is supervised by Forest Branch inspectors and is kept constant throughout the danger season. The locomotives are inspected monthly and oftener by Forest Branch officials and if unsatisfactory are ordered from use until repaired. Every mile of Canadian and United States railway in British Columbia is operating under these regulations. The Forest Branch supervises as carefully the patrol through privately owned timber as through government timber. The actual co-operation of the railroad officials after the regulations were enforced has made the supervision a pleasure.

We have no compulsory slash disposal law in British Columbia. Until recently there has been a prejudice against slash burning. Fortunately this is dying away. Loggers see that in nearly all districts slash burning is their only protection. Special efforts are being made now by the Forest Branch through correspondence and interviews each Fall and Spring to have the slash of the preceding year burned. This policy is succeeding. Over 20,000 acres were burned this spring and it is hoped to exceed that this fall. About 75,000 acres are cut over per year.

While protecting the forest from fire the government is not endeavoring to lock it up against use. All timber on vacant Crown lands is open for purchase by loggers. The terms are easy, being as a rule payment of ten per cent. of the total estimated value in cash, the payment of a low annual rental and the payment of the balance as the timber is cut. The conditions attached to the contract are that the timber be not held for speculation but be logged within a period of years, so fixed as to be reasonable for the bona-fide logger; that good judgment be used in removing all merchantable timber, leaving none in high stumps, long tops or wasted trees and logs, and that the brush be disposed of according to the contract.

This policy of selling timber which corresponds closely with

* Chief Forester for British Columbia—Address delivered before the Pacific Logging Congress, at Spokane, Wash., Sept. 24th to 27th.

that in practice on your national forests, being framed to assist the actual logger, secure full value for the timber and insure fire protection, is meeting with success. During the past year, sixty sales have been completed or arranged involving three hundred million feet, worth about \$400,000 and sixty-five applications have been received for one hundred million feet additional.

As the government is a part owner of the timber it is interested in how logging is carried on. For this reason logging operations are regularly inspected. It is purposed that hereafter all logging operations in the province will be inspected not less often than once in three months. The object of this inspection is to prevent trespass on adjoining Crown lands, to ascertain that the timber is being logged as closely as market conditions allow, to improve fire protection and to insure that the government secures proper royalty for all timber cut.

The policy with regard to settlement on timbered lands differs in British Columbia from that in the United States. Settlement is naturally not allowed on leased or licensed timberlands though it is provided that the Department may cancel and offer for settlement, leases and licenses which do not carry merchantable timber. Public lands are only offered for settlement where the timber averages less

than 8,000 feet per acre west of the Cascades and 5,000 feet per acre east of the Cascades. It is the duty of the Forest Branch to examine areas applied for by settlers in timbered districts to prevent the alienation of timberland. This policy is a protection to the government revenue, as it provides against the alienation of valuable timber. It is a protection to the timber owner, as it relieves him of the fire danger which follows settlement in timber districts, and it is a protection to the bona-fide settler, who would often, in ignorance of local conditions, locate in heavy timber where he could not make a living farming.

The logging congress is developing the profession of logging engineering. That profession will, as the loggers present from our province will tell you, find there many opportunities for its development. It is a country of high logging costs and it is where you have rough ground, steep slopes and long hauls that the logging engineer will make possible your profit. Therefore education in this applied science is of greatest interest to the government as the largest timber holder in British Columbia. The question of education in forestry and allied subjects at the new University at Vancouver has been taken up by the Minister of Lands and I do not doubt that, before the next congress, some definite announcement will have been made.

May Increase B. C. Timber Royalty

Minister of Lands Receives Representations of Lumbermen—Alterations Suggested—Stability An Essential Requirement

The timber license situation is again up for discussion in British Columbia. Hon. W. R. Ross, Minister of Lands for the province, has held several meetings with lumbermen recently, to discuss the royalty and other features of the question. At a meeting held in Vancouver a large number of lumbermen attended and it was practically the unanimous opinion of those present that an increase in the royalty beyond its present amount of 50c per thousand feet b.m., would inflict a serious hardship upon the business.

Mr. R. H. Alexander, one of the spokesmen for the lumbermen, presented a proposal drawn up by a joint committee of lumber operators, mill owners and limit owners. The proposal was that the present rate of royalty should remain until 1916, when, if an increase had to be made, it should be on No. 1 and No. 2 grades only, on which it should be 75 cts. per thousand feet b.m., an increase of 25 cts. This should remain until 1921 and then raised to \$1, at which figure it should remain until 1926. From 1926 to 1936 the rate should be \$1.25 per thousand feet. The rate of royalty on No. 3 grade should remain at 50 cts. per thousand feet until 1926 and then raised to 75 cts. It was also recommended that the royalty per thousand feet should be uniform on the coast and in the interior.

Mr. T. F. Paterson, speaking for the lumber manufacturers of the coast, said that this year had been the worst in the history of lumbering in British Columbia, and that unless something was done to put the royalty per thousand feet on a stable basis, money would not be given by the banks as loans on timber leases. "There has been much capital invested here, especially British capital, which will not be safely guarded, if some legislation is not enacted whereby a sliding scale of royalty goes into effect immediately, or some other form of uniform basis of royalty is not put through and the lumber industry put on a solid basis," he said. He also stated that the banks were now positively refusing to loan money on a timber lease. He believed that all the timber easily available was now exhausted, and that after three years, to get any timber, the loggers would have to go to an enormous expense. With the royalty per thousand feet on no settled basis, and the banks refusing money, where would the lumber men be? He answered the question that they would be in debt. Mr. Paterson was also of the opinion that some legislation should be passed defining the different grades of timber on which the royalty was based. As it was now, the matter was left to the discretion of the provincial scaler. A uniform set of rules with regard to grading should be put into effect.

Regarding a remark of Mr. Ross that the Panama Canal would help to quicken trade and open up the country, Mr. Paterson was not so optimistic.

License Holders' Objections

Mr. M. S. Loggan, speaking for the license-holders, said that he had copies of letters received from various highly respected houses and reliable banking institutions in the United States and Canada which had refused to loan money on timber licenses in the province because a regular royalty basis for some years ahead had not been installed. One letter from Lyle, Garry & Company, a firm of timber brokers in Chicago, said that "If royalties per thousand feet for the next 25 years can be known in your province we will be glad to consider your proposition." Mr. Loggan was of the opinion that the

lumber industry in British Columbia would be given great assistance if the government royalty per thousand feet were fixed for the next 20 or 25 years.

At a subsequent meeting held in Revelstoke, the following recommendations were made to Hon. W. R. Ross by lumber manufacturers and timber holders located along the main line:—

"In view of the fact that it is the expressed intention of the government to increase royalties on timber removed from special licenses, commencing January 1st, 1916, we beg to submit as follows:

"Reviewing conditions which have existed in the lumber industry during the past ten years, the outstanding fact is the decline which has occurred in the price obtained; statistics indicate that a better price was obtained thirteen years ago than at the present time. Everything that enters into the cost of production has increased by from 50 to 100 per cent., and logging operations are becoming more costly every year, owing to the greater distances over which they are being carried on. Aside from over-production in British Columbia, the determining factor as to the prices obtained has been the vast importation into the prairie provinces owing to lack of protection of the Canadian market. We feel that the lumber industry can not stand any increase in the present scale of royalty.

"However, if it is the determination of the government to exact additional royalty, the joint committee wish to recommend the following for the consideration of the honorable minister of lands:

The Log Scale Difficulty

"First, that we are strenuously opposed to the enforcement of the British Columbia log scale as applicable to timber removed from lands lying east of the Cascade Range, as, on the average, the mills can not saw out the scale. We believe that the Doyle scale should be continued.

"Second, having considered the recommendation of the joint meeting of Coast Lumber Manufacturers and Timber Holders, made to the honorable minister of lands at Vancouver we are of the opinion that, should the proposals of the Coast Lumber Manufacturers and Timber Holders be accepted by the government, in so far as they relate to the establishment of a system of collection of royalty on defined grades of logs for a period of twenty years, commencing January 1st, 1916, a similar system should be followed with regard to timber removal from lands lying east of the Cascade Range; but, we believe that if such a system is put into force, the identical royalties should be payable, grade for grade, on mountain and coast timber. We are strongly of the opinion that the major portion of any increase in royalty should be upon No. 1—or the highest grade of logs, and that No. 2 logs should bear an increase on a ratio of 50 per cent. of an increase on No. 1 logs, and that No. 3 logs, upon which there has never been any profit in manufacture, should bear no increase whatever during the entire period.

"Should the decision of the government be against grading logs for royalty purposes, then, owing to the inferiority of mountain timber as compared with coast timber, and owing to the very unjust inequality now existing in the matter of ground rentals and fire-guarding charges, mountain timber should be required to pay royalty on the basis of one-third less than that chargeable upon coast timber.

"We believe the period for fixed royalties and rentals should be

at least thirty years, for the reason that under existing conditions it is absolutely impossible for manufacturers to obtain any financial assistance upon their timber resources owing to the lack of stability as to carrying charges and royalties. Ground rent should not be increased, and we submit that ground rent be decreased in the interior of British Columbia.

"Since this question has been raised by the government and has resulted in a very general feeling of uncertainty as to what the government's intentions may be for the future, casting grave doubts on the security of timber licenses, we believe that it is the duty of the government to settle this matter definitely at the earliest possible moment."

Recommendations of Mountain Manufacturers

A meeting was held at Cranbrook on September 15th at which the following recommendations were presented to Hon. W. R. Ross by the Mountain Lumber Manufacturers' Association:—In view of

the difficulty existing in this province in connection with a uniform scale being enforced over the whole province, that it is the feeling of this meeting that we recommend legislation being enacted on the basis of collecting royalties on sawn lumber and all forest products throughout the whole province at three per cent. on the net amount of the invoice, after deducting transportation charges, for a period of ten years, and after that time, the royalty be increased one per cent., making the royalty four per cent. for an additional ten years.

In the event of this arrangement not being satisfactory to the department, we wish to point out that the proposed enforcement of the British Columbia rule in the interior would be absolutely ruinous to the lumber business and its attendant industries.

It is further the sense of this meeting that the honorable minister of lands be asked to submit to the offices of the Mountain Lumber Manufacturers' Association, a draft of proposed legislation before such amendment is submitted to the legislature.

Excelsior—Its Manufacture and Uses

How Poplar, Basswood, etc., are Converted into Valuable Packing Material for Upholsterers, Furniture Makers, Mattresses, etc.

By G. A. Turner

EXCELSIOR is a staple article used by upholsterers, carriage, mattress and furniture makers and undertakers. It is also used for packing glassware, china, druggists' and confectionary goods, toys, hardware, and other articles, in fact, its uses for packing are almost unlimited as it is much preferred to hay or straw, being elastic, odorless, and free from dust and dirt. Excelsior is a wood shaving manufactured from basswood, poplar, cottonwood, balsam, spruce, willow, and any wood having a light colored tough straight fibre.

By far the greater quantity of excelsior is cut from small, second growth basswood and poplar, the latter grows in abundance in northern Ontario. The wood is usually cut in 4-foot lengths and peeled. This peeling should be done in the early spring. The wood being peeled, naturally produces a much cleaner manufactured article, besides drying in a much shorter time.

Poplar invariably requires a year to become thoroughly seasoned and should be cross-piled and left in the open to dry in order to obtain the best results. Green or damp wood is unsatisfactory. It does not work up to good advantage, clogging in the machines and otherwise interfering with the work, and when compressed in a bale it will mould and always have a musty smell which is very objectionable in upholstered goods. The wood after being dry should be piled in open sheds with covering sufficient to keep it free from rain or snow.

After the wood is seasoned it is cut into 16 in. lengths, ends being squared so that the excelsior machines can utilize the stick until about

½ in. strip is left. These small strips can be utilized for baling strips. Open-air seasoned wood is preferred to kiln dried, the latter being more or less brittle.

Excelsior Making Machinery

There are two classes of machines on the market for the manufacture of excelsior. The upright double-head machine and the 8-block horizontal machine. Both makes of machines are adjustable for the manufacture of different grades of excelsior and woodwool.

Excelsior is cut from 1-32 in. to ⅛ in. wide and about 1-100 in. thick. However these machines can be adjusted to manufacture from 1-64 in. wide by 5-100 in. thick to ½ in. wide and 1-50 of an inch thick. The coarser the material the more production obtained per day. The finer grade of excelsior or woodwool commands a much higher price.

The double upright machines require about 5 h.p. each and have a capacity of about 1 ton per day, or approximately the product of a cord of 4 ft. wood.

The horizontal machine makers claim a much greater production, two 8-block machines producing 10 tons per day.

Each maker of machines claims to have the advantage over the other, but the writer refrains from passing an opinion.

Excelsior Market Conditions

Excelsior is selling to-day according to location, and quantity purchased, at from \$18 to \$22 per ton, and woodwool at from \$30 to \$35 per ton, the cost of production varying from \$3 to \$5 per ton.

Steam Baling Press—American Saw Mill Machinery Company

Excelsior Cutting Machine

Sliding Table Wood Saw

Barker for Removing Bark from Logs

Most of the large consumers have plants of their own but with the present growth of the country there is an increased demand. A large quantity of excelsior is being used in the making of pads. These pads are made in various widths and length, being a thin layer of excelsior wrapped with a good strong paper. They are used very extensively by the manufacturers of iron and brass beds and all classes of furniture.

The sanitary and bath tub people also use them extensively, the advantages involved being a saving of time in crating, and a saving in material and freights.

There is also an excelsior box pad which is used largely by shippers of glassware, confectionary and biscuits. These pads are made the size of the crate and act as a lining and cushion, thus saving a great deal of broken and damaged goods.

I might also mention that in New York State a pad is made for the end of apple barrels which overcomes heavy pressing and takes up considerable slack, the apples arriving in much better condition and not being bruised and blackened at the ends.

Repairing Rubber Belts

By Robert Moore

From time to time one sees articles on the splicing and general repair of leather belting, but rubber and canvas belts seem to have been neglected.

Nevertheless, they need as much attention as their cousins of leather, particularly in the splicing. Some time ago the writer installed a 36-inch belt that was 50 feet between centres. As belts of this sort are prone to stretch when new, care should be taken in stretching the belt over the pulleys.

First allow $\frac{1}{8}$ inch to each lineal foot of belt for stretch, place the belt in position, put on the clamps and draw them tight. Do not be afraid of breaking the belt as five-ply 10-inch belt will stand a strain of 10,000 pounds, larger ones in proportion; the pulley will collapse first.

Take all the tension the bearings will stand, then turn the shaft slowly back and forth until the clamps touch the pulleys; taking up the slack as it is recovered from the upper half. Neglect to do this will stretch only one-half of the belt, and is apt to cause it to run out of line.

After thoroughly stretching the belt, proceed with the lap, which for a belt of this kind should be 45 inches long. Bear in mind that the lap should always point in the direction of travel over the pulley as in Fig. 1. By so doing any slip of the pulley will have a tendency to smooth down the lap.

Place the board on the clamp rods to rest the splice on; then draw a line squarely across the belt 47 inches from the end. Lay the section off in 2-inch squares, starting one inch from the outer edge as in Fig. 2. Now punch $\frac{1}{4}$ -inch holes where the lines cross. As there are six plies there will be three cuts or scarfs, as shown in Fig. 2. Cut a line just the depth of two plies at the 45-inch line and peel off these two thicknesses; do the same at the 15 and 30-inch lines.

Scarf the other end, place the halves together and punch holes in the lower half, inserting the punch in the holes in the upper half. By so doing, the holes will be directly opposite each other.

Cleanse the surfaces with naphtha and apply a liberal coating of the best rubber cement. Allow this to dry until it will not stick to the fingers, then place the laps together, starting at the edge and rolling the upper one out as it is being cemented so that air may not be entrapped between the surfaces. Then sew the outer edges, using the shoemaker's stitch, shown in Fig. 3.

Alternately roll and pound the joint until it is perfectly flat, then sew each row of holes as was done with the outer ones.

Cut filling strips the width of the space between lacings (most belt

companies sell this duck all prepared), and give them several coats of rubber cement on each side. Clean the face of the belt between the laces with naphtha and give it a liberal coating of cement.

When each surface is dry, that is, when the finger placed lightly to the surface will not adhere, place the strips between the lacing and roll them down.

Now take a piece of duck, the width of the splice, but 4 inches longer and cement this to the face of the belt, covering the joint. By so doing the lacings are protected and except for the occasional renewal of the outer covering the joint is as durable as the belt itself.

In sewing belts of this kind, tip the laces like a shoestring by bending a V-shaped piece of tin around the ends; another way is to use an eyed awl to pull the lace through the belt.

Belts smaller than 10 inches are butted and have a butt strap on the outer surface; this is known as the "back splice." Belts on grindstones, saws, rattlers, etc., where shippers are used will wear on the corners where they are butted, and the outer lace hole will soon tear away if this form of joint is not used. Shippers for belts of this kind should always be of the roller type.

In joining canvas belts always stagger the holes and do not have them less than $1\frac{1}{4}$ inches apart as the fabric is apt to crack across in cold weather.

Another form of joint, known as the "diamond splice," is used on

Stitchings, Splices and Tools for Repairing Rubber Belts.

generators with small pulleys as there is less shock when the lap passes over the pulley, eliminating all flicker of the lamps.

The diamond splice is made in much the same manner as the lap splice except that the scarfs are divided into three equal parts and cut as shown in Fig. 3; it is not so strong a joint as the lap splice, but it is more flexible, therefore better adapted to small pulleys.

Many condemn rubber belts as too cheap or they consider them as a poor substitute for those of leather. This is a mistaken idea. I personally know of rubber belts that have been in continuous operation for years under most exacting conditions, such as dust-laden grinding rooms, dyehouse where the belts were drenched with moisture and outdoor drives subject to all weather conditions.

On a given arc the stretch and compression are the same for one thickness of belt, so that increasing the diameter of the pulley lengthens the life of a belt as the stretch and compression are less per foot. As the thickness of the belt increases so should the diameter of the pulley.

Animal fats and grease should never be used on rubber belts. Boiled linseed oil is good; also equal parts of black lead, red lead, French yellow, litharge and enough japan dryer to make it dry quickly. This will give a smooth polished surface.

Eight Block Excelsior Machine—Lewis T. Kline, Alpena, Mich.

Your Kindling Pile as a Source

The constantly increasing high price of lumber has compelled many users to consider working material which before they have always rejected and due to its not being saleable, many manufacturers have thrown it in to the burner or cut it in short lengths and sold it as kindling wood.

Just take half an hour and walk through your mill and factory stopping at each point where the waste is accumulating and ask yourself, "Can this be saved so as to return a profit?" The man who is familiar with the Linderman method will thoroughly recognize how the waste at many points may be reduced 40 per cent. or even 60 per cent.

In the flooring mill where the hard and soft wood lumber is bundled, where defects are cut out leaving an accumulation of waste of various lengths whose ultimate destination is the kindling pile, fully fifty per cent. of this waste can be converted into flooring. It is true that this flooring is different from any that has ever yet been marketed, but still, owing to the advance in price, it will find a ready sale at \$2.00 or \$3.00 less than the standard price which will yield a vast profit over what can be obtained for it as kindling. The illustration shown above clearly indicates how this can be done. As all flooring manufacturers are thoroughly aware, there is more or less flooring having machine defects on the tongue and groove that prevents its being utilized, yet the face of the board would run as No. 1 or No. 2 grades. If these long lengths were saved instead of being cut up and then, if a number of short lengths which ordinarily would be cut up as kindling were saved, having the ends trimmed accurately and laid out so that their combined lengths would equal the long flooring pieces having defective edges, these can be united into a board 8 in., 10 in. or 12 in. in width and joined together on the Linderman machine so that the entire board has a strength equal to, if not greater than, the wide lumber. Such a floor as this would be very acceptable in all of the cheaper made houses in all parts of the country, where the contractors see that they can save several dollars per thousand. The lasting qualities of the board and its strength are equal to the one-piece stock or narrow widths. This product could also be used for partition work, sub-flooring, shiplap or sheathing.

CANADIAN LINDERMAN COMPANY

e of Profit Rather Than Loss

In the sawmills throughout all parts of the country there are thousands of feet being burned up daily of short length narrow width or edgings which, if a Linderman machine were installed, could be built up into wider stock and this wider stock sold to answer the same purpose as the wide one-piece lumber and give as good satisfaction, although likewise, this stock must be used in the cheaper grade houses and the product sold for a few dollars less.

In the West, particularly, where so much lumber is found having a false heart and narrow strips on either side 2-in., 3-in. and 4-in. wide which now are thrown into the burner, this stock can be ripped, then joined up on a Linderman machine and converted into common lumber or shiplap.

On October 18th last, we were sent a number of samples of 4-in. Saskatchewan spruce to join up for 8-in. shiplap. In returning this lumber we saved one piece as a sample, painted one side and left the other side in the natural wood. This sample we then stood on edge exposed both sides of it to the weather throughout the winter and brought it into the office on March 14th last. On the painted side, after having stood in a steam heated office for two weeks, it is impossible to discern where it is joined, the joints being tight and remaining tight the entire length of the board. On the unpainted side the joint is discernible only by the difference in grain and color of the wood. This is a five months' test of one of the most difficult of all Canadian woods to work and have it retain its shape throughout an open winter which would be harder on glue joints than our usual severe winter, proving conclusively that this product cannot only be used for shiplap or sheathing but can also be used for barns and all other buildings where wide lumber is used.

As a progressive manufacturer who desires to get the last cent. out of his investment, will you not take up your proposition with us and let us show you how we can make a saving for you that will figure from \$3,000 to \$15,000 a year?

, LIMITED, Muskegon, Mich., Woodstock, Ont.

WORKS AT:

Remarkable Old Time Sizes and Grades

The article referring to Mr. W. J. MacBeth, of Toronto, which was published in the Canada Lumberman of August 15th, contained reference to the band box stock turned out by practically the first steam mill operated north of Toronto, that built by Mr. John MacBeth at Gilford, Ont. It is additionally interesting to note that the stock furnished to the band-box manufacturer, Mr. C. W. Maltman, of Toronto, was of quite exceptional size and quality when compared with present day requirements. The smallest piece that would be accepted was $8\frac{1}{4}$ inches thick by 14 inches in width. Any size larger than this could be included. Many of these pieces were from 15 inches to 16 inches thick and from 26 inches to 28 inches wide. All of this stock was absolutely clear. As noted in the article above mentioned, this stock was put through a planer which took off a strip one sixty-fourth of an inch in thickness. The band boxes manufactured from it took first prize at the Centennial Exhibition at Philadelphia.

Miscellaneous Notes of Interest to the Trade

The first lumbering crew to start for the upper St. John river woods left on September 11th to carry on operations for Randolph & Baker, on Green river.

Thomas Meredith, president of the Canadian Pacific Lumber Company, Limited, recently paid a visit of inspection to the firm's plant at Pingston Creek, in the interior.

Makers of small hickory handles for hammers, chisels, and the like, are now trying to use the waste from mills which make hickory spokes and pick and axe handles.

The United States Forest Service is using gasoline railway speeders for fire protection purposes. They follow up trains on steep grades where sparks thrown out by forced draft are likely to start fires along the right of way.

There is much waste in getting out the flawless white oak necessary for tight barrel staves. The United States forest service is trying to get manufacturers of parquet flooring to use some of this waste.

The exceptionally heavy fruit crop at St. Catharines, Ont., this year, has resulted in a scarcity of baskets and the price has recently been advanced to \$60 per thousand for 11 quart baskets. The former price was \$40.

W. J. Banting, general merchant, Edgewood, B.C., intends to erect a small saw and shingle mill at Edgewood within the next year. The mill will have a capacity of about 10,000 to 15,000 feet per day and will contain one shingle machine.

The United States Consul at Aberdeen, Scotland, thinks that American manufacturers may have a chance to compete in furnishing staves for fish barrels. There has been a recent rise in the price of spruce and fir staves from Sweden and Scotland.

A despatch from Aberdeen, Wash., states that the West Coast Lumbermen's Association have decided to curtail their output for ninety days and possibly longer. The decision means a curtailment of about 30,000,000 feet per day, if the entire membership obeys the vote.

The Forest Branch of the Department of Lands of B.C., has arranged to have a series of moving pictures taken of all the operations in connection with the lumbering industry of the province. The pictures will include a series showing the inception and development of a forest fire and the methods of fighting it.

Mr. B. K. Kluck has been appointed tie inspector for the Intercolonial Railway, which involves the creation of a new department. Mr. Kluck has occupied a like position at St. John, N.B., for the C. P. R. for over three years. His duties will be to look after ties, posts and poles from the time of their purchase to their delivery wherever used. The headquarters of Mr. Kluck will be at Moncton, N.B.

An action for \$42,000 has been commenced by the Home Bank of Canada against Sir Rodolphe Forget, Laurent Morin, Edward Pope, all of Montreal, and C. W. Tooke, of Syracuse, N.Y., on a note of \$42,000 given by the East Canada Pulp and Paper Company, Murray Bay, P.Q., to the Banque Internationale du Canada, and guaranteed by the above-named. The endorsers of the note were directors of the East Canada Pulp and Paper Company, now in liquidation.

The Dominion Labor Gazette for August states that in a list of fourteen varieties of lumber, the index number (indicating the price as compared with the average price between 1890 and 1899) during the month of July, 1913, is 179.4. During the month of June, 1913, the index number was identical with that of July. During July, 1912, the index number was 166.9. The meaning of this is that the price of lumber to-day is 179.4 per cent. of what it was on the average during the years from 1890 to 1899.

May Reduce Insurance Charge on St. Lawrence

The Institute of London Underwriters have come to an important decision respecting the high insurance rates which are being charged for the St. Lawrence trade.

According to Mr. H. S. Hanes, the Institute, in consideration of the extensive works undertaken by the Canadian Government for the improvement and safe navigation of the river, has appointed special sub-committees to confer with Lloyds and the marine insurance companies.

Among the alterations to be submitted by the Institute are that vessels be allowed to trade to Halifax and St. Johns without an additional premium being charged, that the period of navigation for a fixed additional premium may be extended to 158 days or to the end of vessels chartered for one voyage than is at present charged for cancelling the Baltic and British North American warranties.

From Beyond the Boundary

A big sawmill owned by the Hines Lumber Company, of Ashland, Wis., was struck by lightning and destroyed by fire recently. The damage is estimated at over \$50,000.

Senator Chamberlain's amendment for a countervailing duty on lumber, in view of the Canadian export tax on logs cut from Crown lands, was defeated in the Senate Finance Committee and in the Democratic caucus; and this, together with other changes, places practically all forest products in every form upon the free list.

The United States Forest Service has entered into an agreement with the state of North Carolina for a co-operative study of forestry conditions in the Piedmont region. This study will determine the proportion of forest lands and the relative value of lands for timber and for agriculture. It will take into account the present status of lumbering, the causes and effects of forest fires, will recommend a system of co-operative fire protection and forest planting. This is the first co-operative work of this scope between the federal government and the state.

B. C. Government Studying Cut-over Lands

The government of British Columbia is about to commence a survey of fifty expired timber licenses in the Comox district. They comprise some 30,000 acres, and it is possible that a quantity of this land may be found suitable for settlement. If so, these lands will be thrown open for pre-emption. Outside of the Comox district there are some 1,200 expired timber licenses which will be examined as speedily as possible. The policy of the forest branch is to ascertain exactly the nature of the land in these expired timber areas and to utilize it for the purpose for which it is best suited.

Studying Ontario's Timber Problems

Prof. Zavitz, Forestry Commissioner for the province of Ontario, has been deputed by the Ontario Department of Lands, Forests and Mines to study the whole question of the management of the timber reserves of the province. It is expected that when the legislature meets next session, Prof. Zavitz will have a comprehensive scheme to submit. The chief questions to be considered are fire protection and reforestation. The intention of the government is, not only to maintain the present fire ranging force, but to strengthen it. Part of the plan is to cut wide fire belts through the most valuable stretches of pine forests, so that more efficient patrol may be maintained.

Partington Company's Operations

The Partington Pulp and Paper Company, St. John, N.B., are rebuilding the dam at Marysville, which was carried away by the freshet last spring. The rebuilding of the dam is necessary for driving the lumber in the Nashwaak river. The company have not yet decided whether, they will operate the mill at Marysville. Last winter the Partington Company cut 12,000,000 feet of lumber on the Nashwaak and 4,000,000 feet on the Bartholomew, 16,000,000 feet in all. The cut will be greatly curtailed next winter, particularly on the Nashwaak. This curtailment will be made because a considerable quantity of the cut in 1913 was hung up.

Barbados Trade Report

S. P. Musson, Son & Company, Barbados, report under recent date as follows:—Lumberstuffs—White pine—There has been no arrival during the fortnight, but we understand a few cargoes have lately been sold to arrive. These are on the way and will fill present requirements. Spruce—No arrival in this either, but market is supplied from recent landings. Pitch pine—No receipts. Shingles—The S. S. "Korona" from New York brought a small lot of 38,000 Long Gaspé, which sold at \$5. The lot of 80 in. to selves ex "Rhodesian" mentioned in our last, we placed at \$8.50, being of very superior quality.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

A Growing Saw Mill Machinery Firm

Messrs. P. Payette & Company, of Penetanguishene, Ont., saw mill machinery manufacturers, have recently made several large installations in different mills through the country. The lath mill equipment in the new mill of the C. Beck Manufacturing Company, Limited, of Penetang, was supplied by this firm. The lath equipment is similar to the equipment in their other mill on which a record cut was made of 128,000 pieces in ten hours. The new modern saw mill of Graves, Bigwood & Company, at Byng Inlet, has also been supplied with their lath mill, bolter and picket mill. Besides these the company have made a number of installations of their Payette patent mill dogs, so extensively in use throughout the country.

By the sudden death of the founder of this concern, Mr. Peter Payette, a couple of months ago, Mr. J. T. Payette has become man-

A Remarkable Lubricant Record

The following letter which the Joseph Dixon Crucible Company of Jersey City, N.J., sends us is of much interest. It should be borne in mind, in reading this letter, that the trolley wheel probably is the hardest worked part of electric railway equipment and receives scant attention until there is trouble.

The Lake Shore Electric Railway Company,
Fremont, Ohio, June 20, 1913.

Joseph Dixon Crucible Company,
Jersey City, N.J.

Gentlemen:—Referring to your communication of May 16, which was in reference to your Graphite Cup Grease No. 2 which we are using on our trolley wheels; we have been using this for the past four or five years for trolley lubrication.

We manufacture our own trolley wheels and they are so constructed that we have an extra large chamber for lubricant. We use a graphite bushing for a $\frac{5}{8}$ in. pin 2 in. long only. We take the Graphite Cup Grease No. 2 and thin it slightly with oil, making it somewhat thinner in the winter than in the summer. This lubricant is then forced into the chambers of the wheel with a force pump in our shop and the wheel is then put into the harp attached to pole and is ready for service, and this is all the lubrication that is required for the life of the wheel. In the majority of cases we use the bushing over again on the second wheel. We have an air press for forcing these bushings in and out of wheel.

During the past sixteen years we have done considerable experimenting in trolley wheels and lubricants with different kinds of trolley wheels and different kinds of lubricants, and it has been our experience that the Dixon Graphite Cup Grease No. 2 is the very best lubricant that can be obtained for this purpose.

On trial equipments we have operated trolley wheels for seven and eight thousand miles; however, in figuring up our average mileage on trolley wheels by the year, taking into consideration wheels that are lost, broken and in some cases stolen, our average mileage is approximately 4,000 miles.

Yours truly, Fred Heckler,
Superintendent M. P. & C.

A Useful Trade Souvenir

The Long Lumber Company, Hamilton, Ont., have sent out to their friends in the trade a couple of very useful pencils advertising their wholesale office and their retail yard. The pencils contain very thick and soft lead suitable for marking lumber and also suitable for many uses in the office. Those who are fortunate enough to receive these souvenirs will be much pleased with them and their regret will only be that the Long Lumber Company have not about a dozen yards needing advertising.

The report of the National Lumber Manufacturers' Association for the month of July showed that according to the receipts of 716 mills, the cut exceeded the shipments by 117,600,000 feet. According to the reports of 629 mills for July, 1912, and July, 1913, the cut for July, 1913, exceeded that for July, 1912, by 700,000 feet, or .006 per cent. Shipments during July, 1913, by the same mills decreased, as compared with July, 1912, by 124,700,000 feet, or .113 per cent. During July, 1912, the excess of shipments over cut was 18,300,000 feet. During July, 1913, the excess of cut over shipments by these 629 mills was 107,000,000 feet.

The Forest Product Exposition has made considerable progress recently toward becoming an accomplished undertaking. The dates for the first two events have been decided. The first will take place at the Coliseum, Chicago, from April 30th to May 9th, 1914. The second will take place at the Grand Central Palace, New York, from May 21st to May 30th, 1914. Mr. George S. Wood, Chicago, has been appointed manager of the exposition. Mr. Wood has been connected with many expositions, trade shows, etc., in Chicago and under his direction it is expected that the Forest Products Exposition will be a great success.

Plant of P. Payette & Co., Penetanguishene

ager of the company. Mr. Payette has been in the service of the company for over 15 years. He has had a thorough grounding in both the business and mechanical end of the work and brings to the manager's chair an experience and business ability that are bound to result in even greater success for this growing concern.

The Capital Wire Cloth and Manufacturing Co., Limited

The Capital Wire Cloth & Manufacturing Company, Limited, of Ottawa, although running only about a year, are turning out a line of Fourdrinier wires and cylinder covers for the pulp and paper mill trade which is finding special favor among the mills from coast to coast. Realizing the importance of the growing pulp and paper mill trade in Canada, Mr. J. R. Buchanan, the president, decided to build a factory in Canada and supply our mills with the "Canadian Made" product. That this has been appreciated by the trade, the large orders coming in from mills all over the country, prove forcible. Mr. Buchanan has had years of experience in all branches of wire cloth manufacture in the largest mills in the United States, and associated with him are a staff of men, all experts in their particular line. Besides manufacturing Fourdrinier wire and cylinder covers, the company also specialize in the repairing and recovering of dandy rolls and cylinder moulds. The officers of the company associated with Mr. Buchanan are:—Messrs. Frank Haefs, vice-president; J. W. Perazzo, secretary and treasurer; and M. L. Peebles, superintendent.

A Sign of Good Business Conditions

The Grand Rapids Veneer Works, Grand Rapids, Mich., report that business conditions at present are much better than they were a year ago. In a letter to the Canada Lumber they say:—"We consider the outlook for business for the fall and winter excellent." Among recent orders which they have secured are the following:—Geo. Palmer Lumber Company, La Grande, Ore.; Hammond Lumber Company, Eureka, Calif.; Booth Kelly Lumber Company, Eugene, Ore.; Baker White Pine Lumber Company, Baker, Ore.; John Fenderson & Company, Sayabec, Que.; Wheeler Lumber Company, Wheeler,

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Beech, Birch and Hard Maple.

1 x 1 x 42.
1 x 1 x 48.
1 x 1 1/2 x 42.
1 x 1 1/2 x 48.
1 x 1 3/4 x 42.
1 x 1 3/4 x 48.

Require Thickness, 1/16-in. Plump.

Quality—Free from all defects.

Can take delivery of green or dry stock.

Apply to The Canada Wood Specialty Co., Ltd., Orillia, for full particulars, price, etc. 24-1-TF

Wanted to Buy

We are in the market to buy the following lumber:

1 carload 1 1/2-in., 1s and 2s, dry quartered Rock Maple, 5-in. and up wide, 8/16 ft. long.

1 carload Rock Elm.

Also Hickory squares, as follows:

100 gross 26-in. x 1 1/2-in. first growth.

1 car 26-in. x 1 1/2-in. second growth.

1 car 26-in. x 1 5/8-in. sec. growth.

5 cars plain white Oak, various dimensions, 6-in. and up wide.

2 cars Rock Maple, various dimensions, 6-in. and up, average 9-in.

Rock Maple logs, 20 to 23-in. diameter at small end.

Rock Maple logs, 24 to 30-in. diameter at small end.

White Ash logs, 10 to 18-in. diameter at small end.

State best prices net cash. Delivery to be made as much as possible this season, balance next. Apply P. O. Box No. 1595, Montreal, Que. 16-t.f.

WANTED — Maple axles, ash or oak tongues. 2-in. oak plank in car lots or less. Tell us what you have. Jackson Wagon Co., St. George, Ont. 19-20

WANTED—A number of cars of 4/4 Birch and Maple for winter delivery. State price, grades and shipping point. Apply Box 847, Canada Lumberman, Toronto, Ont. 16-19

We Want to Buy

about 100,000 feet of 5/4-in. Soft Maple, Log Run Dead Culls.

The Glengarry Lumber Company, Ltd., Berlin, Ont. 19-20-21

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

SALE OF Red and White Pine Timber

Notice is hereby given that tenders will be received by the undersigned up to and including Thursday, the 30th day of October, 1913, for the right to obtain licenses to cut the Red and White Pine timber on timber berths in the Townships of Thistle and McWilliams, in the District of Nipissing.

For maps and conditions of sale apply to the undersigned or to the Crown Timber Agents at Sudbury and North Bay.

W. H. HEARST, Minister of Lands, Forests & Mines. Toronto, August 23rd, 1913.

N.B.—No unauthorized publication of this notice will be paid for. 17-20

For Sale—Small mixed timber limit and Steam Saw Mill, in Eastern Ontario. For full particulars write Box 871 Canada Lumberman, Toronto. 18-t.f.

For Sale

Planing Mill, Sash and Door Factory. Mill in good shape and machinery all in operation. F. J. Moore & Son, Lakefield, Ont. 19-24

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

Miscellaneous

Wanted—Uninjured, live Silver Foxes, Mink and Marten. Reid Bros., Lumbermen & Furriers, Bothwell, Ont. 18-19

New Steel Rails for Sale, 25 and 30 lbs. per yard, with fish plates. A bargain for a quick disposal. Imperial Waste & Metal Co., 713 Queen Street, Montreal, P.Q.

Why Day Work is Preferred

Some new light on the subject of why day work still holds favor with both employer and employee, in the face of the evidence that piece work seems the most logical, is furnished in the idea set forth recently that there is a better chance for promotion and advancement to an authoritative position for the day-workman, writes G. W. O. in the Woodworker, Indianapolis. The argument supporting this idea is, when men are once lined up and placed at piece work, they become what might be termed permanent fixtures in their positions, and are not very likely to be moved up and promoted or changed in any way. In other words, they have reached their goal, and about the only chance for improving their welfare is to develop somewhat greater efficiency and thus secure a little more pay.

On the other hand, it is argued that men working by the day are considered all the time as prospects for advancement, and the man who does the most and best work will get recognition in the course of time that will be worth more to him eventually than it will profit him to work on a piece-work basis and thus get a little more pay for the time being.

This is one of the most interesting angles from which to view this matter. It may be that right here is the explanatory secret of why piece work has not found more favor with the employee.

Sanding Mahogany Furniture

Referring to sanding processes in making mahogany furniture in the plant of the Widdicomb Furniture Co., Grand Rapids, Mich., the Abrasive Age for July says: Today the three-drum sander is the important machine for this essential work, and paper in various numbers, according to the character and quality of the work, is used upon the several drums, from coarse, the first drum, to

respectively finer as the finish of the work may demand. For other portions of the work stroke sanders and various forms of belt sanders are used, with cloth belts covered with the required coarse or fine grain, the belt traveling in one direction. With the stroke sander, however, a much more uniform and a finer finish can be procured, because the stroke sander does its work with an action very near to the working of the human hands. The stroke sander consists of a sanding block attached to a long arm. The arm is driven with an eccentric motion, backwards and forwards, sending the sanding block, which is covered with the abrasive paper of the desired grit, across the surface of the furniture part. In this way this simple yet efficient machine duplicates very closely the action of the human hand in sanding. The pieces are sanded two ways and the pressure is uniform. The result is a fine, uniform finish. A goodly part of the work in the Widdicomb factory is finished up in this way, and the results justify the use of the stroke sander. The one drawback of the stroke sander as compared with the belt or drum sander is that the capacity of the stroke sander is very limited, and it has practically disappeared from many of the furniture factories for this reason. It is still retained, however, in the Widdicomb factory, where time seems to be no object in getting desired results.

Review of Current Trade Conditions

Ontario

One of the most noticeable conditions in connection with the lumber trade of Ontario during the past fortnight has been the fact that hemlock wholesalers have found that many of the yards have lately put in large stocks of shortleaf yellow pine ranging in size from 2 in. x 4 in. to 2 in. x 12 in. and from 10 ft. to 16 ft. in length. This stock has been purchased at prices lower than those for which retailers can buy No. 1. In many cases the stock is delivered at Western towns at the mill price of No. 1 hemlock. These stocks are coming from various mills in the Southern States. Most of the shipments have been the result of lists, sent into Ontario recently, of so-called cars in transit. Retailers are given to believe that these stocks are offered at a specially low price, because the cars are in transit and unsold. Prominent Ontario wholesalers, however, who have answered enquiries of this nature, state that frequently when they order one of these cars they are told that it has been sold, but can be duplicated with very little delay. The conclusion naturally is that these lists are not actual lists of cars in transit, but lists of stocks which can be shipped from the mills. Under these conditions, retailers really are not obtaining specially low prices as they are led to believe. A traveller for a southern firm recently stated while in Toronto that these stocks were being sold in the States at corresponding prices to those asked for in Canada. Whatever the situation may be, yellow pine is to-day cutting very seriously into the hemlock, white pine and Norway pine trade of Ontario. White pine and Norway pine are meeting with keen competition in "B and better" yellow pine, which is being delivered at Western Ontario points at \$31 per thousand feet.

Stocks in retail yards in Ontario are about normal. A good many retailers state that they are not buying stocks now as they want to work them down as low as possible for the winter and be in a position to stock up for next year's trade. Retailers in general expect that next year's trade will be good. This feeling is the result largely of agricultural conditions. In the western part of the province, and in fact generally throughout Ontario, crops of all kinds have been good, with the exception possibly of hay, which is short. Wheat, oats, barley and peas are all above the average. Root crops are good and cattle are looking well. No improvement is reported in connection with shingles or lath.

It is reported that the money situation has eased up considerably during the last two weeks and some builders have been enabled to start operations which had been suspended owing to the money stringency.

Although the market in lumber of all kinds is still somewhat slow it has steadied considerably in the last few weeks. Stocks at mill points are small, and there does not seem to be any overplus of stock at retail yards. Retailers are keeping their stocks low and, when giving orders, require shipments immediately. Cull lumber in both hard and soft woods remains very strong. An improvement has also been noticed in middle grades of pine.

Eastern Canada

The lumber trade at Montreal continues unchanged and on a moderate scale. The outlook for the immediate future is generally considered satisfactory. There is a fair amount of building in progress, but money continues tight. The demand for high grade pine is quiet, but the common ends and hemlock and spruce are moving steadily. The approaching settlement of the United States tariff situation is affecting the lumber trade and buyers are waiting in order to take advantage of the new schedule. An improvement in the demand is expected when the tariff is fixed. Shipments of birch to Great Britain are moderate in amount. Other exports show a slight falling off on account of the difficulty in securing space in tramp vessels. The demand for ground wood is improving, as United States mills have used up most of their accumulated stocks.

The New York market for eastern spruce continues quiet, but prices are steady. Yards are not buying ahead to any extent on account of the dullness in the building situation. Mill stocks are reported plentiful, but are not being forced on the market. There are indications that the larger yards which buy extensively will shortly be taking advantage of the low prices and laying in stocks. Hemlock stocks are not active, as the suburban situation is dull. Stocks at mill points are reported light and quotations are unchanged. The hardwood market at New York has improved. Quotations are a little better and the demand in nearly all grades is more active. Large consuming orders however, are slow in coming out. Plain and quar-

tered oak are strong. The market for maple, birch and chestnut is better. Wholesalers are of the opinion that a slightly better run of prices may be expected.

A slight improvement is reported in the lumber industry at St. John, N.B., as some of the mills have been able to secure enough outside help to start operating again, in spite of the strike. Prices are difficult to quote. Refuse lumber of all kinds is bringing \$12 to \$13 per M. The English deal trade is a little firmer, but strikes at Liverpool, Manchester and other ports are causing much trouble and buyers are not active. A North Shore company is reported to have sold its English deals at \$17.50 at the mill. American business is quiet, but the New York market shows a tendency to improve. "No mark" logs, at the recent sale brought \$14 for spruce, \$10 for pine, \$9 for hemlock and \$7.75 for cedar. The present outlook is that this winter's operations on the St. John will be exceptionally small.

The Boston market for white pine selects, 1 in. and 2 in., continues firm, the price being about \$90. 1 x 12 in. No. 2 barn boards are firm at \$42. Canadian spruce boards are a shade easier at \$26, and spruce dimension, 12 x 12 in. is selling at about \$27.50. Random spruce 10 ft. and up, from 2 x 3 in. to 2 x 7 in. and 3 x 4 in. are all a shade easier, the price being from \$22 to \$23. Spruce laths are not in such good demand, the price being \$4.35 for 1 5/8 in. and \$4 for 1 1/2 in. New Brunswick cedar shingles are easier, prices being about as follows:—extras, \$3.90 to \$4, clears, \$3.65.

United States

The tariff uncertainty has continued until quite recently to exercise an important influence upon lumber trade conditions in the United States. This uncertainty is now practically over and business men may soon be expected to consider their future requirements. The effects of the revision of the tariff downward have probably been discounted by this time. The volume of sales and shipments during September was not as heavy as was expected, most of the buying having been the result of necessity. The trade did not show any volume of stocking up orders. Trade, as a whole, practically marked time during September, everyone waiting for positive developments. The movement of cotton, sugar and other products is likely before long to bring on an important car shortage and to cause trouble for those who have not laid in stocks. The general result of the cereal crops will be favorable to business. The wheat crop broke all records, totalling 23,000,000 bushels more than last year and 6,000,000 bushels more than the yield in 1911. Southern pine continues to show no change. In spite of curtailed production, far too much lumber is being manufactured for the present demand. Car companies are sending out many enquiries, but actual orders are scarce. The demand for dimension seems to be on the increase, but prices are still low. Apparently the trade in September was a little better than in August.

The demand for northern pine is improving. Minneapolis firms report a greater volume of orders and enquiries from retailers. In the Great Lakes region a better supply of hemlock is reported than a month ago. The demand continues good and prices are a little firmer. Manufacturers have reduced their concession sheets by 50c and are now selling hemlock at \$1 to \$1.50 off the February list. In spite of the competition of southern pine, the hemlock market has held up better than usual, having proved its value as a cheap and reliable wood for piece stuff and car boarding and siding. The most satisfactory section of the lumber trade is the hardwood industry, although there is not much buying ahead, immediate requirements are for larger quantities than usual.

Great Britain

The timber trade at London continues good and deliveries at the docks are still heavy. Most of the firms are doing a good, profitable and steady business and are quite pleased with the outlook for the future. In spite of labor troubles the building trade continues very active, prospects being brighter in fact, than they have been for some time. At Churchill and Sim's recent auction sale, 3 x 10 in., 10/16 feet, dry second pine from Montreal was sold at £22. Messrs. Churchill and Sim in their wood circular under date of September 3rd say:—"Very little change has been seen in the general wood market during August, but deliveries in the London area continued to expand, and an increase of some 6,000 standards over last year's total for the month is satisfactory, and brings the aggregate delivery for the first eight months of the year to 196,000 standards, against 155,000 standards for the same period of 1912. The whole of this improvement is seen in the direct deliveries from ship to craft, and the market

for stock stored at the docks is becoming more and more governed by quotations for overside delivery, so that merchants are finding some difficulty in re-imbursing themselves their landing expenses, and are inclined to quit their balances at the closest margin of profit rather than incur them."

The same report also says:—"The outlet for American oak logs is so limited that consignments cannot be recommended. Quartered planks and boards:—business is dull, but prices are no weaker. Plain wood:—there is still a considerable stock on hand, but supplies have fallen off, and there is a fairly steady demand, therefore the position should gradually improve. Sill planks:—prices continue somewhat weak, and consignments should be made with caution."

At Liverpool the trade showed an improvement early in September over that of the previous two months, enquiries being better and showing signs of continued improvement. Pitch pine was enjoying a fair spot trade at Liverpool, but the prices were so low as to leave

the profits almost nil. Apparently southern pine is being dumped into Liverpool in similar manner to Canada. "Timber" of London, England, referring to this in a recent issue says:—"Nothing seems to deter shippers from dumping their goods on to this market; it puzzles us to even guess at their motive, as the difference in the prices obtainable to-day and the prices they would obtain if they held their stocks on the other side for three or four months would cover the loss of interest, and leave them a handsome margin in addition over and above any profits they may be making now."

The spruce market at Liverpool is unchanged and is the money-making market at present. Manchester trade continues good with a steady demand and fair volume. Prices are unchanged although pitch pine is a little weaker. Importers of American hardwoods find that shippers are asking very high prices, the excuse being the high freight. Very little business is being done, importers preferring to play a waiting game.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John Mills Again Operating

St. John, N.B., September 20th; (Special to the Canada Lumberman).—A slight improvement, though not very pronounced, has taken place in the lumber industry at the Port of St. John, during the past two weeks. Messrs. Randolph and Baker have been able to start their mill, having brought in outside help, to a large extent, as the deal pilers who went on strike have not yet returned to work. The mill is now running at full capacity and the owners do not anticipate any further trouble from their men, although the longshoremen, who stirred the trouble here, say they will not handle the deals for shipment. As the deals are sold at the mill, this is not causing the owners any uneasiness. On Thursday of the present week Messrs. Murray & Gregory started one-half of their mill, under the old conditions, and while they are handicapped to some extent, they feel that in a few days they will have the entire mill in operation. Messrs. Stetson Cutler & Company are also operating their shingle mill at Pleasant Point, but up to date have not been able to start their long lumber mills.

The strikers are still out, and it is probable that they will not return to work this year, as the owners feel they are paying all the wages the business will stand and that if the men persist in standing off, outside help will come in, and in time, with a number of their old hands, the mills will be started again, but not until next year.

All the building trades are about demoralized on account of this strike and the city in general is feeling it pretty badly. Many unsuccessful attempts have been made to settle the dispute but the men are so split up in their ideas that it is impossible to do anything. It is felt that the longer it progresses the more seriously it will be felt, as St. John depends largely on its lumber industry for its trade directly and indirectly. Many of the carpenters have been thrown out of employment, and persons who figured upon building find it impossible to obtain the material to work with.

No quotations can be made on lumber, as the only lumber for sale here is that coming in from outside points, largely from the small rotary mills in the interior. Refuse lumber of all kinds is being sold from the factories and yards at from \$12 to \$13 per M., according to how badly the buyer is in need, as the retailers are taking every advantage they can. Frames of all kinds are from four to five dollars higher, and hard to find. Shingles have been brought in from outside points and have sold from fifty to seventy-five cents per M. over old prices. It has been very hard to buy shingles from outside the city, as the mills sawing cedar were, some of them, booked two months ahead.

Lime is also being imported from Rockland, a thing which has not occurred before and the price has advanced seventy-five cents per barrel.

English Deal Trade Firmer

The English deal market was firm from last reports, although during the last week the buyers have refused to make any new trades for winter shipment until the position of the strike at Liverpool, Manchester and other ports has been settled. Should this strike continue to spread, it is felt that it will also mean another serious drawback for the manufacturers all over the province, as many of the winter mills located near or hauled their deals to the railways and shipped into St. John for the liners during winter. It is said that one concern on the North Shore sold their English deals some two weeks ago at \$17.50 at the mill. The Donaldson and Manchester boats will take

away from this port during the next week about three million feet of deals, being largely made up of lots from the interior mills. All the old deals being cleared off the wharves here.

Very little business is being transacted at this port with the American market, but it is understood that the market at New York shows a tendency to stiffen, and it is felt that a natural rise will take place in the market before late fall. More enquiries for lath and long lumber are coming to hand than previously. Short, narrow cargoes are being quoted at \$20 to \$23, with the long schedules at about \$25. Very few hemlock boards are being held by the interior mills. They are sawing their logs largely into timber as the demand is heavy for wharf building, and all the boards available are narrow side boards. Timber is being sold at \$14 per M. delivered at St. John, with boards at \$16 per M. Laths are quoted for New York at about \$3.85 per M. A large fleet of schooners are tied up here, being unable to get cargoes owing to the strike here, and also owing to the dullness on the American market.

"No Mark" Log Sale Results

The sale of the "no mark" and mixed mark logs took place at St. John on September 10th. This sale is conducted by the St. John River Log Driving Company, of logs which come into their booms during the season, which either bear no marks at all or have marks which no one has registered at the Boom Company's office. They are sold by the company, the proceeds being divided pro rata among the different operators, according to the quantity of logs sold. Out of about 54,000,000 coming through the booms this season there were over five hundred thousand of these logs. The prices and purchasers were as follows, viz.: Spruce logs, \$14; pine \$10 and hemlock \$9 per M., to the York and Sunbury Milling Company of Fredericton; the cedar to J. A. Morrison of Fredericton at \$7.75 per M.; the drift drive logs were also sold the same day, prices being about the same as above.

It is expected that a new system of rafting logs during the coming season will be tried out at the booms of the St. John River Log Driving Company doing away with the use of boom poles, instead of which the logs will be cross-hauled and bracketted, the present way of putting logs into joints having become very expensive.

Winter Operations Will Probably Be Small

Very little preparation has been made to cut logs for the mills at St. John during the coming winter, and it is felt that it will be very dull along the St. John. The Province of New Brunswick will feel this lack of revenue very much, as the lumber industry is a great boon to the government, Messrs. Randolph and Baker have sent a small crew to Green River. Up to date they are the only millowners who have made a move in this direction.

Montreal Trade Still Quiet

Montreal, September 24th (Special to the Canada Lumberman):—There is practically no change to report in the conditions of the lumber trade, business being still on a moderate scale, with a satisfactory outlook for the immediate future. Building is pretty brisk, despite the holding up of several large schemes. Money is still tight, this being the most untoward feature of the trade. High grade pine is dull, while the common ends, hemlock and spruce command a fair sale.

Pending a tariff settlement, United States buyers are holding off, with a view to getting the advantage of the new schedule. When

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

WE CARRY THE LARGEST AND BEST ASSORTMENT
OF DRY SPRUCE IN CANADA

once the tariff is fixed there is likely to be a considerable improvement in the demand.

It is reported that, owing to the difficulty in getting logs, additional mills have been closed down. This will affect the stocks of lumber that will come on the market next year.

A moderate amount of birch is being shipped to Great Britain. Otherwise there is a falling off in exports, due to a certain extent to the difficulty of getting space in tramps. Another cause of delay is the issue of an order by the Canadian Customs affecting lumber in transit from American points. Hitherto cars have been allowed to go on to the docks and the entries afterwards passed, but the Customs recently insisted on the entries being passed before the cars were ordered from the railway yards to the docks. An appeal was made against the order, which has now been cancelled.

Owing to continued low water at the United States mills the accumulated stocks of ground wood there have been used up, and a demand is now being made on Canadian material. A considerable quantity has already been sold, and, with the prospect of further buying orders coming into this market, prices have stiffened a little. Orders have been refused at late prevailing quotations, and the prospect is that prices will go higher.

There is little change in sulphite, which is quiet.

Ottawa Trade Only Fair

Ottawa, September 23; (Special to the Canada Lumberman).—There seems to be a hoo-doo against the lumbermen in Ottawa lately. Early in the season the proposed changes to the United States tariff affected trade from here considerably. For some time not a boat-load of lumber passed through the Rideau Canal for American ports, whereas in other years a brisk business was done. Then followed a period of dry weather which lowered the water in the Ottawa and its tributaries so much that trade was interfered with. Next came serious forest fires whereby local firms lost heavily. A few weeks ago a series of fires in local yards destroyed thousands of dollars' worth of valuable lumber. The latest detrimental factor is the strike of the laborers on the Manchester Ship Canal. One result of this strike is that the regular weekly steamship service between Montreal and Manchester has been crippled and local exporters, with exporters in general, are experiencing great difficulty in getting boats in which to ship lumber. It was hard enough to get accommodation before the strike, but it is infinitely worse now, says Mr. E. R. Brenner, Ottawa manager for Watson & Todd Limited. His testimony is supported by other lumbermen here.

Medium Grades Quieter

Local trade is fair. There has been a considerable falling off in the demand for medium grades, due to some extent to the importation of Californian pine for the manufacture of doors and owing to the local market being unable to compete with American door manufacturers. Prices in any grades have not altered during the past two weeks.

Two more lumber fires occurred in the city and district last week, but fortunately the loss was comparatively little. The first was in the Fraserville yard of J. R. Booth, who has had two other big fires visit his head plant this month, where about \$1,000 damage was done. The other was in the factory of the Greater Ottawa Lumber Company, where the loss was about the same. The cause of the fires is yet unknown.

The water in the Ottawa River is at a lower mark just now than it has been at a similar period of the year for several years, but lumber firms using water power from this river are not likely to be affected to any great extent owing to the fact that the Dominion Govern-

ment has built two big conservation dams on the Upper Ottawa, which are now in operation. A third one is under construction at Lake Quinze.

The annual report of the Trade and Commerce Department giving the imports and exports of Canada for the twelve months ending last June gives some interesting figures to lumbermen. The total import of wood and its manufactures into Canada in 1913 was \$28,701,236 as compared with the 1912 total of \$22,480,032. Of the 1913 total \$27,472,351 came from the United States and \$603,311 from the United Kingdom.

The exports were as follows: logs, 1913 total, \$935,615 as compared with \$907,042 in 1912, \$831,529 going to the United States and \$100,913 to the United Kingdom; deals, pine, 1913 total, \$1,089,617 as compared with \$1,574,425 in 1912, \$70,432 being exported to the United States and \$994,335 to the United Kingdom; deals, spruce and other, \$5,598,387 in 1913 as compared with \$6,126,367 in 1912, \$694,758 to the United States and \$4,800,525 to the United Kingdom; laths, palings and pickets, 1913 total, \$2,120,393 as compared with \$1,850,615 in 1912, \$2,059,754 of this going to the United States and \$22,672 to the United Kingdom; planks and boards, \$20,955,346 in 1913 compared with \$19,655,385 in 1912, \$16,264 to the United States and \$1,902,714 to the United Kingdom; shingles, 1913 total, \$1,431,627 compared with \$1,373,656 in 1912, \$1,398,137 of it to the United States and \$445 to the United Kingdom; square timber, in 1913, \$1,244,488 and in 1912, \$1,377,496, of this \$12,885 to the United States and \$1,215,841 to the United Kingdom; wood blocks for pulp, total in 1913, \$7,162,220 and in 1912, \$5,848,298, all of it going to the United States.

The imports of paper were as follows: paper and manufactures of paper, total in 1913, \$8,671,686 as compared with 1912 total of \$6,806,707. Of this \$5,919,353 came from the United States and \$1,904,137 from the United Kingdom.

The exports were as follows: paper, total in 1913, \$7,902,433 as compared with 1912 total of \$4,080,362; wood blocks for pulp, total in 1913, \$7,162,220 as compared with total in 1912 of \$5,848,298. Of the exports of paper \$5,814,273 was sent to the United States and \$521,118 to the United Kingdom, while the total export of wood blocks for pulp went to the United States. Of woodpulp there was in 1913 exported a total of \$5,542,514 as compared with the 1912 showing of \$5,180,635. Of the total export \$4,490,868 went to the United States and only \$873,237 to the United Kingdom.

The Canadian Manufacturers' Association and Boards of Trade all over the country have been assured by the Grand Trunk and Canadian Pacific Railway Companies that instead of abolishing the cartage facilities on October 1st as originally announced they will continue them until January 1st, providing that the Railway Commission will sanction an increase in the rates amounting to half a cent per hundred pounds. The present rate is two and one-half cents per 100 pounds, the minimum charge being 15 cents. The commission will consider the case very shortly.

Labor Organizers In Canadian Pulp Mills

Probably because of the transfer of American pulp and paper industries to Canada as a result of the tariff changes in the United States, labor leaders are beginning to take an interest in the unionization of employees working in pulp and paper mills in Canada. Robert J. Dickson, international organizer of the employees in the mills, is at present in Ottawa trying to organize the 1,200 to 1,500 men employed in the pulp and paper mills in Ottawa and Hull. At a meeting of the Allied Trades and Labor Council last Friday he stated that if the duty had been removed from paper and left on wood, it would drive the pulp industry to Canada. If this happens he said it would be well to make sure of the eight-hour day here. He cited examples

of how organization on the part of the men had resulted in improved wages and shorter hours.

Police Constable George Finlay came within an ace of death at the J. R. Booth mills last week when he went to quell a disturbance caused by some young men who were interfering with some of the workmen. Some of the rowdies threw him into the sawdust carrier, which was working at the time, and he only regained his feet on the endless chain just as it was nearing the burner. He was rather sorely injured.

Tariff Alterations Affecting Tonawanda Trade

North Tonawanda, Sept. 22. (Special to the Canada Lumberman).—Now that the tariff bill is practically settled, the Tonawandas find that lumber is the chief article of local consumption that is affected. With the exception of novelty siding, beaded ceiling, moulding and similar items, all lumber will be admitted free. At present there is a tariff of \$1.25 per thousand feet on lumber. Fifty cents and twenty cents respectively are charged on lath. The local market was reconciled early in the tariff fight to putting rough lumber on the free list, but they held out to the end against admitting dressed lumber without a tax of some kind. Tonawanda lumbermen to a man are convinced that the passage of the tariff bill without a duty on dressed lumber will close every planing mill on the Niagara frontier within six months and that Canada will reap the benefit. This view is general along the border. Occasionally there is a mill man who ventures the opinion that the new tariff or rather lack of tariff on dressed lumber will adjust itself in a short time and that the dressing of lumber on the American side will continue practically as before but these optimists are few and far between.

The annual fall rush of lumber to the Tonawandas has begun. Coupled with a somewhat quickened demand for nearly all grades of lumber the local market may be said to be taking on an upward trend. Those who have been looking for signs of lower prices in view of certain abandonment of duty on imported lumber are still looking. On the contrary prices are holding as firm as at any time during the last few years and close students of the general situation say that the new tariff bill will not affect prices in the slightest. Box lumber and in fact all of the cheaper grades are in greatest demand but all lines continue strong.

Big cargoes are the order of the day in the Tonawandas. The Str. Norwalk yesterday discharged a cargo of 1,250,000 feet at the

yard of the Wilson Lumber and Box Company. This is one of the biggest loads of lumber that ever came to the Tonawandas on one boat. The reason for the increased tonnage is that stock cut this spring has dried more thoroughly than usual, making it possible to load lake craft several more thousands of feet of stock than is usually the case. In spite of the larger cargoes, tonnage is more in demand and rates are high. Vessel owners easily get \$2.75 for hemlock and \$2.50 for white pine from lake Superior ports with \$2.25 prevailing from shipping points in the Georgian Bay district. Freights will be higher after October 1st and dealers at this end of the lakes are bending every effort to get their purchases on the way before the close of the month. September therefore bids fair to show perhaps the largest receipts of the year.

Lumber is going east over the Erie Canal more extensively than during the same period last year. Last week the report showed 3,505,000 feet to have left the Tonawandas by canal as compared with 3,100,000 feet during the same week a year ago.

New York Markets Improving

Messrs. Simpson, Clapp & Company, New York, in their market letter, under recent date, say:—Since the first of September the outlook for the lumber market has brightened noticeably, and, with any reasonable demand for fall trade, prices for spruce should harden before the end of the season. Several factors have contributed to this result. The long dull summer with its slackened building gave the market a much needed rest. Retail stocks are below normal and receipts of eastern spruce have been light, due to the strike at St. John, the diversion of cargoes to the Boston and Sound markets, and car shipments to Montreal and other Canadian points.

Although we do not anticipate a big rise in prices, general trade reports are more encouraging and we hope for a natural rise in the market before the winter closes in. Already the yellow pine and hardwood markets have stiffened and we find more enquiry for spruce, particularly laths. West Virginia and northern spruce schedules are being held close to list prices.

Pennsylvania and West Virginia hemlock are quoting on a \$24.50 basis, with eastern hemlock schedules selling from \$16.50 to \$19.00 and up, depending upon specifications. We quote No. 1 spruce laths at \$3.80 to \$3.90 per M; short and narrow spruce schedules at \$19.50 to \$23.00, and wide and long schedules at \$23.00 to \$26.00.

Supplies for the Camp

WE make a specialty of this business and just at present are particularly well supplied with goods that are used in Camps.

EDGINGS

Ontario

Dyment & Mickle are considering plans for the erection of a sash and door factory at Fenelon Falls, Ont.

Sommers Bros., Saginaw, Mich., are considering plans for the erection of a match factory to cost \$30,000 at Sarnia, Ont.

The mill belonging to the Sims Lumber Company at Sault Ste. Marie, Ont., was recently destroyed by fire. The loss amounted to \$15,000 which was partly covered by insurance.

The L'Original Stave & Lumber Manufacturing Company, Limited, have been incorporated with capital stock of \$145,000. The incorporators are T. Riufret, K.C., and A. R. W. Plimsoll, Montreal. The head office is at L'Original, Ont.

The Cavendish Company's saw mill at Lakefield, Ont., closed down on September 4th, having completed the cutting of their lumber in that district. Unless some industry comes to take its place, the closing of the mill will mean quite a loss to Lakefield.

The first pulp mill to be located in Western Ontario will be in operation before the end of the year, according to a report made by J. Mathieu, M.P.P., of Fort Frances. The mill will manufacture print paper only and will have a capacity of one hundred tons a day.

The steamer Charles Beatty, the largest lumber boat on the great lakes, arrived at Sarnia recently with a cargo of lumber, comprising 1,200,000 feet, which is the largest ever brought to that port. The boat was loaded at Lake Superior ports and consigned to the Laidlaw Lumber Company.

The Merritt Lumber Company, Limited, has been incorporated with a capital of \$20,000 to manufacture and deal in lumber and other forest products, to open up timber limits, etc., with head office at Sudbury. The provisional directors are J. S. McKessock, J. H. Clary, solicitors, and Colin Argyle Campbell, recorder, all of Sudbury.

A recent despatch from Owen Sound states that tenders are being received for the purchase of the building and plant erected for the Superior Match Company. The factory is located on the C. P. R. tracks, close to the harbor. The company was obliged to abandon its proposition on account of lack of capital. The sale is under the direction of the Court, to satisfy a lien held by the contractors.

The James T. Gilchrist Lumber Company, Limited, was recently incorporated at Toronto with a capital of \$40,000. This company has purchased the wood turning business and planing mill of W. Spanner & Company at Bloor Street and Gladstone Avenue. Mr. James T. Gilchrist is the president and managing director of the new company and Messrs. A. Winchester and A. Brody are provisional directors. Mr. J. T. Gilchrist has been for the past 25 years with Mr. J. C. Gilchrist at his planing mill on Ernest Avenue, and is well known to the trade in Toronto. With his long experience in the planing mill business there is no doubt that he will be successful in his new venture.

Eastern Canada

C. M. Sherwood, Centreville, N.B., is advertising his sawmill for sale.

The Simpson & Marshall Lumber Company, Arthabaska, P.Q., have dissolved.

F. Tremblay & Company, Montreal, suffered loss by fire at their lumber and sash factory. The loss was covered by insurance.

Pelletier & Gariépy, sash and door manufacturers, Montreal, have been registered. The members are Mathias Gariépy and Victor Pelletier.

The sawmill belonging to J. D. McLaughlin, Three Brooks, N.B., was recently destroyed by fire, the loss amounting to \$10,000. The mill will be rebuilt.

George Rousseau's sawmill at Robertson, Que., was destroyed recently by fire. The loss, which amounted to \$4,000 included the mill and all its machinery and equipment.

The Hawkesbury Board and Paper Mills, Limited, have been incorporated at Montreal. The capital stock is \$2,500,000. The incorporators are A. H. Elder, S. T. Mains and A. F. Teulon, of Montreal.

The saw mill belonging to Mr. Geo. Rousseau, at Robertson Station, on the line of the Quebec Central Railway, was completely destroyed by fire recently. The loss is about \$4,000. There was considerable dry lumber stacked in the mill yard but fortunately the fire did not reach it.

The pulp and lumber mills, including the box shed and dynamo, belonging to the Hon. Richard Turner, of Quebec, situated at Lake Edward, were destroyed by fire on September 18th. The loss amounts to \$17,000, and is fully covered by insurance. The loss falls heavily on the people of Lake Edward, as nearly all the families composing the village were dependent upon the mills for a living.

Western Canada

Finch & Withers, lumber dealers, Strathclair, Man., have been burnt out.

McMartin & McMillan, shingle manufacturers, Bradner, B.C., have been succeeded by F. McMillan.

The Vancouver Box Company, Limited, has been incorporated, with head office at Vancouver, B.C., and capital stock of \$100,000 to take over the box

manufacturing business recently acquired by A. Y. Johnstone from the British Columbia Box Company, Limited.

The Arlington Shingle Company, Limited, has been incorporated with capital of \$15,000 and head office at Nanaimo, B.C.

H. H. Bishop, of Thessalon, Ont., has been looking into timber propositions in British Columbia. He is associated with Chicago people.

The Grief Point Shingle Mill & Development Company, Limited, has been incorporated with capital of \$25,000. The head office is at Vancouver, B.C.

The Hatzic Lumber Company's new shingle mill at Hatzic, B.C., just east of Mission Junction, has capacity for ten machines, but only six have been installed.

The B. C. Electric Railway is to construct a line from Port Moody to Lake Coquitlam, which will be used principally for transporting logs to Burrard Inlet.

A woodworking and cabinet making industry has been started at Coquitlam, B.C., by L. W. Hookam, who for five years was designer with Woodcrafts, Limited, of Calgary.

The Ferguson Lumber Company has completed a plant of 60,000 feet capacity at Six-Mile Creek, 30 miles west of Golden, B.C., on the main line of the Canadian Pacific Railway.

The Bridgeport Lumber Company, Limited, has been incorporated, with head office at Vancouver, B.C., and capital stock of \$250,000 to carry on business as timber merchants, sawmill proprietors, etc.

Watkins & James, of Hoquiam, Wash., have bought the timber limits of the Angevine Lumber Company on the Stave River, 30 miles east of Vancouver. The timber will be marketed on the lower Fraser.

The city of Vancouver is considering an offer from the Hofius Estate and Mr. M. Thompson, of Seattle, to sell to the city the timber limits on Seymour Creek for \$1.50 per thousand feet. The estimated stand is 142,000,000 feet.

The sawmill belonging to the Valley City Lumber Company, forty miles west of Red Deer, Alta., was completely destroyed by fire recently. The mill was situated west of Leslieville, near the Rocky Mountain House. The plant was practically a new one, and the loss is only partially covered by insurance. W. H. Cushing is president of the company. It is not yet known whether the company will rebuild at once.

The Thos. Davidson Manufacturing Company, Limited, has secured an extra-provincial license to carry on business in British Columbia, with provincial head office at 901 Metropolitan Building, 837 Hastings St. West, Vancouver, B.C. The head office of the company is 187 Delisle Street, Montreal. The capital stock is \$5,000,000. The powers of the company include carrying on business as manufacturers and dealers in timber, wood, etc.

Negotiations are under way which are expected to lead to the re-opening of the large sawmill at Port Hammond, B.C. A Vancouver firm is reported to be considering a proposition for the purchase and operation of the plant.

The Western Pine Lumber Company, Limited, whose sawmill is located on Smelter Lake near Grand Forks, B.C., are preparing to take out 9,000,000 feet of logs during the coming winter. The company's camps are on Lynch Creek, a tributary of the North Fork of the Kettle River.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

472. **Rock elm.**—A Liverpool firm of wood brokers would like to get into touch with Canadian shippers of rock elm.

474. **Staves.**—A wine distiller in France wishes to purchase oak staves for barrels, not sawn preferably, delivered in Bordeaux or Marseilles.

The Penetanguishene Planing Mill

Mr. Alphonse Tessier, proprietor of the Penetanguishene Planing Mill, Sash & Door Factory, whose advertisement appears in another column, has replaced the mill which was burnt last year, with a modern cement building, equipped with up-to-date machinery and is now in a position to take care of all classes of planing mill work. Railway switches direct to mill enable Mr. Tessier to specialize in planing by the carload. In addition to the planing mill, Mr. Tessier owns an extensive limit several miles from Penetanguishene, as well as a saw mill on the property.

The Partington Pulp & Paper Company will carry on lumber operations on the Nashwaak river during the coming winter. The impression has been quite general that the company might not carry on any operations on the Nashwaak during the coming season as a result of their entire cut last year being hung up in the spring. Hon. N. M. Jones, manager of the company's business, says:—"We will carry on operations on the Nashwaak during the coming season, but I cannot state the quantity of lumber we will cut at this time, as we have not completed our cruising. The cut will not be as large as last year on the Nashwaak, but we will cut the usual quantity on the Bartholomew river for our sawmill at Blackville."

A good time for Hoo-Hoo in Eastern Canada is promised by R. H. Webb, Vicegerent Snark, who is getting ready for a concatenation at Toronto some time in the latter half of October. Those who know the whereabouts of any blind kittens should tie them up safely until the concat comes off.

Scandinavia

For conveying shavings and other materials Scandinavia will pay you dividends in long and efficient service for every dollar invested. It will pay you to try our special Scandinavia belt made for this purpose.

Write for information and prices.

Write for Book of
Belting Information
The Main Drive

The Ideal Conveyor Belt

Scandinavia can be used in wet places and for outside drives. It is made from the highest grade long fibre cotton, the yarns being woven as tightly as it is possible to weave them. After thorough stretching it is treated with bituminous filling—the result being a belt of unsurpassed strength, durability and uniformity of structure.

When
You
Overhaul
Install

GOODHUE BELTS

“Acme Waterproof” Leather Belting

This brand is especially well suited to the wet places in a saw or pulp mill and will run true as long as it is in service. When you are overhauling your mill equip it with “Goodhue Belts” and you will never regret it. They are honestly made of solid leather—every inch a good belt and they won’t stretch.

Manufacturers of
Patented Steel Roller Bearings, Sawmill Carriages;
Steel Band Mills, Portable and Stationary,
for 16 to 19 Gauge Saws; Automatic
Filing Machines (Swages)

by using our

Patent Steel Band Mill and Carriage

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Newburgh, Ontario

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank; or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

Are your horses of use to you?

This seems an absurd question—and the answer is always
"Of course they are"—In which case provide your stables with:

Johnson's Reliable Veterinary Remedies

Johnson's Horse Liniment, No. 1 (Alcoholic)

1 gal. jugs (Imperial)	\$4.50 gal.
1 lb. bottles	8.00 doz.
2 lb. bottles	15.00 doz.

Johnson's Horse Liniment, No. 2 (an oil liniment)

1 gal. jugs (Imperial)	3.00 gal.
1 lb. bottles	6.00 doz.
2 lb. bottles	11.00 doz.

Johnson's Horse Colic Remedy

A sure and speedy cure for all kinds of Colic	
1 gal. jugs (Imperial) 40 doses	5.00 gal.
1 lb. bottles 4 doses	8.00 doz.
2 lb. bottles 8 doses	15.00 doz.

Johnson's Veterinary Healing Ointment (Gall Cure)

2 lb. tins	2.00 per tin
4 oz. tins	3.50 doz.

Johnson's Condition Powders (Concentrated)

1 lb. Packages	3.60 per doz.
----------------	---------------

Johnson's Camp and Household Remedies, such as Cough Syrup, Healing Ointment, Headache Powders, Big 4 Liniment, Stomach Bitters, Cathartic Pills, etc., etc., have stood the test of twenty-five years and are in use all over Canada, from the Atlantic to the Pacific. Prices are lower than those of all other manufacturers. Letter orders receive prompt attention.

Good Lumber HORSES

Should be free from all blemishes

Use

ABSORBINE

for Wind Puff, Capped Elbow, Bog Spavin, Thoroughpin, Shoe Boil, Curb, Enlarged Glands and all puffs and swellings, Fistula, Poll Evil, Sprains, Contracted Tendons, Bruises, Lameness of all kinds.

ANTISEPTIC

You cannot get good work out of your lumber horses if they are lame, blemished, sore, sick or similarly unfit. The animal with Swellings, Soft Bunches, Bog Spavins or any such blemish, whether lame or not, needs your attention.

ABSORBINE

is your own and your horse's best friend—it relieves the horse of all pain, soreness and troublesome blemish. It makes the horse better looking, better working, more fit and of greater value to you.

You can work your horse at the same time. This is no new lotion but the tried and tested remedy of many years successful use.

Thousands upon thousands of horses which would have been ailing and sick and unsightly have been made fit and well—good workers and good lookers. What others have done with Absorbine you can do, too.

All enquiries on special cases answered without delay—full information and instruction on request.

Absorbine \$2.00 a bottle at druggists or delivered.

Manufactured only by

ABSORBINE

does not blister or remove the hair, never leaves scars or blemishes of any kind.

It is easy to apply and does not require the horse to be laid up.

Highly concentrated and only a few drops required at each application.

One of the Best Opportunities in Canada for Practical Lumbermen with Moderate Capital

We have a Saw Mill operated by water power, capacity about 40,000 feet B.M. per day of 10 hours, and two hundred and fifty million feet of standing timber, mostly fir and cedar, located in the interior of British Columbia on the Arrow Lakes, twelve miles from Arrowhead. Also car barge and tugs. Will sell the entire layout at a reasonable figure with moderate cash payment and fifteen annual payments for balance with six per cent. interest, or will lease the Mill including barge and tugs for long term on basis of annual rental, or will contract at a price per thousand for logging, manufacturing and loading on cars.

This is an exceptional opportunity for practical lumbermen with small capital to secure a going lumber manufacturing business on long terms.

The Shimer Cutter Heads For Door and Sash Work

These Heads are designed especially to meet the requirements of Door and Sash makers—to save all the hand fitting. The shape of the mould desired is turned into the Circular Bits, guaranteeing a uniform pattern, and that there will be no trouble in framing door and sash parts when matched with Shimer Cutter Heads. Prices are as follows:

Door Head in solid section, complete with Bits to work 1 to 1 1/4 in. Doors.	\$18.63
Door Head with Expansion feature complete, extra	2.60
Bits for heavier doors \$7.28 to \$9.36 per set.	
Sash Head in solid section, complete for 1 to 1 1/4-in. Sash	17.91
Sash Head with Expansion feature complete, extra	2.60
Bits for heavier sash \$7.00 to \$7.66 per set.	
Cope Heads without Bits, each	6.45
Cope Bits moulded to pattern, \$1.43 to \$1.56 each.	

If you wish to reduce running expenses it will pay you to study the advantages offered by the Shimer Cutter Heads. There is nothing like them for strength—for Reliability—for Fast Cutting—for Quick Adjustment—for all-round work and lasting qualities.

These tools are turned out of Solid Steel Forgings—have the Shimer "make-ready" which saves you all the fitting and trying—keep your work up to the standard.

WHY you should install the Mahony Blower System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses 1/4 less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant.

Actual Results That Are Convincing Read What "FAY-EGAN "LIGHTNING" 275's Are Doing

Note particularly our No. 275 is a medium weight and medium priced machine. Pressure bars adjust for over-swinging cutters, so that it can be used as an Inside Molder. Both cylinders double belted inside double-gear drive. Round heads with jointers, setters and grinders.

HEAVY WORK IN LOUISIANA

"We have dressed as large as 6 x 8-inch on your No. 275 16-inch Matcher and must say it has in every way met our approval. It gives us pleasure to recommend it. H. E. Buck Lumber Co., Lake Charles, La."

WORK THAT TESTS ANY MATCHER IN MICHIGAN

"We use your No. 275 on a variety of work, running from $\frac{1}{4}$ to $1\frac{1}{2}$ -inch soft wood to $3\frac{5}{8}$ x $10\frac{1}{2}$ inch oak and $4\frac{1}{2}$ x $6\frac{5}{8}$ inch hickory. We plane all this stock on four sides, sometimes taking a $\frac{1}{2}$ -inch cut with the side heads on oak $3\frac{5}{8}$ inch thick. A large part of our work is planing and matching circular tank staves $1\frac{1}{4}$ x 4 inch. Machine has greater capacity than our men. We are entirely satisfied.

Rumely Products Company, Battle Creek, Mich."

FAST WORK ON ROOFERS IN NORTH CAROLINA

"Actual book records show we put 8,100,630 feet of roofers averaging 1 x 7 inch through a No. 275 24-inch Matcher in 1911.

W. B. Gettys Lumber Company, Zebulon, N.C."

A VARIETY OF WORK IN GEORGIA

"We work all sorts of stock from $\frac{1}{2}$ inch ceiling to sizing 16 x 8 inch. In my 25 years' experience I have never seen its equal for the amount of work it will turn out. It has the most wonderful feed for its size and has not cost us a cent for repairs.

Shaw Bros. Company, Macon, Ga."

"Proof of the pudding is the eating"—these results can be verified or we'll send bulletin illustrating and describing the No. 275 in detail and tell you where you can see one in operation nearby.

Shows Over \$1800 Annual Saving

Before covering the steam pipes of their Central Power Plant with J-M Asbesto-Sponge Felted Pipe Covering, the Elkins Coal & Coke Co., Morgantown, W. Va., claim that the fuel consumed by the boilers in operating their plant cost them 4.4 cents for every ton of coal mined. A careful check by them after J-M Covering was installed showed that the fuel consumed in mining a ton of coal cost but 3.1 cents per ton, or a saving of 1.3 cents per ton on every ton mined. On this basis J-M Asbesto-Sponge Felted Covering saves them over \$1,843.00 per year.

This is but one of many similar tests, showing that a great saving in fuel can be effected by covering steam pipes with

J-M ASBESTO-SPONGE FELTED PIPE COVERING

The secret of the remarkable insulating value of this covering lies in its construction. It is made of many layers of strong felt, composed of the best quality asbestos fibre, and fine particles of sponge, formed like the leaves of a book (see illustration), and confines such a vast amount of dead air that its insulating efficiency is almost 100 per cent.

Pipes insulated with J-M Asbesto-Sponge Felted Covering will carry steam over a mile with practically no loss. And unlike ordinary pipe coverings, vibration and rough usage will not cause it to crack, break or crumble, and thereby lose its insulating value. For durability and long service it is unequalled. Has been found in perfect condition after more than fifteen years' service on underground pipes.

The up-to-date mill or factory bases its equipment first, upon efficiency; second, upon economy. Anything which combines both of these comprises the highest type of modern outfit.

DISSTON Inserted Tooth Circular Saws

while higher in first cost are the cheapest in the long run.

They have these advantages:

Not necessary to buy a larger saw than required at the start, for it always retains original diameter; seldom needs hammering; no gumming; only tool required to keep in order is a file. Can be pointed or sharpened in a few minutes. Damage to teeth can be quickly repaired by merely inserting new teeth.

Owing to angle at which teeth strike wood, and ample gullet room for taking care of sawdust, the Chisel Point Saw also requires less power to drive at a given rate of feed, through a cut of a given thickness, than any other pattern of saw.

All F.O.B. Jamestown, New York.

Yes Sir! Cling-Surface is unequalled for rope treatment. Here is proof.

These illustrations show two ropes in the plant of the Crystal Ice & Storage Co., Buffalo, N.Y., that have been typically benefitted by Cling-Surface treatment. Ernest J. Lancey, Chief Engineer, has this to say:

"Cling-Surface has done these ropes much good by not only preventing slip with less tension, but by keeping them pliable, waterproof, and keeping all the fibres lubricated, which reduces the internal friction and outside wear. We recently installed a new rope, and intend to start right with Cling-Surface. We get best results applying the Cling-Surface

as the rope enters the sheave on the tension carriage."

Cling-Surface is of as great value for ropes as it is for belts. It acts for ropes much as it does for a porous belt, gradually penetrates all through, keeping the whole rope pliable and in best physical condition. Cling-Surface makes each fiber slide smoothly against its neighbors, which is better than the dry internal grinding and chafing that occurs without Cling-Surface treatment, and is so destructive.

If you have a difficult drive on which other methods of preventing slip have failed and on which you would like to try Cling-Surface, let us know. Write today and get details. We will be glad to quote f.o.b. Toronto.

RUBBER GOODS FOR LUMBERMEN

Belting Our long experience in the making of Rubber Belts enables us to specialize on this line. "Monarch," "Red Strip" and "Lion" are our leading brands for power transmission. (Write for Booklet B-1.)

Packings "Redstone" High Pressure Sheet Packing has proved by test that it will outlast any other similar packing on the market. We make Spiral and Ring Packings, etc., that are equally reliable. (Booklet P-1.)

Hose for Steam, Water, etc., etc., in various grades, made especially to give satisfactory and economical service under different conditions. (Booklet H-1.)

Fire Hose One or more of our twenty brands of Fire Hose will be found, not only in the best equipped Factories, Mills, etc., but in almost every Fire Department in the Dominion. (Booklet H-1.)

Two Factors With Which You Are Familiar Regulate Timber Values

Supply—it cannot increase during the life of this generation.

Demand—for wood and wood products will not decrease during the life of this generation, if ever.

Caught between these two forces which are moving toward each other steadily, timber values literally are being

Shoved Up

by the pressure behind them.

For these reasons timber is a good investment whether bought for present or future operation or as an investment.

Timber now is being offered at prices which will make your investment profitable, not in many years but a few years.

You are entitled to information about timber bargains. Ask for it.

"Dunbar" Clapboard Machine

Here is a machine that will make clapboards out of lumber that cannot be profitably manufactured into anything else. It is guaranteed to take from 15% to 20% more out of the same lumber than the old style machine. Capacity from 5000 to 7000 per day according to quality of lumber.

It will pay you to get our particulars

Maritime Foundry & Machine Wks.

Chatham, Limited New Brunswick

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited
ORILLIA, ONT.

THESE HEADBLOCKS WILL WEAR

They are of new design, gotten up specially to withstand the jarring of heavy niggers, and they will stand the strain of the hardest work.

About twenty of them have been tested in mills all over the country since the beginning of the present sawing season, being thoroughly tried out.

The service they have given marks them as great headblocks well worth your while to investigate. May we send particulars?

William Hamilton Company
Peterborough, Ontario

The Spartan Warriors

of old were the pioneers of the Greek fighting world and were trained from their youth to resist hunger and exposure to extreme hardships.

SPARTAN LEATHER BELTING

is made to resist those elements which would otherwise shorten its term of usefulness. It is absolutely proof against the ordinary curses of beltdom—heat, friction, water, steam, oil and acid fumes—that we guarantee and furthermore that a Spartan belt will last longer, give better service and with greater economy than other belting working under the same conditions.

Send for Spartan Book and further particulars.

BUILT FROM EXPERIENCE

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service and often in localities where repairs cannot be made without great inconvenience.

When you want a locomotive you cannot afford to overlook the experience of this company.

Experience in building large locomotives is invaluable in connection with the design of smaller ones in order to insure reliability which is the main question in logging work. You know what delays cost you.

MONTREAL LOCOMOTIVE WORKS, LTD.

Dominion Express Building, MONTREAL, CANADA

OLD JERRY'S
PROTECTIVE
PAINT TALKS
NO. 2

A Better Day's Work

"It's rough enough on the brushes," remarked Jerry, "when you're usin' ordinary paint an' pushin' 'em against iron and steel but, believe me, it's rougher yet on the painter.

"We get it easy though now and then when the boss is handed a specification for graphite paint. Graphite's the slickest thing I know about—spreads easy and leaves your arm fellin' fine after a day's work.

"Any graphite looks good to us but the owner don't get a square deal when it's anything but Dixon's Silica-Graphite Paint. It's the silica that stiffens up the flake graphite an' makes the paint that "wears like iron".

41 FT. STEEL PLATE SAWDUST
CONVEYOR BUILT FOR THE
CROW'S NEST PASS LUMBER CO.,
WARDNER, B.C.

STEEL PLATE WORK

TO make a success of building Steel Plate Work, in which practically every job is entirely new and of special design, it is absolutely essential that everyone connected with it—from the designing engineer to the boiler-maker—is up-to-the-minute in his particular field, and further, has more than a little practical experience to back him up.

It is the kind of work that tests out a boiler shop. WE MAKE A SPECIALTY OF IT.

At present we are getting out a catalogue of 24 pages showing some of the difficult jobs we have handled in the last few years.

The 1911 extensions to our shops have placed us in a better position than ever before to do this special work. Our facilities in every department have materially increased—we have the men, the equipment and the experience—and for this reason we are going after this kind of work instead of waiting for it to be put up to us.

We attach a list of plate work that we are turning out every day. If you are interested in getting anything along similar lines, send us your sketch, and we will be glad to quote.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |
| | POWER PLANT |
| | 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| | 2 Double Duplex, high pressure Water Pumps. |
| | 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| | 2 125 h.p. Water Wheels. |
| | 1 Upright Engine for sawdust conveyor. |
| | 1 10 h.p. Engine. |
| | 1 Mitts & Merrell Hog. |
| | 1 Wood Machine for 22-in. wood. |
| | 1 Wood Machine for 16-in. wood. |
| | 1 Edger for ripping dry lumber, installed. |
| | 1 Edger for ripping dry lumber, not installed. |
| | 1 30 h.p. Generator, 250 volt. |
| | 1 30 light arc generator. |

FILING ROOM

- 1 Automatic Filing Machine for 12-in. D.C. band saws.
1 Automatic Grinding Machine for 8-in. S.C. band saws.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9' wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. **Brazel Plows** cut 6" wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fills up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12' of loose snow each time the plow passes over.

Our Double Band Mill, Huttig, Ark.

Why We Can Give "Value Received"

We Own one hundred thousand acres of the best virgin Southern Hardwood timber.

We Operate large band mills at Huttig, Ark., and Deering, Mo.

We Cut Forty Million feet of hardwoods annually and carry 15,000,000 feet in stock.

We Sell only stock cut on our own mills and so can **GUARANTEE** the quality of every shipment.

We Ship high grades that increase the size and percentage of your cuttings, reduce factory costs and shrink the waste pile. Therefore:

We Can save you money on every shipment of oak, ash, gum, elm, cypress, tupelo, hickory, cottonwood, sycamore, soft maple and dimension.

Let us prove this on your next order.

GOODYEAR

WHAT MAKES *WEAR* IN A HOSE?

HARD, satisfactory service—or wear—can only be got from hose that is *properly* made from carefully selected materials.

Goodyear hose-making machines are thoroughly modern. No process has yet been evolved that could build better service into hose.

The rubber and cotton used are both tested for strength and purity. The fabric is specially woven from hard, long-fibre cotton. It is cut on the bias to effectually resist expansion, elongation or bursting under pressure.

The same thorough methods that have made famous the Goodyear Rubber Belt are followed in Goodyear Hose Manufacture. Rubber is forced under hydraulic pressure into the cotton fabric, which is then, layer on layer, machine rolled into an impenetrable and inseparable tube of rubber and duck.

GOODYEAR SUCTION HOSE

Goodyear Suction Hose is made in many styles and in smooth or rough bore. When we understand for what purpose the hose is to be used, we supply the kind that will give the best and longest service.

The smooth bore hose is reinforced by a galvanized iron coil entirely imbedded in the wall of the hose. Water or other liquids cannot reach it. The inner wall is smooth. This lessens the friction resistance to the flow and saves power.

For oils, acids, salt water, etc., that would ruin ordinary hose, we make a smooth bore hose with special oil and acid resisting lining. Special smooth bore hose is made for dredging, wrecking, etc.

For Contractors, Mills and Factories—anywhere where water or non-injurious liquids have to be pumped—we would in most cases recommend our rough bore Suction Hose—strong non-collapsible hose built around galvanized steel coils.

GOODYEAR AIR HOSE

With fair usage Goodyear Air Hose will be found proof against internal decay from oil—breaking away of pieces of the tube—and clogging of the machinery. The lining is made from selected rubber and cured to prevent hardening from the heat and pressure.

Goodyear Air Hose will give good service under intermittent pressure.

In mines, engine and boiler works, steel construction contracts—wherever pneumatic tools are being operated you will find Goodyear Air Hose. Wire or marline winding or marline jacket.

**GOODYEAR RUBBER
HOSE**

The opinion of men who have made a study of every condition that can ruin hose, and have found the remedy, is yours for the asking. When you order, tell us how you are going to use the hose. We can make suggestions that will save you money.

"Underwriters" MILL HOSE

We make a special fire-hose for factory use that is built to meet the specifications of the Associated Factory Mutual Fire Insurance Companies.

This is the GOODYEAR "UNDERWRITERS" FIRE HOSE.

Each 50 foot length is tested to 200 pounds pressure and branded to that effect. The inner tube is of the highest grade NEW rubber, of uniform thickness and quality. It will give long service without hardening or cracking. The fabric is made rot and mildew proof by antiseptic treatment.

To get low insurance rates—to get long and effective service from your Mill Hose—specify Goodyear "Underwriters" This hose because of its strength and reliability cannot be excelled for mill and factory use.

GOODYEAR STEAM HOSE

This hose is highly esteemed by practical men. Goodyear Steam Hose is made for extra hard service. It is lined with a special heat and oil resisting seamless tube.

Goodyear Steam Hose is a reliable hose under high pressures of steam or hot water. Don't take chances by using inferior hose for steam. Have Goodyear—it is made for high pressure from carefully tested materials. The inner lining is of a special rubber composition which resists the action of heat. It keeps the extreme heat from the frictioned fabric. This is what makes Goodyear Steam Hose durable.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Successful Slash Burning in B. C.

The burning of slash after logging operations is one of the most important means for the prevention of forest fires that have ever been devised. The British Columbia Forest Branch, realizing this, are doing all in its power to persuade loggers to adopt this principle, and has already met with much success. Following up the policy they recently addressed a letter to all British Columbia loggers urging them to make a special effort before the rainy season commences, to burn over any areas of dangerous slash resulting from this or previous years' logging operations on their timber lands. During last spring, nearly 15,000 acres of logging slash were burned over by coast operators, with entire success, and no loss to merchantable timber, and at a cost hardly more than nominal.

The conditions are now ideal for slash burning and the government hopes that advantage of such conditions will be taken by every operator, and all remaining slash areas burned over. If all the old slash can be burned over in this way and a policy of burning slash twice each year adopted, the slash will always be kept down to very limited areas which can be disposed of cheaply and without serious danger. Operators are also being asked to have a record kept of the area of slash burned over this fall and the cost of burning.

The rules concerning slash burning in British Columbia are as follows:—

1. Always construct a trail or a light fire-break around the slashed area before starting fires. This will serve to confine the fire and also permit men to get around the fire quickly.

2. Be sure and have enough men on hand when you start a fire to control the fire if it threatens to spread beyond the slash.

3. Never start a fire in the morning unless you feel certain a strong wind will not arise. The best time to start a fire is after 4

o'clock in the afternoon on a calm day; if the weather is warm and the slash dry all the better.

4. If the slash area is surrounded by timber, start fires first on the leeward side if there is a breeze, or on the uphill side if on a slope. When the danger of fire spreading beyond the area to be burned is past, set fire on the windward side or at the base of the slope; also whenever possible take advantage of a breeze blowing away from green timber.

5. Burn over the area as quickly as possible. This can be done by starting fires in a large number of places.

6. Keep a watchman on the area burned until all fires are out. Cut down any snags which may be burning.

St. John Strikers Return to Work

The expected has come to pass in St. John, N.B., and the striking mill workers who have held out during the past three months against the sawmill owners have at last decided to return to work. While there is much to be regretted in connection with this strike; because of the loss of wages to the men and the expense which the strike has brought upon the sawmill owners on account of the idleness of their mills, to say nothing of the high cost of lumber in the local markets; the result will not be altogether an unmixed evil, if it shows the mill men that they must exercise reason in their demands for increased pay and less arduous working conditions. If there is a fair element of reason in the demands of strikers they run a good chance of succeeding, at least partially. It is a foregone conclusion however, that when a strike is brought on during business depression, there is little chance of it resulting in favor of the strikers. Strikes inaugurated during a time of good business are frequently successful if they are based upon unreasonable grounds.

It was practically certain from the out-set that the late strike at St. John could not succeed. It came at a time when the manufacturers were feeling the depression of a falling demand and the strain of severe competition and high freight rates. So great had these become that business was in a really bad way for the time being and if the mills had continued running at their usual rate there might have been a great surplus of stock before the season was over. As a matter of fact it was to some extent a fortunate thing that the mills were obliged to shut down. A large amount of business was neglected, but much of that business might have been done at a loss either to the mill owners or to the people who purchased stocks at an earlier date when prices were high. Sawmill owners were therefore not sorry, that, if a strike had to be faced at all, it should have been at a time when there was a danger of dropping prices.

With trade conditions as they were, the sawmill owners were able to present a combined front to the strikers and to wait patiently until the latter changed their minds. Many of the strikers were influenced when returning to work, by the fact that in prolonging the strike they were reducing the amount of operations that would be carried on in the woods during the coming winter, where some of them would find their winter employment. A reduction of the cut in the woods would also mean a reduction of the cut at the mills next summer, resulting in permanent loss of employment to a large number of the strikers. As the season advanced therefore, and there was no sign of giving in, on the part of the mill owners, the situation of the strikers became serious and it was only a matter of time before they would be forced to call off the strike.

These were the simple economic forces which combined to end the strike. The matter was not fought out on the question of wages or hours at all. Had these been really at issue and the claims of the men well-founded, they might have run some chance of winning, but in the face of a declining market, even such conditions, had they been present, would scarcely have brought victory to the men. In fact, the strike was a most ill-timed one from the point of view of the men. It has resulted in a great loss to them and has shown the sawmill owners their strength. As a lesson to the strikers it may be of some value, although in the past, similar lessons have been of little effect, as the desire to strike seems to crop up periodically among St. John mill workers, irrespective of prevailing business conditions. The re-

sult of the strike can be summed up therefore as a great loss to the employees, a considerable loss to the employers, and a great reduction in the output of the mills at St. John this year, as well as a re-

duced cut in the woods during the coming winter. The cut at the St. John mills this year will be about 50,000,000 feet less than it would otherwise have been.

Northern Ontario's Timber Resources

An interesting letter appears elsewhere in this issue, written by a man who has lived for several years in the woods of Northern Ontario and is closely in touch with the actual conditions of the Northland. Only one or two points are brought out in this letter, but they are of much importance to the people of the north and of interest to the lumbering and pulp and paper making industries. In the first place, the writer refers to the value of the timber resources of the north and refutes, from his own knowledge, claims which have been made occasionally of late that the timber resources of the Northland have been badly over-estimated. He does not claim that in New Ontario there is such a growth of splendid timber as covered the older parts of the province. He simply asserts, from his own observation, that the timber resources are important, that they mean a great deal to the people of the north in the way of attracting capital to the country and they are sufficient to involve the expenditure of large amounts of money for many years to come, upon the employment of labor. As proof of this he cites the two cases with which readers of the Canada Lumberman are already familiar; the operations of Messrs. Jackson and Tindle on the Mettagami River and those of the Abitibi Pulp and Paper Company at Iroquois Falls. These two companies have invested large sums of money on enterprises which involve the employment of labor on a large scale and which also give to the settlers in the country a market for their pulpwood and for their agricultural output.

It is this latter feature which is of most importance to the settlers and by which the value of the timber resources will be largely judged during the early days of settlement. A good market for pulpwood means bread and butter for the settler and immediate command of money with which to do his pioneering work. The writer of the letter does not draw a very encouraging picture, however, in this connection. He points out that a great deal of mistaken opinion prevails regarding the value of the settler's pulpwood; that he is in fact, as a rule, scarcely able to cover the expense of cutting and hauling the pulpwood. Many men in the north who have no idea of becoming farmers have overlooked this fact and have purchased land, expecting to make money out of the pulpwood. The conditions, as out-

lined in this letter, point to the improbability of such men making anything from their land unless they hold it for a number of years, or unless some unexpected circumstances arise to give it exceptional value. The settler in northern Ontario has in fact to work very hard in order to make a success of his enterprise. He has some advantages which his forerunner in the older parts of the province had not, but he has many difficult problems to face. His work will be made all the more difficult if he is led to believe that he can make a fortune out of his pulpwood before commencing work upon his farm. It is unfortunate that this idea got abroad at all, but it did so, and in older Ontario it is still a common thing to hear people say that the settlers of the north have an easy thing as compared with the settlers in Southern Ontario in the early days. The sooner the people of old and new Ontario realize that they cannot expect to more than cover the cost of clearing and hauling their pulpwood, with perhaps a very small profit, the better it will be for all concerned.

Even under these circumstances the settler has an advantage in his pulpwood, inasmuch as it costs him practically nothing to clear his land. The settler in older Ontario had to clear his land at much expense both of labor and time and then he had to get rid of the accumulation of timber, probably by burning it. The timber was not, in the great majority of cases, anything but a liability.

Other important matters are discussed in the letter, among them, the drawbacks involved by the poor railway facilities now available, which fortunately will soon be improved, also by the poor roadways, which unfortunately may not be improved to any important extent for many years to come. Taking it all in all, the settler of the new country to the north has a set of problems to face which will tax his ingenuity and his patience to the utmost. In the light of all that has been written and learned about this country it appears certain that the government will have its hands very full in looking after the interests of these settlers; seeing that they do not enter the country with absurd ideas about its timber resources and that they do not locate upon lands of no agricultural value. Letters such as the one which we publish in this issue, cannot fail to assist in spreading a true understanding of the situation.

United States Imports and Exports of Lumber

In view of the removal of the duty upon lumber entering the United States, it is interesting to note the imports for the month of July, 1913, and the seven months ending July, as reported in the monthly summary of Commerce and Finance issued by the Bureau of Foreign and Domestic Commerce at Washington. Total imports of wood and manufacturers of wood for the month of July, 1913, were valued at \$3,192,814. During the month of July, 1912, the total value was \$3,748,143. For the seven months ending July the imports of wood and manufacturers of wood were valued as follows, 1913, \$20,079,260; 1912, \$17,795,138; 1911, \$16,297,669.

During July, 1913, the imports of boards, planks, deals, and other sawed lumber from Canada were valued at \$1,606,471. During July, 1912, the total was \$1,982,960, showing a falling off during July, 1913, of about \$380,000, which may be accounted for both by the financial depression during the summer of the present year, and by the fact that the tariff revision was already making itself felt by a reluctance on the part of importers to make purchases until the tariff on lumber had been settled or removed. During the seven months ending with July the imports under this head from Canada were valued as follows, 1913, \$8,281,629; 1912, \$7,638,041; 1911, \$6,491,778. It is interesting to note that the imports from Canada during the seven months ending July, 1913, as compared with those of the similar

period in 1912 although valued at an increase of \$643,588 only showed an increase of 7,623,000 feet.

The imports of wood pulp from Canada during July, 1913, were valued at \$340,203, as compared with \$413,560 during July, 1912. During the seven months ending with July the imports of wood pulp were valued as follows:—1913, \$2,400,077; 1912, \$2,393,783; 1911, \$2,783,357. Although the imports for the seven months of 1913 were a little greater in value than during the corresponding period of 1912, the total was less by some 17,000,000 pounds.

Imports of pulpwood during July, 1913, amounted to 124,757 cords valued at \$882,159, as compared with 132,355 cords valued at \$898,636 during July, 1912. During the seven months ending with July the imports of pulpwood amounted to 611,572 cords valued at \$3,984,420 as compared with 515,841 cords valued at \$3,273,291 during the corresponding period of 1912 and 482,937 cords valued at \$2,969,549 during the corresponding period of 1911.

Imports of shingles during July, 1913, amounted to 41,364 pieces valued at \$106,440. During July, 1912, the imports of shingles amounted to 66,619,000 pieces valued at \$167,397. During the seven months ending with July the imports of shingles were as follows:—1913, 237,985,000 pieces valued at \$608,510; 1912, 242,377,000 pieces valued at \$591,541; 1911, 298,708,000 pieces valued at \$656,501. The imports

of lath during July were valued at \$189,706 in 1913 and \$208,148 in 1912. During the seven months ending July the imports of lath were valued as follows:—1913, \$858,958; 1912, \$697,634; 1911, \$801,358.

The exports of wood and manufacturers of wood from the United States during July, 1913, were valued at \$11,447,360, as compared with \$10,215,465 during July, 1912. During the seven months ending with July, United States exports of wood and manufactures of wood were valued as follows: 1913, \$71,872,904; 1912, \$60,776,247; 1911, \$57,860,327. The exports of yellow pine and white pine during the month of July, 1913, were valued at \$2,541,193, the quantity being 114,484,000 feet. During July, 1912, the exports of white and yellow pine were

valued at \$2,127,541, the quantity being 94,881,000 feet. The average value of white and yellow pine imported during July, 1913, was therefore \$22.19 and during July, 1912, \$22.42. During the seven months ending July, the exports of white and yellow pine were as follows:—1913, 771,115,000 feet valued at \$17,243,621; 1912, 678,820,000 feet valued at \$14,660,123.

The exports of doors, sash and blinds during July, 1913, showed a great falling off as compared with July, 1912, the value being, 1913, \$91,169; 1912, \$156,099. For the seven months, however, the total showed a steady increase, being as follows:—1913, \$922,042; 1912, \$762,131; 1911, \$533,856.

Editorial Short Lengths for Busy Readers

The Ontario Department of Lands, Forests and Mines is placing new fire warnings in the Northern woods. The old warnings with all their small print, were seldom read and were of little use. The new ones are of flaming red and bear such admonitions as "Be Careful With Fire," "If You See a Fire Put It Out," and "Put Your Camp Fire Out." Next year these notices are to be printed in various languages.

A despatch from Victoria, B.C., states that an arrangement is being made between the Provincial government, the Dominion government, and the B. C. Lumber and Shingle Manufacturers Association to have Douglas fir timber and lumber tested and standardized so as to assist manufacturers in selling their output profitably and to offset the advantage gained by yellow pine in eastern markets. The tests will probably be carried out in the McGill University Laboratory at Montreal.

During the next three or four years the Dominion Public Works Department expects to use in the neighborhood of 100,000,000 feet of timber in the construction of new dockyards, piers and other constructional works on the Atlantic and Pacific seaboard, and in order that the Canadian lumber industry may enjoy the benefits of this development work in the immediate, as well as in the remote future, Hon. Robert Rogers, Minister of Public Works, has given his assurance that in all the contract specifications only Canadian timber will be allowed.

As a result of negotiations which have taken place between the Canadian Government and Lloyds concerning the lowering of insurance rates for shipping on the St. Lawrence route, arrangements have been completed by the Canadian Government by means of which a more thorough and complete system of telegraphing the arrival and departure of vessels in the Maritime Provinces and Quebec shall immediately go into force. The Canadian Government has made these arrangements at the request of Lloyds, as a possible step towards the lowering of the excessive insurance rates on Canadian shipping on the St. Lawrence route. Hon. J. D. Hazen, Hon. Geo. E. Foster, and Hon. J. D. Reid discussed the question thoroughly with Lloyds on their visits to England during the past twelve months.

A prominent Canadian lumberman upon his return from a recent visit to New York reports that trade in all lines is hesitating to some extent on account of the doubtful financial situation. There is general uncertainty regarding the outcome of the new financial bill which President Wilson recently stated that he intends to force through immediately. Banks and large financial houses are in doubt as to what conditions they will have to face and so are not loaning money any more than they can help. As soon as this matter is settled they will have to accommodate themselves to the new order of things. Considerable interest is being shown in New York in connection with the prospective opening up of trade in Pacific Coast lumber after the opening of the Panama canal. Dealers apparently realize fully that western stock will go to the eastern States in large quantities, but, as yet, none of them are very anxious to be the first to make the

experiment of marketing this stock. If the freight rates on Pacific Coast stocks to the eastern States are as low as some manufacturers are expecting, it will make a great difference in the yellow pine situation and some large yellow pine manufacturers have already stated that such conditions would probably make it necessary for them to re-organize their companies and write off a good deal of their stock.

The passing of the new United States tariff, brings into effect an entirely new set of conditions in connection with the export trade of Canada in lumber. The exact situation, so far as the duties under the old and the new tariffs are concerned is shown in the accompanying table. The effect of the change remains to be seen, and views of every kind have been expressed regarding it. Whatever the result as to the details of the trade, everyone will be pleased with the opportunity now afforded, of bringing business back to normal conditions. The duties under the new and the old tariffs are as follows:

Article	Old Tariff	New Tariff
Timber, hewn, sided or squared, and round timber, per cubic foot	½c	Free
Sawed boards, planks, deals, planed and finished per M.	\$1.25 to \$2.75	Free
Pickets, palings, fence posts, clapboards, staves, shingle bolts, etc.	10%	Free
Laths, per thousand feet	20c	Free
Singles, per thousand	50c	Free
Railroad ties, telephone, trolley, electric light and telegraph poles, if cedar	10%	10%

Full support of the Alberta Government has been pledged to A. G. MacKay, member for Athabasca, author of the woodman's lien act submitted at the regular session of the provincial legislature of Alberta, which opened in the Parliament Buildings in Edmonton, on September 16th. The bill, which is to be enacted by the present legislature and will become effective immediately afterward, is designed to protect workmen. Mr. MacKay said that the act protects the workman in every possible way. The workman does not need to establish his right to a lien on the timber; it exists already, if the present bill becomes law. All the workman has to do is, within a certain time, to file his claim in a court of law setting out simply the amount owing and for what and a judge will decide his case. If the judge finds for the workman he will order the claim to be paid within eight days or the stock on which the lien exists will be ordered to be sold within 20 days and the proceeds paid into court for the satisfaction of the claim. The act covers "logs, timber, poles, ties, bolts, staves, posts, tanbark and wood," and when it speaks of "labor or services," it refers to cutting, skidding, felling, hauling, scaling, banking, driving, running, rafting or booming and "any work done by cooks, blacksmiths, artisans and others usually employed in connection therewith, whether performed by wage earners or others," in fact, everyone employed about the camp. The act is not designed in restraint of trade and the lien automatically ceases to exist unless the workman files his claim in the court within the period provided, which is usually thirty days after the services have been performed.

Waste Reduction—The Problem of Today

Actual Difficulties of the Sawmill Operator Clearly Discussed by an Experienced Lumberman—The Small Log and Its Problem

By Chas. Allen

In a previous article on the saving of waste in woods operations and sawmills, I recommended cutting regular stock logs down to 4 in. or 5 in. tops or else the "rescuing" of all small logs now left in the tops down to the same size, also the saving of all small logs felled by the road and skidway cutters, the cutting of all small trees left in such exposed position that they would be blown down, and the taking out of all skids in which there was useful wood.

I would go still further. On most timber properties there are many so-called thickets or stands of timber that has never grown to large size, although very old, and which, on account of the crowded condition, will never grow much larger unless opened up by thinning. There may be but few logs larger than 7 in. or 8 in. on top end in such a stand, but in most of them there is a large number of logs 5 in. top and up. This condition is very common in spruce country, and the general practice is to cut around these thickets of small timber, and never touch them. There may be places where such cutting would not pay, but such places are not common if the problem is grasped as it should be. I would thin them and give the remaining trees a chance to grow. Another cause of a lot of waste in logging is the jobbing or contract system.

The contractor cuts his trees into logs for "scale," as he is paid by the thousand, and would probably sit down hard on any advanced system of logging. Percentage of saleable output to the stump is not in his line. There are no doubt, many log jobbers who do their work well, but the great majority of men in that line of business look at but one thing—how much they can get to the "scalers" stick in the easiest way. They are not to be blamed. The operators squeeze them as closely as possible in letting out the jobs, and as it is not in human nature to consider the other fellow's interests first, they don't. That is all there is to it.

There may have been a time when the contract system of logging was all right, but I don't think that the workings of the past fifty years show any evidence of that condition. Go over old workings almost anywhere. Look over the ground that has been "cleaned up," and the story is told. A large part of this work was done by contract.

I don't attempt to claim that what was done by the operators themselves was perfect, but I am willing to state that where competent foremen were employed the amount of wood per stump was, in most cases, larger. It appeals to me that, unless the conditions are much out of the ordinary, it never pays to job your logging. The company whose staff is properly organized, can log cheaper than any contractor, and get more lumber per acre logged. If they can contract for less than they can do the work for themselves, there are a good many "loose spokes in their wheel." Stop and think. Giving some one a job to do their work on which he is going to make a profit. Why don't they do the work themselves at the same cost as the contractor does, and put the profits they pay to him, to their credit at the bank?

Sit down Mr. Manufacturer and think a few minutes. If you can't hire a man who can log as cheaply as the contractor can, why just hire the contractor. Is that not logic? You will then have control of your own stumpage, and you can stop this tearing up of things and get results per stump.

Just one more point to work out, and then we will "get out of the woods."

The Percentage of Lumber To Each Stump

How many general managers ever took the trouble to find out what their percentage of lumber per stump really was from year to year, or from camp to camp during the same year? It is of the utmost importance that the following items should be accurately known. Number of stumps, average diameter of stumps, number of feet of scaled lumber per stump (average).

With these data in hand you know where "you are at," and you have a good tight check on your foreman.

No manufacturer in any other line would dare to take such chances with his raw material as the lumberman does at the present time. The cotton or woollen mill man must know what results he gets per pound of cotton or wool (as the case may be), and if we are going to stop this awful waste of our raw material, we must get down to something like the same basis.

Don't think that I am advocating a line of procedure that will run up your costs. It is no trouble for your head log-makers to tally the size of the butt of the tree, hence you have the number of stumps, and size in one tally. No extra cost.

Practical advice on the only feasible method of getting fullest possible results out of a woods operation — A proposition which most lumbermen agree with, but few of them put into effect.

In making logs let the fellers go right ahead felling, and let the log makers keep on cutting up trees as fast as they are felled. Four men with the present complement of "swampers," get more logs per day than before, and more lumber per tree.

Result—Accurate record of work, more logs and more lumber per stump, hence less cost per thousand feet, and you know what you are doing in the log department all the time.

At this point you will want to know what additional quantity of lumber you will get from a given number of stumps, by taking out all the wood that is in every tree. So many things enter into this problem, that one answer would not be correct for many different operations. What is the size of the top of your present minimum log? What variety of trees are you cutting? What kind of growth is in your trees? Where is your location? All these things have a lot to do with a correct answer to this point.

Generally speaking the saving is anywhere from 6 per cent. to 12 per cent., depending to a large extent on the size of the minimum log you now take out. It will be obvious to anyone, that the larger your present minimum top is, the larger the percentage of saving will be, or in other words, the more wood you are now wasting the greater the saving will be.

It amounts to this—you must get at it on the spot. You cannot guess it.

Again. There is to a large extent no real relation in percentage of saving between a soft wood operation (spruce, white pine, hemlock), and a hardwood proposition (beech, birch, maple).

Further, each of these varieties of wood presents an entirely different problem from its neighbor.

As the hardwood problems are so different from the softwood I will not touch them at this time but will reserve what I have to say of them for another article.

When logs have to be moved long distances by "Booming Companies," as is the case on the St. John and some other rivers, the attitude of the movers towards these small logs would have to be taken into consideration. It might be that their ideas were such as to make it impossible to do anything with the "little fellows" in such cases.

So as not to confuse things we will discuss the small log, and what we will do with it, and leave the mill waste produced in sawing until later on.

Now as the "puffy" little portable that cuts 100 M. deals, scantling and boards (usually spruce in Eastern Canada), and the great band-saw and stock-gang mill that "chews" up 200 M. in ten hours, and uses a mixed lot of soft and hardwood logs, are both factors in this "waste pile," along with all their fellows of all degrees of size between the two extremes mentioned, the reader will see that it is something of an undertaking, in the limited scope of a trade paper article, to show these operators so widely separated as to conditions, capacity and equipment, just what each one should do with his small logs for best results.

If given any one operation, either large or small, with a full opportunity to examine all the conditions that have a bearing in the case, there would be no difficulty in a prompt working out of a paying solution of this small log problem, but with many thousand operations, and no conditions known, staring one in the face, an intelligent answer as to what to do with these logs, that will suit them all is out of the question.

How The Problem Works Out

In this dilemma I can see no other way out than to manufacture a few specimen operations as illustrations.

The little portable cutting spruce, usually has its log supply hauled to it on sleds, or "snaked" up, and as its logging is cheap, there is no reason in the world why they should leave anything in their trees that would make a good 4 in. top, as it would pay them to saw the small stuff into 3 in. x 3 in., 3 in. x 4 in., 3 in. x 6 in., which always brings 75 to 80 per cent. the price of deals. These portables cut all the way up to two millions of feet, and it is nothing but lack of thought, in many cases, on the part of the stumpage owner, that so little of the scantling is saved.

Many of these portable mills saw no lath, thus throwing away all their slabs and edgings. It might be argued, that the increased quantity of scantling that would be thrown on the market by these

mills, if they all made the saving, would knock the price down, but I do not see any real danger from this source, as the total quantity now cut by these mills is not formidable, and as the average saving thus made would not exceed 8 per cent. of the whole cut, it would not amount to very many millions of feet, so the upsetting of the markets of the world by such a quantity does not look very dangerous.

On the other hand, this scantling represents on an average \$11,000 per million feet to the manufacturer, and two or three million feet means a lot to the lumber industry when thought of in dollars and cents, and the further thought, that, whatever profit is made from its sale is a clear gain from the waste pile.

There are in the spruce country many mills that cut some three millions of feet annually, and I will try and work out a little illustration, with such an operation as the basis.

We will suppose that such a mill is equipped with either rotary, or band-saw, edger, and lath machine, and that the logs average twenty to the thousand feet, that the trees average ten to the thousand, and that they are cutting logs down to 12 ft. long and 8 in. top.

I think this about fills the bill on many small operations. The average now is two logs to the tree, and the average stump value is one hundred feet. The present number of logs in the drive is 60,000, and the number of trees cut is 30,000.

A Concrete Example

Now let us apply the more advanced, and saving method of logging, and cut down to 4 in. to 5 in. top in every case where it is possible. On a conservative estimate you will get an extra log (small of course) in fully one half of the tops now left, and the number of feet in that small log (average), will depend on the kind of growth your trees are. We will be conservative and say twelve feet, and that is a small average.

You will also pick up from one to two per cent. of your three million, by taking the road, skidway, and small exposed trees. Then your scale sheet will look something like this—Number of trees cut 30,000. Number of logs in drive 77,500, average number of logs to tree just over $2\frac{1}{2}$, total quantity of scaled lumber 3,210,000 feet, average stump value one hundred and seven feet.

This showing is about as low as it can be, and it is not uncommon to show results fully six per cent. better than this.

Let us examine this showing, and see how it looks. With the exception of a small number of exposed trees, we did not fell one extra tree, hence our felling costs are the same. We did not cut a foot more road, nor any additional skidways. We consumed no more stumpage, but in spite of these things we have 210,000 feet more logs.

What extra cost did we really go to? If you care to so figure it just 6 per cent. of the "cutting up" cost, but in reality, the better results obtained by "cutting up" trees by this method, offsets that 6 per cent. item. The rest of the costs consist in the horse work required to skid 210,000 feet, and the hauling costs on same quantity of river landing, or rail loading point as the case may be. If your regular log stock is costing you say five dollars at this point, these small logs are not costing you more than one half that amount. You thus cut down the average cost of all your logs, and yet have more lumber than before.

I am not trying to prove that you can get something for nothing. You don't get that anywhere in this big world, but I am contending that you can get more for your money than you are now getting, and make every acre of your timber holdings worth more to you than they are now.

Doesn't it appeal to you that, if we could save, not six to twelve per cent. of our present stumpage (easily possible), but just three per cent., that it would be one of the greatest gains along the line of conservation of our timber, yet accomplished? Am I right when I think that this, say, three per cent. saving, actually means adding three per cent. to our stumpage value? And if it adds three per cent. to the present value, what percentage does that mean in, say forty years, at the present increasing value of stumpage.

This easily made saving in the woods is worth an effort as a straight business proposition, and I am at a loss to know, why long-headed business men, with their money in timber stands, have allowed this wasteful policy to continue so long.

They are going to stop it some time, because they will have to do so. Why not at once?

As I have previously pointed out in these articles, it is now a matter of driving or rail costs, in order to determine the boom costs of the small log.

If you drive your own logs, or rail them to the mill, you can do it for about the same outlay as for any other logs, but if it should cost you a little more, they will stand it, as their bank or loading point cost, was much under regular stock.

And now comes the final stage. What will we saw the logs into,

to pay the most profit? Spruce offers you these choices—scantling, crating, staves, pickets or palings, with laths from the slabs.

You will say that you can't saw this small stuff to advantage in the mill I have described, and if your mill is equipped for heavy and rapid sawing you can't, and that is all there is to it. If you are going to saw small logs, you must do it with machines that are suited to the work. Many mill men have made a try at small logs on big log machines, and had to give it up. They were at the old experiment, of "trying to fit a round plug in a square hole."

If the mill I described will put in a twin-slabber, and an automatic set, friction feed, ricker or sawing machine, neither of which costs so very much, then they can saw these small logs into scantling, crating or pickets in jig time at low cost.

Just run your small log through the "twin-slabber," and bring it to a 4 in. "cant," then give it to your edger and it is in 2 x 4 in., 3 x 4 in., or 4 x 6 in., (or any size scantling that a 4 in. "cant" will make) in two forward motions.

Trim it and it is done. You can saw in this way for less than \$1.50 per thousand. Send the slabs to the lath machine, and you have cleaned up the dreaded small log in a smooth manner.

All your small logs will not suit for scantling. Then cut them the right length on a cut-off saw, give them to the ricker, and in a few minutes you will see some nice bundles of crating or pickets (which ever you desire) going out to be piled. Staves pay well in many sections, but I could not advise on that point unless I knew the location. Scantling and crating sell everywhere, and so as not to flood the market with it, see to it that you cut no larger total quantity small logs included, than you have been cutting for your market right along.

These small logs are no trouble to handle, and you will get more actual profit per thousand from them, than from your regular stocks. I will take up other woods than spruce in later articles.

[Editor's Note:—Mr. Allen's articles, on the saving of waste, deal in a refreshingly vigorous manner with a problem which is as old as the lumbering industry, but which still remains unsolved, so far as general practice is concerned. In a letter to the Editor Mr. Allen refers to his first article as follows:—"I think my suggestion to put a trained man in charge of this waste is the only solution. You put a bookkeeper in charge of books, why not a waste man in charge of by-products, as it were. His raw material would be what the woods and mill now waste and his part in the business would be to get a profit out of his raw material. It is simply a straight business proposition. . . . We are cutting too much per year to have our forests last many more years. We are leaving behind in the slashings several fortunes each year. In spite of all our talk about conservation we are doing but little and we can never hope to do much to conserve our timber resources until we make it popular with owners, directors, and managers by making it a paying business proposition. The big busy business man can grasp something of that kind and will push it for all it is worth, but he has no time to bother with theory or schemes that must be tried a hundred years before you can find out whether they will give a return on the capital or not."]

Dynamite Stops Forest Fires

The use of dynamite in stopping forest fires may become general as a result of recent experiments made before the Society of Eastern Foresters at Wanakena, N.Y. In an old lumber slash piled with debris, which had once been run over by fire, dynamite cartridges were placed in the ground for a distance of over 250 feet, spaced about two feet apart and set by making a hole, by hand, with a crow-bar and putting in the cartridge, then tamping with earth rammed down with a piece of broomstick. The depth of the holes was about 15 to 18 inches. It took about an hour to set the cartridges. The slash and ground were then sprinkled with kerosene oil from watering cans and set on fire. As the flames reached the line of dynamite, the latter was exploded by electricity, and when the smoke had cleared away the fire was found to be stopped by a trench about three feet wide and nearly three feet deep, blown right down into the mineral soil, and leaving the soil so loose that, had it been necessary, earth and sand in any quantity was available for throwing on the fire. Dead and down logs and stumps were blown out of the way. For all but a very bad top fire this method would have proved eminently satisfactory for stopping it and by going sufficiently far ahead of a forest fire and laying dynamite the fire could either be completely stopped or could be narrowed down very quickly, cheaply and surely. Experiments were tried by laying the dynamite on top of the ground, but the results were without value.

British Columbia runs Ontario a close second for leadership for the largest lumber production of the Canadian provinces. Ontario has always led, but this year it has a percentage of the total cut of 31.6, while British Columbia's is 29.9. The total value of lumber products of the Dominion in 1912 amounted to \$76,540,897, all the provinces showing a falling off in production, with the exception of Saskatchewan.

The Reader's Viewpoint on Trade Topics

Opinions on Questions of General Interest—Hemlock Manufacturers Explain Business Situation—New Brunswick Conditions

Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few which have been received lately:—

Skimming of Limits—A Serious Waste

Editor Canada Lumberman:

Montreal, October 4th.

What may be characterized as second only to loss by fire in Eastern Canada timber limits is the waste in operation caused by "Skimming" of limits. So few limit owners or heads of operating companies know the exact contents of their timber areas, or have even what may be termed an approximate estimate of the timber of such areas that it is not in the least surprising that they should labor on in blissful ignorance of the fact that a very considerable portion of their limits remain untouched or wasted.

In many large pulp and lumbering concerns, the woods operations and timber cruising come under the personal supervision of a foreman, often not sufficiently trained to make an absolutely accurate estimate of the wood on the various sections to be cut upon, with the result that he usually underestimates in order "to be on the safe side" or to be "conservative."

The log making department, naturally anxious to make logs cheaply, frequently operates in such a manner as to cut and haul out the timber on the front part of the limits adjoining a water course or railroad, leaving the portion farther back, either to be cut in the vague future or not at all. Usually the parts thus left are too small to make it worth while returning with another camp equipment which would make the logs too costly, so that next year a new portion is attacked and the same tactics are repeated. Year after year, in this manner, logs are left in the rear of operations, which, if taken out with the front portions could be had at very little extra cost. This method of logging has been going on for many years throughout the province of Quebec, resulting in a condition of wastefulness which is most striking to an observer.

If limit owners or managers had more accurate information concerning the contents of their timber areas this wastefulness would cease, since a check would then be provided whereby the manager would know if all the logs of a given section had been cut or not.

Strange to say the head of a lumber company usually takes serious offence if advised of such conditions on his limits though he personally may never have been off his main roads or rivers.

R. O. Sweezy.

Northern Ontario Timber

Editor Canada Lumberman:

Cochrane, Ont., October 1st.

Much has been said and written concerning the timber resources of Northern Ontario, and many divergent views have been expressed concerning it. Though, taken as a whole, the timber may not show as good an average as some of the rich limits in the older portions of the province, there can be no doubt that the immense areas of pulpwood and other timber are such as to prove a valuable asset to the whole of the Northland for many years to come. Whatever may be said, the fact that sound business concerns such as Messrs. Jackson and Tindle, on the Mattagami River, and the Abitibi Pulp and Paper Company, at Iroquois Falls, have seen their way clear to purchase large tracts of forest in this new country, and establish costly mills, and other plant. This will satisfy ordinary mortals that the outlook from a lumbering standpoint is a bright one.

At the same time it may be well to point out that some exceedingly erroneous notions prevail as to the actual value of the standing timber, and this is especially true of the men who take up homesteads. They pay 50c per acre for their land to the government and many of them seem to think that they will net a small fortune from the pulpwood without much exertion on their part. The writer knows many men holding good positions in the towns of the north, who have taken up homesteads, but who have no more intention of ever becoming farmers than they have of becoming Archbishops. They have acquired the land purely as a speculation, in the belief that the sale of pulpwood will bring them in a big return.

The Settler's Pulpwood

As a matter of fact the majority will have to wait many years before they can dispose of their pulpwood at even fair profit. There are many reasons for this assumption. In the first place the prices which are being offered at the present time are such that the settler who does all his own chopping and hauling can do little more than pay his expenses and secure a small return for the labor he has put into the undertaking. I know of cases where settlers have engaged outside help, and in the end have found themselves with the balance on the wrong side. On paper the settler can see good money in the cutting and shipping of pulpwood, but in his estimate of what it is

going to cost him he usually fails to allow anything for contingencies, and before he has gone very far with his contract he finds that there have cropped up a number of incidentals which he never dreamed of. As things stand at the present time the settler cannot look for any profit from the actual disposal of the timber; all he can hope for is that it will supply a market for his labor in slack times. In addition to this, the important fact must not be overlooked, that every cord of wood that he cuts means that much more of his land cleared, and that much increase in the value of his holding from an agricultural standpoint. This last point is a very important one, but it is too often overlooked by the settler when estimating the return he is getting for his pulpwood.

The present condition of the Transcontinental Railway is a serious drawback to the homesteader in getting his full return from the sale of his timber. Take for instance the case of settlers at Frederickhouse, six miles west of Cochrane. The railroad is still in the hands of the contractors, who charge six dollars a car for the six miles haul into Cochrane—an almost prohibitive figure, though some of the settlers shipped out several carloads last winter. On the Abitibi River, five miles east of Cochrane, the same conditions prevail. The Abitibi Pulp and Paper Company are offering the settlers there \$3.75 per cord f.o.b. at Cochrane. On such terms there is clearly not the fortune in the undertaking that some people seemed to imagine.

Roadways Still Very Inadequate

Another drawback which the settler experiences—and it is one which he seldom foresees—is the difficulty of hauling. The trunk and branch roads which the government are at present constructing will be a great help to him in many ways, but they will not entirely solve the situation. These roads are cut north and south and east and west, not with the intention of helping the settler to get out his timber, but with the ultimate object of their being a benefit to him when he has become a real farmer. The country abounds with creeks and ravines, and though the roads may be level elsewhere, there are necessarily rises and falls at these points, and though they may only extend for a few yards they are sufficient to prevent him from putting on anything like a full load, and when he lives at a considerable distance from the track this is a matter of considerable importance to him.

There is no doubt that with the opening up of the Transcontinental Railway the outlook will be a good deal better from the settlers' point of view at all events, for he will be able to put into his pocket the difference between the excessive charges which the railroad contractors impose and the lower rates which the railway will offer. Then, too, the opening of the T. C. R. will give a decided impetus to the numerous small mills which have been in existence for some time in the vicinity of the railway, but which have been prevented from working at full capacity because the contractors' rates have made it impossible for the mill-owners to ship out all the lumber which it is possible for their mills to manufacture.

Northlander.

Hamilton Business Shows Extensive Improvement

Editor Canada Lumberman:

Burlington, Ont., October 3rd.

We are very much encouraged with the outlook for the lumber business in this district. Through July and August we felt the drop in trade and doubted whether it would again come back to normal conditions before spring, but we are glad to say that trade with us is normal at the present time. Our sales for September exceeded those for July or August by about thirty per cent. While there is not quite as much building in Hamilton as there should be, I believe that the business that is being done is safer and better than it was during the rush of a year ago.

A. S. Nicholson.

Trade Conditions in New Brunswick

Editor Canada Lumberman:

Bathurst Village, N.B., Sept. 26th.

Trade in lumber throughout New Brunswick during the past summer has not been quite as active as in 1912. There has been, however, a fair movement right along and indications now are that shipments will be brisk for the balance of the year.

Practically all lumber cut this year in the east has been sold to the British and American markets, and prices have been well maintained. The cut, however, is only about two-thirds of normal. A great many logs did not come out last spring and fully half the mills through the country are shut down, being out of logs. All the mills in St. John have been closed since June 14th, a few of them are starting up again, but none are running to their capacity and the majority are still idle. The great strike there is still unsettled. The result is that a great many mills are now sold out entirely and some are short on their contracts. This, together with the fact that Nova Scotia, Quebec and Ontario are all short of their normal cut of lumber, should have a very strong influence on prices. We predict a great scarcity of lumber for the winter and spring trade and consequently a higher range of values for 1914 product.

Labor has been scarce and wages high during the entire season. Men

are none too plentiful for the woods work and operations are being seriously delayed for want of enough men to fill up the camps. Men for the woods, now going in to the camps, are getting fully \$2 per month higher than last season and the demand is greater than the supply. The log crop will consequently be short for next year's sawing.

Everything used by the lumberman is costing higher each year, so surely he is entitled to an advance in price for his lumber.

We might saw a word about work being done in dredging our Bathurst harbor. The Government of Canada have taken this matter in hand in a business-like manner and are pushing the work rapidly. Bathurst will very soon be a first-class shipping port. Ocean steamers can, as soon as the work is completed, be loaded right in our harbor and go direct to any port in the world. This means the future prosperity of this entire district, as large industries will locate here at once when shipping facilities are available.

Bathurst Lumber Company.

Northern Woods in Good Condition for Logging

Editor Canada Lumberman:

Whitney, Ont., October 3rd.

There is not a great deal of lumbering done in this immediate vicinity. J. R. Booth has six camps operating from his Madawaska headquarters under charge of Wm. G. McKay, the Dymont-Mickle Lumber Company is running two camps to supply its Bellwood mill and the Dennis Canadian Company has four camps in and will probably put in one or two more. The latter firm has its new shingle mill completed and is putting its sawmill in shape to start as soon as logs can be moved on snow to its railroad.

Conditions for lumbering are very favorable as there has been very little rain and the swamps are dry. Men are more plentiful than at the same time last year. Lumber shipments are being hampered a good deal for lack of cars since grain movement has started. L. Van Meter.

Hemlock Stocks Very Light

Editor Canada Lumberman:

September 27th.

The 1913 season for manufacturing hemlock lumber is drawing to a close, and in fact fully 90 per cent. of the mills which manufacture hemlock are through sawing their hemlock to-day. They have but little stock in their yards and there will be no logs carried over. If the market remains normal the stock of hemlock on the market next spring will be even less than last spring. The stock of logs coming out this winter, judging from the amount of bark peeled, will not be in excess of last season's cut. Money is hard to obtain to enable operators to go into the bush extensively and timber is becoming scarce, so that manufacturers have to go farther after it, which makes the operation require more money than formerly. Hemlock lumber cannot materially decline in price, unless some unforeseen calamity strikes our country, which appears impossible. Tanbark is strictly off, although the output is not large. There will be quite a percentage of this season's bark which, in all probability, will not be marketed this season. Tanners are not using the quantity of bark this season, owing to the scarcity of hides to keep their plants running full time. This trouble is not likely to right itself for some time as there is a shortage of cattle throughout the world. This trouble reflects back to the hemlock industry. If there is not a market for tanbark, hemlock cannot be handled to advantage where it has to be floated any distance to the mill. Such conditions will no doubt have a tendency to keep operators from cutting hemlock extensively.

Manufacturer.

Hemlock Stocks a Good Asset

Editor Canada Lumberman:

Toronto, Sept. 24th.

Our belief has been that this year's production of hemlock would be 20 to 25 per cent. less than that of 1912. Information we are able to collect indicates that this estimate is moderate. Stocks in hand are not large and the indications are that stocks to be held over winter will only be in fair volume.

Our own production this year will be 25 per cent. less than our estimated output, due to inability to get our logs as fast as desired. Our information shows that stocks are very low in the hands of retailers and if our present trade is a fair indication there will be more activity from now to the close of the season than has existed during the past three months.

Woods operations in hemlock for this winter will undoubtedly be smaller than last winter, due to general curtailment on account of financial conditions and the disinclination of the bark consumers to contract.

Taken as a whole, the possibilities of the hemlock production in Ontario are now at a point where they are only equal to demands under normal conditions. Last year, under abnormal conditions the market was entirely cleaned out. With this shortage to overcome, it would require almost a cessation of business to bring about any great lowering in prices. As there is every indication that business will improve this fall, we believe any hemlock stock is a good asset.

Graves, Bigwood & Company.

Money Market Controlling Lumber Situation

Editor Canada Lumberman:

Hamilton, Ont., September 30th.

The lumber situation at the present time, is governed, I think, by the

money market, and I do not look for the lumber business to boom very much until the banks let loose of some ready money. Personally, the Long Lumber Company have had a very good September. August was very quiet, owing partly to the Centennial celebration which was held here, and, as above stated, to the tightness of the money market. As stated before, September was a very good month, practically because we made a special effort to sell our goods, to try and make up for what we lost in August. We felt that it wasn't a time to lose any business, and we went out with that in view, and although we kept our prices as near as we could to the market, we have had a very good month; better than I expected when we started out.

Hemlock keeps firm, and we feel that pine is moving a little better. We have had a big sale in yellow pine, cypress and shingles. There is a little demand for lath, and we are practically sold out. We find that the retail yards all over the country are only buying for immediate wants, and, as everybody is pushing them for money, you cannot blame them. I think that the business will run along just about as it is at the present time, until next spring; when, I am figuring that we will start again on another two years of prosperous times. I am basing my opinion on the returns which will come back from the foreign market for our Canadian wheat.

Guy H. Long.

Hemlock Timber Being Rapidly Depleted

Editor Canada Lumberman:

Burks Falls, Ont., September 26th.

Our own experience and trade connections indicate that it is impossible for the market to become overstocked with hemlock because while the standing hemlock available for tanning and lumbering purposes is becoming rapidly depleted, the demand for this wood for building purposes is constantly on the increase. Also the comparatively small amount peeled last year points to a limited stock being sawn during the present season. With regard to our own stock we shall saw about an average amount during the season, but do not expect to carry over more than twelve hundred and fifty thousand feet.

As to the quantity we expect to take out this winter, this will run between fifteen hundred thousand and two million feet.

The Knight Brothers Company, Limited.

One of the Best Stocks on the Market

Editor Canada Lumberman:

Lindsay, Ont., September 22nd.

Hemlock today is one of the best stocks on the market. All sizes are scarce. We are shipping hemlock about as fast as we can cut it and when we shut down, about the last of November, we will have very little more on hand than what will do our retail trade.

We have had a gang of men cutting hemlock all summer, and, at the present time, have on the skids for next season, about 25,000 fine hemlock logs.

We will put in four camps of our own this winter and will cut about another thirty thousand hemlock logs, besides a large quantity of ties.

The John Carew Lumber Company, Limited.

Hemlock Trade Extra Good

Editor Canada Lumberman:

Utterson, Ont., Sept. 27th.

We have found the trade for hemlock and hardwood extra good this season. At present we have cleaned all the hemlock out of our yard and most of the hardwood, and we expect to have the whole stock cleaned up by October 15th. All the mills in this locality are cleaning up faster than usual, in fact the writer has not seen lumber move so freely since 1906. Under prosperous conditions we think the cut of hemlock for 1914 will be well up to the average, as labor appears plentiful and the season, so far, for bush work, is extra good. We are not intending to take out much hemlock this season, the prospects for bark are not good and wages are high. We did not peel much. Our stock for next season will be mostly hardwood. Utterson Lumber Company.

The Competition of Yellow Pine

Editor Canada Lumberman:

Toronto, Ont., Sept. 22nd.

So far as we are concerned the demand for hemlock has not been so active this season as last, and although the stock in our retail yard and also at the mill will not exceed two million feet, we do not anticipate any trouble in securing all we will require for the spring trade.

At present yellow pine dimension is coming in here at less than we are able to lay hemlock down for and handles more profitably. For this reason we do not anticipate any advance in the wholesale price of hemlock.

The Boake Manufacturing Company, Limited.

No Stocks to be Held Over

Editor Canada Lumberman:

Hillsdale, Ont., October 3rd.

No hemlock stocks will be held over in our neighbourhood this winter. The local demand has been unusually heavy this season and indications are that this demand will also be in evidence next season. We believe this demand has not been confined to any one or a few localities, but is general throughout Ontario, and will be very beneficial to the trade. We will not be taking out a large stock of hemlock logs this winter and other lumbermen here would likely make a similar report. We regard the outlook as good.

Martin Bros.

Accounting Methods in Lumber Industry

Capitalizing Annual Charges and Outlays a Permissible Practice—Problems
Presented by the Bonding of a Timber Owning Company

By W. E. Hodges, C. A.

The system of accounting in the lumber industry differs in some respects from that of any ordinary manufacturing concern, in that there are some technical points requiring special treatment, e.g., it is customary and I think permissible to capitalize a proportion of the annual charges and outlays in connection with carrying timber limits. The principal expenses in this connection are—

This article is part of an interesting address delivered before the Dominion Association of Chartered Accountants at Winnipeg, recently. The Author's remarks upon the system of accounting in the lumbering industry are of special interest and value to lumber manufacturers.

Annual rentals paid to the Government,
Annual charges enacted for fire protection purposes.

The stronger companies in the province carry large areas of standing timber, sufficient to last them for 50 or 75 years at the present rate of manufacture, and as only a small portion of the limits carried are being logged, and the capital value of the remaining stumpage increases year by year, it would be inequitable to charge all the cost of providing for the future to the annual operations.

In support of this argument, I will make a comparison between two companies. We will suppose that one owns a large area of standing timber, and the other carries practically none. The former would have a large annual charge to its profit and loss account, and the latter, having no assets in the shape of standing timber, will have no such expenditure to be charged, except perhaps indirectly, in the shape of stumpage charges included in the price of logs purchased. Presume, for the sake of argument, that the plants of both concerns are shut down. Provided the rentals were charged to profit and loss, a big debit would result to the company owning the timber, where no actual loss had been made; the other company would have no charge to make, consequently no debit. I have heard it discussed whether the natural growth is not sufficient to compensate for the expenditure referred to above, but, in arguing this point, it must not be forgotten that in some cases the natural decay may be as much as the natural growth.

Capitalizing Annual Charges

I am of the opinion that the correct way to treat these annual outlays is to capitalize them by charging them to the timber limits account and at the end of each year to credit this account with a fixed rate per 1,000 feet for stumpage on the timber cut. The auditor should satisfy himself, after an examination of the cruiser's report, and any other information obtainable, that the rate fixed for stumpage should be sufficient to eliminate the timber limits account from the books when all the standing timber has been cut.

In the case of a company having a bond issue, there should be, and there is usually, a clause in the trust deed providing for the creation of a sinking fund for the redemption of the debentures. It should be provided that a specified sum per 1,000 feet on all lumber cut shall be set aside and handed to the trustee until all the debentures are redeemed. Where this is done the following entries in the books are usually made. The profit and loss account is charged and the trustee for the debenture holders is credited with the amount to be set aside. When the money is paid over to the trustee, and provided the bonds have been redeemed by him out of the proceeds, another entry should be made in the books debiting the bond issue account and crediting the timber limits with the nominal amount of bonds purchased. The above remarks deal with a company having a bond issue carrying a charge on their timber limits. Whether the amount provided in the trust deed to be credited as stumpage is sufficiently large depends upon the circumstances of each particular case.

In the case of a company having no bond issue, the timber limits account should be credited with an amount sufficient to eliminate the capital account from the books when the timber is all cut, and, in arriving at this amount, allowances must be made for reasonable additions to capital in future years.

It might be legitimate, and it could be argued that a certain charge for interest on the original cost of the timber limits might be capitalized; but I should not advocate this. At the same time, I have known instances where it has been done.

As the annual charge to the government for carrying a square mile of coast timber is \$146.40, and presuming this mile to contain 20,000 feet to the acre (which is a fair average), or a total of 12,800,000 feet, the cost of carrying this timber slightly exceeds 1 cent per 1,000 feet per annum.

Some accountants may not agree with my remarks as to the treatment of these annual charges, and I have known instances of auditors

not residing in the province who have in some cases written off all the annual payments, in other cases carrying forward the unexpired portion in the way the unexpired portion of a fire insurance policy is treated. I think, however, that the majority of them do this not because they do not agree with the method suggested above, but because they do not fully understand the peculiar circumstances of the case, which is the only instance I can think of where it may be permissible to capitalize an annual charge.

Analysis of Production Costs

The cost of producing lumber is divided under two distinct heads:—

1. Logging;
2. Sawmilling, including planing mill, dry-kiln, etc., in addition to which there are the office and other overhead expenses.

As a rule, the larger companies prosecute their logging on a very large scale, and at times substantial capital expenditures are made before any logs are brought to the mill, the usual items for capital expenditure being:—

1. Purchase of equipment, donkey engines, etc.;
2. Construction of logging railway;
3. Improvements in order to render a river or creek navigable for driving logs.

The chief expenditure for producing may, therefore, be divided in a general way as follows:—

1. Camp expenditures and wages;
2. Superintendent's salary and expenses;
3. Proportion of general office expenses;
4. Depreciation on logging and camp equipment;
5. Depreciation on river and creek improvements;
6. Depreciation on logging railway;
7. Royalties paid to the Government;
8. Stumpage charges for depreciation of timber limits.

A company usually has a number of camps operating, and it is customary and also beneficial to show the expenses of each camp separately, so that a comparison may be made of the cost of logging in each locality. The wages of the workmen and the cost of feeding them are a direct charge. The superintendent may have jurisdiction over several camps, and his salary and expenses should be divided accordingly. A proportion of the general office expenses chargeable will be an estimated amount varying with the particular circumstances in each case. Then comes the question of depreciation, which is rather heavy.

Logging engines are usually depreciated at the rate of from 10 per cent. to 15 per cent. per annum, in addition to which all repairs and renewals should be charged to operating.

In cases where it is necessary to use either a logging railway or a river or creek for the purpose of transporting the logs, the question of depreciation is an important one. Although the use of the logging railway or a river (or creek) is by no means general, at the same time several companies have made large expenditures either for one or both of these objects.

It is usual to make a charge of a fixed sum per 1,000 for all logs hauled over the railway, which may be arrived at in the following way:—

Make an estimate, by examining the cruiser's and other records, of the approximate amount of timber tributary to the railway. From this may be ascertained the amount per 1,000 feet of timber expended on construction of the railway. Theoretically this amount should be charged to the cost of logs as depreciation on the railway, but I would advocate that a reasonable margin be allowed for errors and contingencies; in any event, it is essential that a sufficient charge be made to eliminate the book value of the railway when all the timber tributary to it has been cut. Allowance, however, may be made for the value of the rolling-stock remaining, and also to a reasonable extent for the value of the roadbed for other purposes.

The depreciation on river and creek improvements is arrived at on the same basis, although the two cases are not exactly similar.

Analysis of Milling Costs

The cost of milling consists generally of the expenses of operating and repairing the sawmill, planing mill, and dry kiln, in which is also included the cost of superintendence, grading, and piling in

the yard, fire protection, liability insurance, proportion of general office expenses, and depreciation, the latter item varying largely with the class of mill and also as to the locality. Some of the mills are constructed on a more permanent basis and with more expensive buildings and machinery than others, and the latter should bear a larger rate of depreciation than the former. Again, the majority of the mills are built on the water, either the sea-shore or some inland lake or river; but some are built inland and have no water transportation. The amount of accessible timber tributary to these inland mills would become exhausted in a shorter time than in the other cases, and this should affect the rate of depreciation, because, when all the timber accessible to a mill is cut off the salvage value is the only value remaining.

A few difficulties present themselves in taking stock, and the method of valuation usually adopted in the lumber industry is different from other manufacturing concerns, inasmuch as it is not customary to value the manufactured lumber on hand at cost, but at the selling price, less a reasonable amount for realization expenses, varying from 15 per cent. to 25 per cent. This custom obtains because it is practically impossible to actually define the cost price of manufactured lumber. Two or three different qualities may be manufactured from the same tree, yet the cost price of logging and also of cutting it up is practically the same, and the selling price may differ as much as \$20 per 1,000; and, under these circumstances, if the valuation at cost price were attempted, the profit and loss account each year would be materially affected if the company disposed of all its best quality lumber and kept the inferior grade in stock. Under these circumstances, I am of the opinion that the valuation on the basis of selling price less realization expenses is the correct one.

The actual stock of manufactured lumber is easily counted, and the quantity in the yard may be definitely ascertained, but taking stock of the logs on hand is at times more difficult. Some companies make a practice of scaling all their logs, but this is not the invariable rule. In any event, there are circumstances in which this is a physical impossibility. Therefore the stock on hand must be partly estimated.

It often happens that expenditures have been incurred in opening up a logging camp, and very few, if any, logs have been delivered to the mill. If none have been delivered the whole expenditure is carried forward as an asset; if a comparatively small amount have been delivered, these are usually credited to the camp at the estimated market price, and the balance of camp expenditure then remaining is carried forward; but if the camp has been in operation for some time the correct thing to do is to take an inventory of everything in it. I would point out that in some of the mountain districts in British Columbia logs are only delivered once a year, in the spring at high water, some of the rivers being too shallow to drive the logs at other periods.

Checking the Stock Inventory

In preparing the final accounts, an approximate check of the inventory of manufactured lumber may be made as follows:—

To the lumber on hand at the beginning of the period add the amount manufactured, which may be obtained from the quantity of logs delivered and manufactured at the mill. This may be prepared from the tallyman's reports, who is employed solely for the purpose of making daily reports as to the quantity manufactured.

By deducting from this total the amount shipped during the year the inventory on hand is shown. Of course, this check is only an approximate one, but if sufficient care is exercised in carrying it out the auditor can satisfy himself that the quantities shown in the inventory are approximately correct. In preparing these figures, allowances must be made for the overcut or undercut, as the case may be. Theoretically, 1,000 feet of logs is supposed to produce 1,000 feet of manufactured lumber, but I think in practice there is usually an overcut varying from 5 per cent. to 15 per cent.

According to a report issued by the Vancouver board of trade the total output of manufactured lumber in the Province of British Columbia during the year 1912 was 1,262,000,000 feet. Of this, 902,000,000 feet was sawn by the coast mills, and 360,000,000 feet by the mountain mills in the interior. This, at an average price of \$18 per 1,000, which may be taken as a fair average, produced \$22,716,000.

Of the total output 394,000,000 feet was sold locally on the coast, 817,000,000 was sold in Alberta, Saskatchewan and Manitoba, and 51,000,000 was exported to foreign countries. It will, therefore, be seen that the settlement of the prairie provinces has been of great benefit to the industry.

In addition to the lumber produced in the province, it is estimated that the mills in the United States sold 300,000,000 feet in our territory.

The competition from the United States has been strongly objected to by the manufacturers, and on several occasions steps have been taken to induce the Government to impose a duty, but with no success. At the present time manufactured lumber in the rough

comes into this country free of duty, but dressed lumber is subject to a duty varying from 17½ per cent. to 25 per cent.

The money invested in the timber industry may be divided into two classes, namely, investments in holding companies, who do not operate a mill or who only do so in order to earn sufficient money to pay the carrying charges on their holdings, and investments in operating companies, whose object is to earn sufficient money from actual operations to pay dividends to their shareholders. I think it may be said that practically the whole of the money invested in holding companies originally came from the United States, with perhaps a small amount from Eastern Canada. The shareholders in these companies do not receive, neither do they expect, regular returns on their investment. I know of one large American concern who in their prospectus stated that subscribers were not to expect either regular or immediate returns. In addition to the original purchase price, those companies who do not operate have to take care of the annual charges and expense of carrying their timber, and it is therefore necessary for the shareholders to contribute yearly until a sale is effected of the whole or a part of their holdings.

Some of these companies have made enormous profits on their investment, particularly those whose directors had the foresight to anticipate the general rise in timber values.

Prior to the year 1905 the amount of money invested in purely operating companies was not large. After that date legislation was introduced providing for more permanency in timber holdings, but even then the holders of special licenses could only obtain a lease to their timber rights for twenty-one years. In 1910, however, it was enacted that special timber licenses could be held as long as there was merchantable timber on them, which gave the holders a lease in perpetuity if they so desired. It was at this period that British capital became interested, and several flotations of large bond issues were made in London and other financial centres, in some cases for more than the property under the most favorable circumstances could hope to return to the investor. For various reasons the majority of the companies floated in Europe came to grief and defaulted upon their interest. I think I am right in stating that only one or two public companies in British Columbia who have floated a bond issue in Europe have not made default in paying interest on their debentures; some of them did so without even paying a single coupon.

The issues were made not upon the records of the profits earned in the past, but on an estimate of the profits to be earned in the future, and I do not know a single instance in which the actual profits earned have been anywhere near the prophecies made in the prospectus.

A Detrimental Bonding Policy

Some companies have made bond issues upon their properties to the extent of a large part of their market value. I maintain that this policy is detrimental both to the debenture holder and to the company itself. The former will not receive the interest he anticipates, and the company will not be in a position to pay it and will be in financial difficulties in a short time. As the creation of a bond issue imposes an obligation to provide for fixed annual charges for interest and sinking fund, I am of the opinion that the extent of the bond issue should be determined by the profits the plant is capable of earning by operating and not by the value of the timber holdings. I am in favor of a debenture issue being made on the above lines as a first charge upon the timber and fixed assets. Provision, however, should be made in the trust deed for the creation of a sinking fund by the payment to the trustee of a fixed sum per 1,000 feet of all lumber cut, which should not be less than \$1.00. The trust deed should also be drawn so as to exclude the manufactured lumber and logs from the charge created, so that the company will not be hampered in its borrowing powers, and may be able to transact its banking business in the usual way by borrowing on produce loans.

I consider it the duty of the auditor to examine the trust deed very carefully and to justify himself that all the provisions are being carried out, and a special paragraph as to the provisions regarding the creation of a sinking fund and the redemption of debentures might, I think, be included in the ordinary report.

Although the title of this paper is "The Timber Industries of British Columbia," I have only dealt with the legislation, finance and accounting relating to the chief product, namely, manufactured lumber. The other products are pulpwood, shingles, railway ties, cordwood, poles, etc. Although as long ago as 1901 the Government gave concessions to promote the pulp industry, it was only within the last year or so that paper was manufactured in the province, then by only one company, who have erected a very large plant. As it has only been in operation a short time, and I know practically nothing of it, I have not dealt with it.

The other items are practically by-products of the larger industry, and I know of no special point requiring comment. It is true that numerous shingle mills are located all over the coast, but the money invested in them is comparatively small as compared to the main branch of the industry.

Timber Measurements Old and New

Development of Present Day Methods—Those of Fifty Years Ago—Effect of Steam Vessels

By Edward Harper Wade

In 1861, Mr. William Quinn, Supervisor of Cullers at Quebec, was sent by the Provincial Government to Great Britain. On his return to Canada, he commented with great force on the system, or rather want of system, in the measurement of timber, which he found existing on the other side of the Atlantic, and suggested that it would be most desirable if the Imperial Government would determine on some uniform mode to be adopted at all its ports. This suggestion had no result.

For settlement of freight purposes, all timber was then measured by calipers, and customs duties were paid in Great Britain on Queen's caliper measure. The diameter of the hewn log was taken in the centre from the middle of the sides, and the length taken to the half foot, and from these measurements the contents in cubic feet was worked out by sliding rule or printed tables. In London and all along the east coast of England, this was also used for purposes of sale by importers to consumers. In Liverpool, and very generally on the west coast of England, a different system for sale invoicing by importers to buyers was in use. The circumference of the piece was taken in the centre with a string.

This string was doubled and redoubled, afterwards being held alongside a rule, and the quarter girth so ascertained was used for contents calculation in connection with the length taken in feet, the slightest deficiency causing the loss of the foot, so that twenty-nine feet eleven inches and seven-eighths of an inch only counted for twenty-nine feet long. The cubic contents of the log were ascertained by Hoppus's printed measuring tables, which gave the solid measure in cubic feet, inches and parts, an inch being one-twelfth of a foot and a part one-twelfth of an inch. In the Clyde and Scotland generally the circumference was taken somewhat differently, giving a larger cubic return than the Liverpool system, where the quarter girth was reduced by the doubling of the string. These systems are all still current. The Liverpool custom was, and still is, to make allowances in measure for defects, so differing from all other systems. The Quebec method of that day, as at present with square timber, was to measure with a steel rod or gauge, having at the end a five-eighth inch hook, and marked off in inches. The gauge was applied to two sides of the piece of timber and drawn till the hook caught on the wood. The length was taken to the foot, but about eleven inches frequently passed as a full foot in taking lengths. At present the full length has to be there to count. The cubical contents were ascertained from printed tables, based on multiplication together for the length and two side measurements, the result being divided by 144. In Hoppus's tables there is only one-quarter girth, which is used twice in process of multiplication in same manner, before using the divisor 144.

The Coming of Waney Timber

With the coming to the Quebec market of waney timber in 1861, it was evident that another system of measurement from that of the gauge or rod had to be adopted. An elaborate set of tables, providing for an allowance for wane on caliper measure, was printed, but found too intricate and cumbersome for general business purposes, and the present system of tape measure came into use for waney timber under the name of string measure. The circumference at the centre of the waney piece of timber is taken with a tape, marked off in inches. This tape was formerly of linen, but is now more generally of steel. It is drawn tightly round the log, and the quarter girth taken from it. This is called string measure. The result is very much the same in practical working as the Scotch system, and Quebec measurements at present time closely approximate thereto, while the Liverpool outturn always shows a loss on Quebec measure in waney timber, very naturally. Round timber is generally sold string measure, taken with the tape after the removal of all bark at the centre of the log. In some ports it is cubed by Hoppus's tables founded on 144 divisor, but in London and other places the tables for round timber are based on 113 divisor, giving approximately the absolute solid contents. Freight on timber in the old sailing ship days was invariably paid on caliper measure, at per load of fifty cubic feet, but with the change from sail to steam a different system came into use, and became general. The rate now is per St. Petersburg Standard Hundred of 165 cubic feet, intake Quebec measure, being by gauge measure in square, and string measure in waney timber.

The Course of Freight Charges

Fifty shillings per P.S.H. is the equivalent of 15 shillings 3 pence per load Quebec measure or 14s. 6d. square timber and 12s. 9d. waney timber, per load caliper measure. During the freight depression of 1909 and 1910 the current rate from Quebec to Manchester for both square and waney timber was 50s. per P.S.H. a great reduction on

the lowest figure at which it was possible to carry timber by sailing vessel. In 1858 freights, which opened at 25s. to 28s. 6d. were considered low, and the closing figures for that year of 22s. to 24s. most ruinously so. In 1867 they were considered unremunerative at 25s. to 28s. for Liverpool and Clyde. During the good business year of 1873 freights were high during season, closing at 45s. for Liverpool and 42s. 6d. for Greenock, all at per load of 50 feet caliper measure. This explains the passing of the sailing ship and the coming of the steam freighter, marine insurance by steam being also decidedly cheaper than by sail, in addition to the much lower possible freight rate.

What Are Broom Handles Made Of?

Editor Canada Lumberman:

Thornloe, Ont.

Can you give me any information regarding the manufacture of broom handles? I have been told that small poplar and birch are used to a large extent. Any information regarding sale-price, kind of wood used, etc., will be greatly appreciated. Yours truly, J. H. Shillinglaw.

Maple is the favorite material for the longer handles, such as those used in brooms. Ash is also used for these and for shorter handles of whisks, hammers and shovels. For the more expensive handles where straight grain is required the material is purchased in the log and split into bolts. Other manufacturers purchase their bolts ready cut to suit the size of the handles they produce. For smaller stock, lumber down to three-eighths of an inch is used.

The Forestry Branch of the Department of the Interior, which has recently conducted an enquiry into the uses of all kinds of woods in the province of Ontario, reports that it has no record of either birch or poplar being used for broom handles in Ontario or in the Maritime Provinces, although these woods are used for brush, whisk and whip handles, and may be used to a certain extent for brooms, but not mentioned in the reports made to the department. Our information also is that poplar would not be a good wood for broom handles, but that birch would be an excellent material for this purpose.

Mr. H. H. Gibson, editor of the Hardwood Record, in his recently published book on "American Forest Trees," says "birch broom handles have been a commodity since the first lathe went to work on that product. They are made of all the commercial birches, but yellow birch contributes a large part. Other handles are manufactured of it also, such as are fitted to hand saws, planes, drawing knives, chisels, and augers.

The following table from a bulletin recently issued by the Forest Branch of the Department of the Interior shows the classes of wood used in Ontario for the manufacture of handles, their quantity, value, etc.:

Kind of Wood	Per Cent.	Quantity	Value	Average Value	Supply by Regions			
					Ont.	Eastern Canada	B.C.	Foreign
		M.Ft.B.M.	\$	c.	M.Ft.B.M.	M.Ft.B.M.	M.Ft.B.M.	M.Ft.B.M.
Total	100.0	6,907	207,156	29.99	4,538	200	...	2,160

Restigouche Operators Will Cut 165,000,000 Feet

A despatch from Campbellton, N.B., states that the lumber cut for the coming season on the Restigouche river will amount in round figures to about 165,000,000 feet, according to approximate estimates furnished by an official of the International railway, which has played an important part in the lumber development of this section of the province. The International railroad is now entering on its third year, and with each succeeding season of its operation the lumber business shows a material increase. Before the advent of the railroad lumbering operations in this part of the province were attended with more or less obstacles. The men and supplies used to be sent up the Restigouche in boats and scows a distance of perhaps fifty miles or more.

Much of the lumber in this northern section is being sent across the boundary line into the United States to be manufactured at the Van Buren mills. The Van Buren Lumber Company, which has been operating practically the year around at Van Buren, gets its supply on the International line, it being transported across the St. John river on the International bridge. The Shives Lumber Company and the Richards Manufacturing Company, will cut about 35,000,000 each. The W. H. Miller Company, will cut 20,000,000. The Dalhousie Lumber Company, will cut 30,000,000. The Chaleur Bay mills, will cut in the vicinity of 25,000,000 feet. The B. A. Mowat Company, plans to take out about 20,000,000 feet.

New Mill Erected at Woodstock, N.B.

Smith Lumber Company Replace Plant Recently Destroyed by Fire—Modern Equipment Installed

The accompanying illustrations show the interior and exterior of the mill at Woodstock, N.B., which has just been completed by the Smith Lumber Company. On April 26th of the present year the company lost its former mill by fire, and Mr. W. M. Smith, owner of the mill immediately prepared plans for the erection of a new mill. Had it not been for the difficulty experienced in securing machinery he would have had the mill in operation sooner. As it was, operations were commenced on August 26th with a full crew of thirty men. The new mill is one of the most modern of its size in the province. It is situated on the site of the former mill and has six acres of land

Smith Lumber Company's New Mill—Woodstock, N.B.

for piling its output. The mill building is 120 ft. x 32 ft., with a lean to of 40 ft. x 12 ft. The boiler house is 22 ft. x 36 ft. Power is obtained from a 100 h.p. engine furnished by the Robb Engineering Company of Amherst, N.S. The new machinery installed includes a gun-shot feed rotary, gang edger, shingle machine, lath machine, surface planer with rotary bed and barrel-heading machine.

The rotary is of the Lane pattern manufactured by the Madison-Williams Company, of Lindsay, Ont., who also furnished the barrel-heading machine. The gang edger was furnished by the American Saw Mill Machinery Company, of Hackettstown, N.J., and sold by their Canadian Agents the Canadian Fairbanks-Morse Company. The shingle and lath machines were furnished by Connell Bros., Limited, of Woodstock, N.B. All the line shafting in the plant is ball bear-

ing, this feature having been provided by the Chapman Double Ball Bearing Company of Canada, Toronto.

The Smith Lumber Company obtains most of its logs from settlers living along the Meduxnakik Creek, who are able to float their logs directly to the mill. During the winter the company does a large business in custom sawing and also operates upon timber secured from its own limits in Northampton, whence the logs are hauled to the mill on the snow.

Most of the output of the Smith Lumber Company is sold in the United States and up to the present has had to pay a duty of \$1.25 per thousand feet when crossing the border. This duty will no longer be charged as the new tariff bill passed by the United States has

removed it. Some of the output has been sold to the C. P. R. for repair and new work. During the coming year the company will also have a good customer in the St. John and Quebec Railway Company. The mill makes its shipments by the C. P. R., having only a short haul from the mill to the track. The capacity of the new mill is from 30,000 to 35,000 feet of long lumber, 13,000 shingles and 20,000 laths per day. From its waste wood it manufactures about 500 barrel heads per day, for which there is a ready market.

A Problem for Sawyers and Filers

—an Observers Solution

Editor, Canada Lumberman:—I would like to call your attention to some facts relative to things I have observed recently in one of our Canadian sawmills where they were trying to save lumber by using thin saws.

The logs were white pine, averaging about ten inches in diameter and of good quality. They were slabbing or "siding" them into cants $8\frac{1}{4}$ inches thick with a twin band-saw machine, the saws being sixteen gauge. The majority of these cants were both twisted and crooked, in passing through the slabbing machine. Some of them were crooked at least $\frac{1}{4}$ inch and many were twisted at least $1\frac{1}{2}$ inches. Thus the twin band-saw machine did but very inferior work.

When sided, the cants were being turned down to a gang where they were being cut into one-inch boards, or boards supposed to be $1\frac{1}{12}$ inch, rough thickness.

This gang was one of the latest model. It had an iron frame placed on a concrete foundation and the latest improved oscillation, which in changing the feed also changes the oscillation to correspond to the amount of feed carried. It was running at a speed of 275 strokes per minute, with a stroke of 15 inches. The saws were 14 gauge with teeth spaced one inch. The feed carried was $1\frac{1}{8}$ inches to a stroke.

Under these conditions, when the gang was standing at the highest point the lowest or bottom tooth of the saw came even with the bottom of the log or cant. Thus only 13 teeth could cut through the log, for the upper teeth reached into the log only $\frac{1}{4}$ inch, as the cants were $8\frac{1}{4}$ inches thick. This left every tooth to cut fully $1\frac{1}{12}$ inch. It is not necessary for me to say to a practical millman that the lumber was very rough on the face. In fact I will vouch for it that the boards I saw would not clean up more than $\frac{7}{8}$ inches thick, and $7\frac{1}{2}$ inches wide. On account of the short stroke and heavy feed the boards were torn on the under side, with the corners completely gone back fully one-quarter inch. When one remembers also that the boards were crooked in the edge and twisted in slabbing, it is doubtful if the boards would be merchantable at the above dimensions.

The filer who had charge of these saws informed me that they had tried No. 16 gauge saws in the gang but, on account of the short stroke and heavy feed of the gang, and the crooked and twisted cants coming from the twin band-saws, he had to get thicker saws and to increase the width of the set or kerf so as to give proper clearance to the saws. At that time the kerf was wide enough for a nine-gauge saw.

My opinion is that if this machine had a longer stroke, and a corresponding longer saw were used, say eleven-gauge, with more teeth to do the cutting, with a slabbing machine that would turn out straight cants, money would be saved. The cut lumber, when passed through a planer, would make the proper dimensions. This the lumber which was being manufactured as described above would not do.

In this case an effort was being made to save lumber by the use of thin saws but it was going to extremes. In the end, more lumber was being wasted in planer chips than would have been if the machine had been run properly.

The situation which I have described above obtains in a great many mills in Canada at the present time. This fact, I think, explains why there is so much complaint regarding inferior sawing.

I. N. KENDALL.

New Hardwood Lumber Directory

The National Hardwood Lumber Association have published a new issue of their hardwood lumber directory, which has already become a most important feature of the information and service given by the association. The new issue is much larger than any previous one, partly on account of a material increase in the membership of the association and partly because it contains features which have not formerly appeared in the directory. In addition to the official list of members of the association, arranged alphabetically according to states, the directory contains much detailed information relating to the association.

The Retail Dealer and His Problems

The Value of Displaying Retail Stocks to Advantage

Retail Stocks Require Good Display

Sometimes a lumberman may wonder just what benefit he has received from attending a trade convention. He may not be able to calculate the advantage closely in dollars and cents, but it is certain that, listening to the addresses of the leaders in his business and becoming acquainted with them in a much more personal way than usual, is a wonderful assistance to any retail lumberman. There are some men who attend a convention and return with little except the memory of an exceptionally good time spent with a lot of jolly good fellows. There are others however, and many of them, who systematically note the many important points brought up for discussion and sift them carefully, upon their return home. These dealers cannot fail to obtain many valuable suggestions for the conduct of their business in the future. By way of illustration; a case occurred recently which shows the truth of this statement. At a large retail convention one of the members delivered an address upon "Merchandising Methods in Retail Yards." The gist of the speaker's address was that under competition constantly growing keener in the retail lumber business, the dealer must use greater resourcefulness to sell his goods. The most important point was that he must place his goods where they can be readily seen.

Many a lumber dealer and many a customer, upon reading this will immediately bring to mind the dark and dirty shed in which some retail stocks are often stored and will also recall the numerous retail offices they have seen, which are small, dingy and ill-kept. In such offices and yards, stocks of many kinds are stored away together, making the customer wonder how on earth the dealer is ever able to

place where he must bring his business. The whole building in short will demonstrate that the dealer is anxious and able to give his customers the best possible service.

The above ideas were enlarged upon by the speaker already referred to. There were some at the meeting who considered that this advice was very interesting from a theoretical point of view, but that it was not practical; in other words that it would involve the investment of a few thousand dollars for which there would be no return. They believed that all their customers knew just what kinds of stock were carried in their yards and that they never lost any sales, by reason of not having the stocks logically arranged and attractively displayed.

How the Plan Worked Out

For the benefit of such dealers we may describe the experience of another member who took to heart what he had heard and put it into practice. Thinking over the suggestion regarding an up-to-date show room he returned home. He allowed some time to elapse before getting down to actual work upon the scheme. In the meanwhile he was given several reminders of the importance of the plan. A certain farmer who was making extensive repairs to his buildings came into the yard and hauled away 50,000 shingles and some lumber. A few days later the farmer told his carpenter that he had to buy some windows and that he would go to another town where he could get them. "Why don't you go to the yard where you got those shingles?" said the carpenter, they handle windows and they are six miles nearer to you than the other yard. It may seem strange, but this very farmer was surprised to learn that the yard where he bought the shingles also carried windows. He believed that he must go on to the other town to get them. Another farmer drove into the same town, bought some tarred felt at the hardware store and then went over to the lumber yard for some lumber. He also was much surprised on learning from the lumber dealer that he might have bought the tarred felt at the lumber yard.

These two instances happened about the same time and the dealer was forcibly reminded of the show room idea. He finally realized that he must have a place to show his goods and he drew up a rough plan of the office and showroom building as reproduced in the accompanying illustration, for which we are indebted to the "Retail Lumberman." The size of the building is 24 x 50 ft. and it provides a spacious showroom, a public office, a private office and a workroom. The location of the office is such that everyone who wishes to enter must first pass through the showroom and see the many different lines carried in the yard. Along the street, the building provides for large plate glass show windows. The building will have a basement for storage purposes and will be two storeys high, the second floor to be used for office space. The total cost will be in the neighborhood of \$2,000.

The financial end of this improvement figured out in the following manner. The dealer estimated that 6 per cent. was necessary as a return on his investment, 3 per cent. for depreciation and a certain amount for taxes and insurance. He thus found that he must make \$200 annually out of the new building in order to cover the cost. In other words he would have to increase his daily sales by a trifle over \$3 so as not to lose any money on the new arrangement. Speaking of the scheme the dealer said he was certain that he would be able to even double this amount. He was convinced that the investment would be a very profitable one.

One of the first effects of this development by the retail lumber dealer was that other merchants in the town commenced to follow suit, realizing that the public like to trade with a merchant whose place of business has a prosperous appearance. These merchants themselves will require quite a lot of stock from the retail lumber yard and thus the undertaking commenced to pay for itself handsomely from the outset.

This dealer has done something which makes him almost a pioneer in his line of business. One will go a long way before he will find many retail lumber dealers who have an up-to-date showroom. If one can judge by the course of events in other businesses however, it is safe to say that before many years there will be a large number of them. The man who waits for trade to-day will not get it. The man who goes after it and attracts it, is the one who grows with the times.

The Western Forestry and Conservation Association will hold its annual conference about December 15. This year it will meet at Vancouver, B.C., and will give its main consideration to the problem of forest fire prevention and control.

Plan of lumber yard display room

make a satisfactory or profitable sale, because whenever the customer wants anything which is the least bit out of the ordinary, the dealer has to grovel in dark corners among dusty old stock, as often as not finding that, although he has the very article required, it cannot be located and something else has to be offered in its stead.

Importance of Attractive Display

It is not sufficient that a dealer should bring his goods into view. If he wishes to be successful he must display the goods to the best advantage and arrange them in a manner that will automatically awaken interest in customers. He must in short, be always educating the public to the fact that when they want anything in his line they can get it at his yard, without delay, and that it will be the very best of its kind. In other words his attention must be given, not only to making profits on the goods which he sells, but to compelling the attention of every individual who comes to his yard, or who even comes within sight of it. This principle has been put into effect by a great many successful retailers throughout the country and is to-day the rule, rather than the exception. The old dingy office and ill-arranged yard are giving place to the bright and well-lighted building. The uninviting front has been supplanted by a bright and well-lighted building with show windows along the street to display the smaller side lines. A well-arranged office of this nature will have a large room, well lighted, in which roofing, paint, wall-board, front doors, screens and any other stock lines are displayed attractively. Inviting chairs for customers and prospective house-builders will be provided where customers may consult with one another and study details of their building plans. The appointments throughout such an office will inevitably invite trade and convince the customer that this is the

Reduced Cost of Dressing Lumber

Seventy-five per cent Taken off by Modern Machinery
—Careful Arrangement of Equipment

It is almost impossible to lay out a plan for a planing mill that will suit all manufacturers. The writer has made some improvements in a mill which reduces the cost seventy-five per cent. from the way we were manufacturing one year ago, so it looks as though it would be practical for others, says a contributor to the Woodworker. Our mill, in which we plane and match spruce boards, also factory flooring of hardwoods, is situated in one end of a large building and next to the box shop. We keep the time of the planing mill crew separate, but all defective boards that are sorted out after passing through the planer are passed over to the box shop and the planing mill loses the labor on them. Any waney edge boards that are equal to No. 2 in quality and fit to edge, are sorted from the box boards, passed through the edger and on to the planer for dressing. All hardwood boards are brought into the planing mill and edged, split, trimmed, planed, matched bundled and loaded into car.

Our work in the planing mill was done with two old-style planers, one of eastern manufacture and the other of western manufacture. The average cost per thousand feet to handle these boards, after they were brought into the mill to plane, match, trim, sort and load in the cars, was \$2.40 per thousand feet. We have since remodeled the planing mill, adding a wing 60-feet long, installed one fast-feed planer

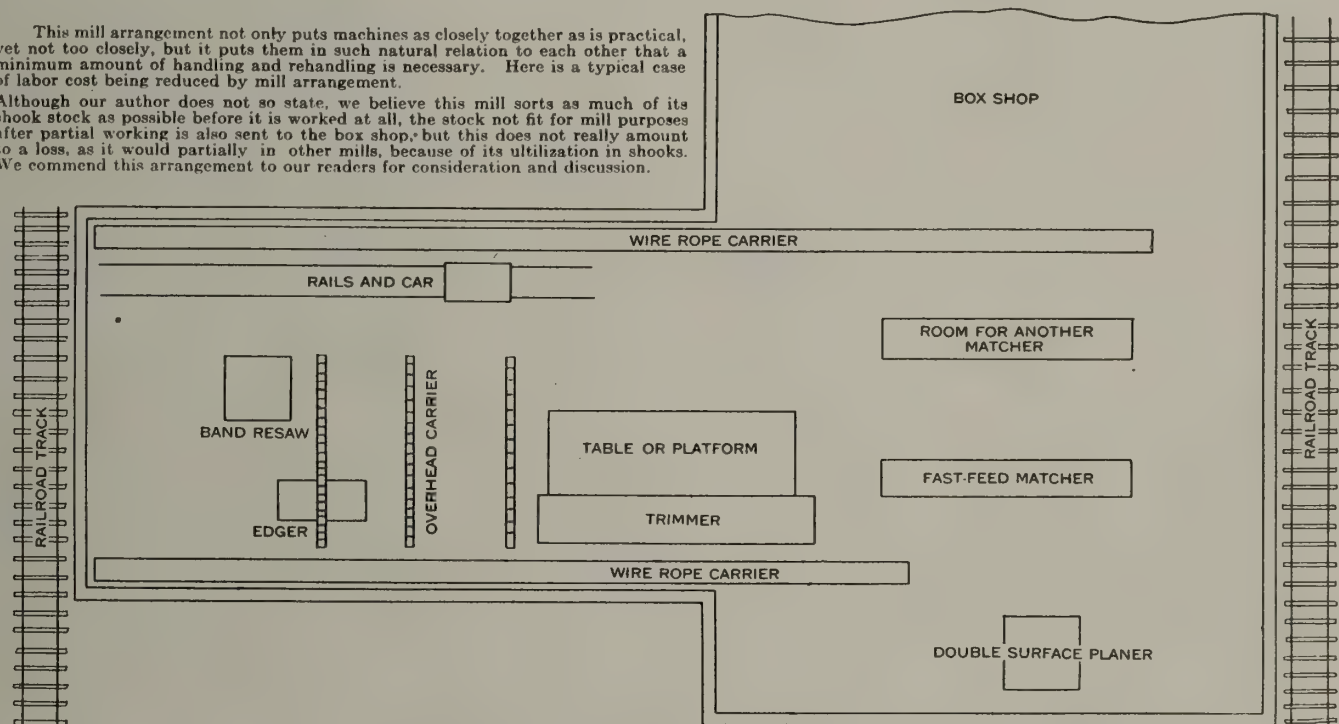

carrier to supply the box shop with boards, which are taken from the cars or teams. Notice also the location of the band resaw and edger. Stock is passed through the band resaw, and, if defective, the man who takes away places the boards on the carrier to the box shop. If good, they are placed on a chain carrier which runs on an incline of 45-deg., then overhead, so that the gang edger and edging saw are underneath. After the boards are passed overhead they drop into the planing mill carrier and are delivered to the trimmer. The man who takes away from the resaw passes the boards that are clear or need the clear split off, and such boards as need edging, to the edger. These boards are edged and the clear sorted and piled back until enough has been saved to work, or are drawn to the yard until needed. We match about 550,000 feet per month and make 600,000 feet of box shooks per month. You see, these carriers have some work to do.

We find that by installing the fast-feed thin-knife planer we have increased the quality of our stock at least 10 per cent. In dressing knotty spruce and hemlock boards on the old style planer, the knots would tear out, making the boards of an inferior grade or turning them into box boards.

No doubt when some mill men read this article they will say it was costing us too much to do this work in the first place, and I will admit it was. But you must take into consideration the amount of waney-edge boards that are sorted from the box boards, and there is quite an expense to that. We are doing the same now as before, but with the carriers we have eliminated the cost accordingly. In constructing a new mill this extension should be at least 72-ft. long in-

This mill arrangement not only puts machines as closely together as is practical, yet not too closely, but it puts them in such natural relation to each other that a minimum amount of handling and rehandling is necessary. Here is a typical case of labor cost being reduced by mill arrangement.

Although our author does not so state, we believe this mill sorts as much of its shuck stock as possible before it is worked at all, the stock not fit for mill purposes after partial working is also sent to the box shop, but this does not really amount to a loss, as it would partially in other mills, because of its utilization in shooks. We commend this arrangement to our readers for consideration and discussion.

Layout of the Mill which Reduced Cost of Dressing Lumber 75 per cent

and taken out the two old ones, installed a band to resaw 2 and 3-in. plank into boards, placed carriers for handling the boards, and find our cost, including the running of the band re-saw, is 93c per thousand feet, including a great deal of work for the box shop that has not been charged to it yet.

We saw a great deal of our small spruce and fir 2-in. thick through and through on the waney edge. Then it is drawn to the mill after it is dry, and resawed. One board may be passed to the edger, the other to the box shop. When you take 35c per thousand for resawing, from the total cost of 93c, you will see \$1.82 saved on the cost per thousand feet as compared with the former cost.

Herewith is a small sketch of the layout of the mill. You will notice there is a wire rope carrier extending from the end of the planing mill to the planer. The boards are taken from the car or team, as it may be, and carried on wire rope carrier to the trimmer, where two men trim them to length. The trimmings that are long enough are saved out for box stock and thrown on one side, where there is a small double-surface planer. Any spare time, when the large matcher stops to sharpen or joint knives, the men plane the few boards that have accumulated and send them to the box shop. Having these boards trimmed before matching eliminates the running of several thousand feet in length of waste boards through the planer and matcher per day. As these boards come over the trimmer, a man places them for the operator of the matcher, and they pass through at the rate of 200-ft. per minute, direct to the car, where a man loads them.

On the other side of the planing mill will be noticed another

stead of 60 ft., then when resawing you will have room enough behind the elevated carrier to sort out certain widths when you have an order for a car all one width.

We find that when we saw logs at small portable mills it is better to have them sawed into 2 or 3-inch plank. When dry, they are drawn to the planing mill, where they are resawed, planed and matched for shipping. There is a saving of 1,000,000 feet in 8,000,000 on 2-inch, and 1,000,000 feet saving in sawing 6,000,000 on 3-inch, and the cost of stacking, drawing, etc., is reduced in handling thick stock. It is getting to be the custom among lumbermen to resaw as much as possible. Some are even installing twin resaws, making three boards at one run of a 3-inch plank, which will still reduce the labor of manufacturing the finished board.

The problem of reducing costs does not fully lie in the selection of new machines. Many times the most efficient machines are used in systems where production cost is far too high. Arrangement of machines is a big factor in costs, just as it is a factor in the quality produced. Lost motion is one reason for abnormal cost. Wasted time is another. But when these factors are combined with worn out, slow machines, profits have no chance of staying with us long.

In this case the best machines built took the place of slow tools, the machines were so arranged in reference to each other, to the carriers, and to outside supply and delivery openings that lost motion, cartage cost and waiting were undoubtedly practically nil. In such systems as the one described on this page training operators and employees plays a large part in the system's ultimate efficiency; but with or without good training it is far better than no plan at all.

The Selling of Bills

It takes several years to learn how to sell a bill to advantage, and with all the experience I had at it, I found there was still something I could learn about bill selling. I know of no other reason for its being so, than the variety in human nature that one meets in these transactions, and these diverse elements in human nature are not more strongly shown in the majority of people than when they engage in a matter of building and the purchasing of materials for it. The facts in the matter are, very few people know anything at all about the details of a building and the nature and character of the materials entering into its structure. Therefore the masses of people generally know of a building as a place to live in, or something to use for storage and shelter, but how the materials were made, assembled, and put together they are practically ignorant of. It is with this latter class that the retail lumbermen has mostly to deal. Added to this, is the natural tendency of the buyer to want to purchase at the lowest price and with the great majority, the low price will govern their action in taking the bill. This is what makes the competition of the mail order concerns so aggravating to the dealer. These people see nothing but the letter and copy of the bill, and the price it is offered at, and being ignorant of the quality of materials, the low price is a stronger inducement with them than it would be to those who know there is a difference in quality, and therefore a difference in values.

When I am trying to sell a competitive bill, I would much rather deal with a party who knows what these differences mean as to the prices than with one who does not know, and considers the price he can get it for. Some men never learn by experience. At least, they don't learn enough to allow it to govern them in their buying. Others know by past experience that the best material for everything is the cheapest to buy because it gives them the longer and best service.

I presume there is no class of consumers of lumber that comes into such close and direct knowledge of the strength and lasting qualities of lumber as do the farmers, especially with the commoner grades. They know more about lumber in this respect than the average carpenter. So when it comes to selling a farmer a bill for a barn or other outbuilding he is generally more difficult to please than he would be in selling him a house bill, because of the fact that this class of buildings contain mostly common lumber, whereas, there are so many more things in a house other than common lumber that he knows but little about, and therefore he has to take somebody's word for it. I had an old farmer customer once who was particular about the dimension and common boards he bought and would "kick" on anything he didn't like, but as he wasn't much of a haggler about prices, I tried to humor him as well as I could. I was surprised therefore, when one day he brought me a list of stuff for an addition and repairs to his house, as he handed it to me he said "there is a lot of stuff in this bill that I know but little about. You know what I want better than I do." I told him I would let him have it at the same rate I sold the carpenters. That settled him, and I showed him just what he was going to get. He drove into the yard and I loaded him with the first load of it. I distinctly remember this case for I noticed how pleased he was to think he could buy as cheaply as the carpenter. If we could always have this type of customer to deal with there wouldn't be the variety of experience there is in the retail business.

A Difference in Different Localities

Bill selling is easy in some towns compared with what it is in others owing to the difference in the class of customers. I always think of this when I read the letters of the correspondents in The Lumberman telling of their experience with mail order competition. Some places they have very little bother. In others the dealers are pestered with a lot of fellows sending away to get figures just to see how much their home dealer is trying to "gouge" them, as they call it, when talking about it among themselves, but in talking with the dealer they explain their action by saying they just wanted to see how near the figures would be alike.

A dealer wrote me recently of a case of this kind that he had been laboring with. His next door neighbor was going to build and came to him for help to make out the list of stuff he would need and get the benefit of his advice and judgment in planning, and the kind of materials to get. Naturally he thought that because he was his neighbor and their wives talked over the fence together after the men had gone to work, there would be little difficulty in selling the bill and getting a reasonable profit out of it. So my friend rested easy in his mind and expected every day to have his customer tell him to begin delivering on the job, but, alas and alack, for the victim of neighborly confidence. A week or so afterward, a carpenter let him know that his friend had been sending off and getting figures from several of the direct-to-the-con-fellows, and they had beaten him badly on prices. A direct-to-the-neighbor interview was had without much delay. The man admitted the impeachment of trying to see how near his friend, the confiding dealer, would come with his figures to theirs. It was only a little matter of \$200 difference against him, and, "of course," he said, "you will let me have it as cheap as they can." I

know my friend to be a good Christian man, but I am pretty sure he framed a few cuss words in his back thought over the cunning trick that had been played him. He sold the bill, of course, but at a profit of the cost of handling, figuring his own wages at a dollar a day. After several disappointments of this kind in my own experience, I became hardened and got so that I never counted on a bill until I had sold it and made the first delivery. Furthermore, I learned to be a good loser. But it was many years before I attained to this measure of grace and as I look back on the times when I was foolish enough to get mad and stay mad for some time because I failed to sell a bill to one I thought was my customer, I can but regret that I was so foolish and short sighted.

Nothing Worth Worrying About

This is something that a young dealer, or any one for that matter, should guard against, for it not only causes himself unnecessary worry over what can't be helped. It has the effect to lose him trade as well and besides it puts him on the same level as the lost customer who instinctively thinks that you will cherish a "grouch" against him for not giving you the bill. I know it is a most difficult thing not to harbor a resentment against both the expected customer and the competitor who has beaten you in the contest for the prize. It is human nature to be disgruntled over a lost bill, and not to be is a condition of feeling to be cultivated. A poor loser is sure to create a condition of feeling against himself. Even his friends to whom he relates the circumstances of his loss will have little or no sympathy for him, but rather, will have a lower opinion of his business ability.

There is another thing also in connection with lost bills that is a common tendency with some dealers, and that is the going round to the party who has bought his bill at the other yard and telling him if he had come to see him again he would have made him a lower price, as he had discovered he had made a mistake in his figures, or in some other way to try to make him feel dissatisfied with the bargain he has made. To say the least, and be conservative in expression, anything of this kind is contemptible in the extreme, and any man of any conscience at all can't help but despise his own action.

I am fully aware, however, that in the earlier days of the retail lumber business, this was a common practice among the dealers. It was a part of the business warfare that was common then. To harass a competitor and make him all kinds of trouble was considered a part of the game and I confess that I was guilty of doing my share of it at the time. But with the organization of our associations, came a better spirit in the trade. We learned that there was such a thing as ethics in business.

As I look back and compare those times with the present, I realize how great the influence of the associations has been in civilizing us in our relations with each other in competitive business. I say this, you understand, in a general way, for I appreciate the fact that there are a few sinners in this respect in the business today and probably there will always be. But I believe the greater number of dealers have come to regard the old tricks of business unworthy of their honor and dignity as individuals and business men. So I say to my friends among the younger dealers, when you go after a bill, do your best to land it, but let your actions be legitimate and governed by the ethics of honor, and good feeling toward your competitors. If you are unsuccessful, don't go round "belliaking" over it, and advertise your ill-temper and lack of ability, for if you do, it is bound to react against you in the public mind and estimation.

The Personal Equation Counts

The personal equation enters a good deal in the selling of bills. One dealer will influence a customer to buy a bill of him, that another dealer stands no chance with, and sometimes this personal influence is strong enough to overcome the lower price that is offered by a competitor. On the face of it, this may look strange to one not experienced in such matters, but I think every old dealer will bear me out in the assertion and can remember when he himself has done the same thing and felt more than usual satisfaction over the occurrence and the compliment to his salesmanship. Such cases though are apt to give rise to some feeling on the part of the competitor, who thought his price was low enough to secure the bill. He will suspect that either his figures have been beaten, or some other inducement offered to his disadvantage. He will attribute anything, however, but the real reason because he don't understand it.

A margin should be given for the operation of this difference of personal influence which each has in dealing with different individuals. It won't do to ignore it, because it is one of the natural facts of human life. You and I are governed by it every day of our existence and it manifests itself in the preference we give in our relations with others. We can't explain why we favor one person more than another, but we do. There are one or two travelling salesmen that you patronize more than the others who call on you who you have no reason to doubt will sell you as good grades and give as good service as those you favor most. You may go to the extent of saving up your orders for the favorite salesman. If you are married

and have children you know you love them all, but there is one of them that you unconsciously favor more than the others. It is one of the girls. She "twists you round her finger" and you are not aware of it. One party can get a subscription from you that you would promptly turn down if someone else approached you for the same purpose. These are but a few of the illustrations that could be named to show how strong a factor this personal equation is in the governing of human action.

Inducements That Turn the Scale

It is an old trick in bill selling to offer a little bonus to turn the scale of decision in our favor when the balance of offers is about even. It is not in the form of money, of course, but it is a bonus all the same. Some of our good friends and regular customers, when going to build will tell us they expect to buy the bill of us, but in order to be fair to the other dealer who has asked them the chance to figure on it and which they promised him they would, they will have to, out of courtesy, do as they agreed. This puts us in a sweat of apprehension lest our friendly competitor may allow his business instinct to thwart our intentions to get a fair profit out of the deal, and so we figure a little lower than we would have done, if we had been sure that our customer was not going to get figures elsewhere. He comes back smiling from the other yard and we watch intently the expression on his face to try to divine whether the result is for or against us. If we are successful in prevailing on him to tell us there is not much difference in the bids, we may be pretty sure that our bid is the highest for if it was the lowest he would have been more apt to say right off that we could have the bill. At least, this has been my experience in this kind of a sweating game, and it is a point well worth remembering when you are in a similar fix.

Acting on this supposition and not liking to cut the figures first given, you intimate, if he will conclude the contract, that you will give him a better grade of flooring than the bill calls for, or something else of that character that is better than you had figured. One of our favorite offers of this kind was that we would let him have a more expensive front door. That would please his wife more than the plainer one on the bill. If there is not too much difference in the respective bids, these extra inducements generally turn the scale in our favor, and we have a chance to "save our face" in saying that we didn't cut the original figures we made on the bill. You know, sometimes our competitors will get after us with the charge that we are cutting prices, and this is one of the ways that we dodge the impeachment. Strictly speaking, I suppose it is hardly the fair thing to do with a friendly competitor.

But there are some cases where it is a personal matter between you and your friendly customer, as for instance, some farmer has been trading with you for a number of years, and bought all his lumber and coal of you during that time. You have grown to become personal friends, and you feel a sense of obligation to him for such a continuous patronage. Now when a matter of this kind comes up between you, you see an opportunity of showing your appreciation by making him a present of something he didn't expect to get. There may be a little selfish feeling in giving a present this way, but when you come to simmer it down, the giving of presents is to repay obligations, or for the purpose of inducing a return action of a like character. It is human nature to expect something in return for what we give.

Dealing with farmers as a class is somewhat different from dealing with cold-blooded business men. A man of the latter type may be in a social way one of your best friends, but when it comes down to a business deal he will hold you to a strict observance of purely business principles, and ignore anything in the nature of sentiment. But social friendship with a farmer means a business friendship also. He does not separate them as a business man does. If he likes a man well enough to count him as a friend his business goes along with his liking.

A Valuable Asset

It is this feature in country business life that very often is a valuable asset to the business man of mediocre ability. I have known several instances where men were kept on their feet because of their personal friendships with a host of farmers, who kept on giving them their business irrespective of their poor standing with the wholesale trade. Their credit might be poor away from home, but their farmer friends didn't know of it, and if they did it wouldn't have affected their loyalty to their personal friends. There are dealers who have such a hold on the farmers' trade in their locality that it cannot be shaken off even though they have fierce competition. This is the reason why some managers command a salary above the average. They are "solid" with the farmers, and if they left that yard a good deal of its trade would leave too, because personal friendships are not made in a day, and the new manager might be of another and different temperament and therefore would have to make his own personal following among the farmers.

I have dwelt at some length on this subject, because some young

dealers may entertain the notion that the mere knowledge of lumber, and the ability to figure the price is the main thing of running a country yard successfully. A few years will discover their mistake if they do. I know of a young man who is barely twenty-one years of age, who worked several years in the city yards and tried to run one out in a suburb but failed. He got a job as manager of a yard in a small country town and such was his faculty for making friends with the farmers around there, that he has built up a large trade and is now getting a salary of \$125 a month, with an additional share in the net profits.

Strong competition, causes us to do some things in the selling of bills that we would prefer not doing if we could help it. I have spoken of some of them, but I want to say a few words on the subject of getting the other fellow's figures. Nothing is easier than to cut below a competitor's figures if you know what they are. The difficulty is in finding out. Some dealers have a faculty for worming them out of a customer against his inclination not to tell. If you ask the average customer point blank what they are, his cupidity is at once aroused and his dickering propensities come into play. You have yourself made the suggestion to him to get you to make a lower price, and then go back to the other fellow and induce him to do the same. He takes the implication that you are in a strong rivalry with the other dealer, and it is to his interest to take advantage of it, as a rule. It is poor policy to let a prospective customer think you expect he is going to get the other yard to figure on his bill. It is a better way to talk and act as though you know he will buy it of you. It is safer though not to talk too much. If he is inclined to talk on the subject of the bill, let him do it, and confine yourself to answering his questions. And don't promise too much either, for in refraining from this you thereby avoid unpleasant complications in the delivery, and settlement for the bill.

C. H. KETRIDGE, in the Mississippi Valley Lumberman.

Miscellaneous Items of Interest to Lumbermen

R. J. Glanville, who has been Secretary and Sales Manager of John Hanbury & Company, Vancouver, has returned to the Wheeler, Osgood Company, of Tacoma.

The cut of logs on the Upper St. John during the coming winter is expected to be at least equal to that of last year and possibly greater, according to recent reports.

Mr. R. S. Waldie, of the Victoria Harbor Lumber Company, Toronto, has been elected president of the Toronto Paper Company to fill the vacancy caused by the resignation of Mr. G. P. Grant.

In another part of this issue there appears an interesting article from the pen of Roland D. Craig, forest engineer, Vancouver, describing a recent trip through the valley of the North Thompson River, a little known region through which the line of the Canadian Northern Pacific Railway will pass on its way to Kamloops. The country is heavily timbered, and will, in the near future, yield a large revenue to the British Columbia government.

Dr. H. M. Whitford, on behalf of the Conversation Commission of Canada, is now in British Columbia, commencing the work of estimating the forest resources of the province. Dr. Whitford's task consists of gathering all the available information concerning the forests, for the purpose of ascertaining their nature and value. This may occupy him for a year or more, the intention being to have the work done more thoroughly than ever before. The Commission of Conservation is gathering information of this nature regarding the whole Dominion of Canada.

A. E. Frank, secretary of the Mountain Lumbermen's Association, Calgary, Alta, in a recent interview stated that the excellent crops harvested on the prairies this year will mean a great improvement in trade conditions, for the lumbering industry of British Columbia. Stocks in prairie yards, he says, are very small, and a slight demand would result almost immediately in a call on Mountain lumbermen to ship out lumber. Stocks in British Columbia yards, he says, are also small, as many of the mills have been shut down during part of the past season.

The receipts of the Forest Branch of the British Columbia government for the month of July reached a total of \$218,660.73, of which amount \$12,209.73 was credited to the Forest Protection fund. The detailed statement of the revenue received during the month follows: Source—Timber license fees, \$149,114.06; timber transfer license fees, \$2,145; timber license penalty fees, \$1,400; timber lease rentals, \$1,916.05; timber lease transfer fees, \$40; timber mark fees, \$131; hand-loggers' fees, \$1,175; scaling fees, \$2,763.25; scaling expenses, \$248.15; timber royalty, \$38,492.50; timber tax, \$3,905.82; timber bonus, \$4,323.49; exchange, \$2.98; interest, \$738.70; scalers' examination fees, \$55. Total \$206,451.00. Forest Protection Fund—Timber licensed lands, \$10,936.24; timber leased lands, \$128.59; crown grant lands, \$1,144.90. Grand total \$218,660.73.

From Kamloops to Tete Jaune Cache

Description of Forest Conditions in Valley of North Thompson River Along the C.N.P.R. Route

By Roland D. Craig, F. E.

During July the writer made the trip from Kamloops to Tete Jaune Cache along the route of the Canadian Northern Pacific Railway, now under construction. For the information of those not familiar with the route, it may be mentioned that the railway follows the North Thompson River about 175 miles, thence up the Albreda River to its source, down Camp Creek and across the Canoe River, and from there through the low Cranberry Lake Pass to Tete Jaune Cache, on the Upper Fraser River, from which point it parallels the Grand Trunk Pacific through the Yellowhead Pass.

The distance by the railway line from Kamloops to Tete Jaune Cache will be approximately 225 miles, but by trail it is nearly 275 miles. Until recently this part of the province has been very little known, owing to the difficulty of getting through the country. In 1875 the engineers of the Canadian Pacific Railway surveyed a line and cut a horse trail through this valley, but with the selection of the Kicking Horse Pass route, the North Thompson was abandoned and until the Grand Trunk Pacific and Canadian Northern Pacific railways sent their engineers through in 1909 the trail had been traversed only by a few cruisers and prospectors. Even the Indians avoided the Upper North Thompson River, preferring the Fraser or Columbia rivers as trade routes. The Canadian Pacific Railway is therefore opening up a new country which heretofore has been entirely unproductive.

Good Timber and Farming Land

The climatic conditions and, as a result, the forest conditions, change very much as one proceeds north. For the lower seventy miles the country has the characteristics of what is commonly called the Dry Belt. The timber is chiefly bull pine and fir growing in parklike stands, with little or no underbrush. The mountains are lower and less rugged than further north, and the valley bottom is broad, being from one to two miles wide in places. These bottom lands are very fertile, and when cleared and, where necessary, irrigated, they are certain to be very valuable for agricultural purposes. Throughout this drier district fires have destroyed large areas of forest, and only the fire-resisting fir and pine are left. North of this the climate becomes more moist, and the forests more closely resemble those on the Coast. Cedar, spruce and hemlock, with scattering white pine and fir become the prevalent type. For the first forty miles of this cedar-spruce type the fires have destroyed most of the old stands, but a vigorous reproduction is coming up which, if protected, will in time be of value.

The main stand of merchantable timber occurs in the next sixty

The fir, too, is smaller than on the Coast, but it is of good quality, and the white pine is exceptionally choice.

From the Albreda summit north to the Fraser River the valley broadens out to three or four miles in width, but there is practically no timber of value, the ground being covered with small jack pine which has been burned over many times. There is at least fifty square miles in this vicinity which is practically flat, but which, owing to the gravelly nature of the soil, will be very little use for agriculture, with the exception of some small patches where there is a little clay loam.

The North Thompson River

The North Thompson River ranks with the Columbia and Upper Fraser rivers in size. The drainage area is approximately 8,000 square miles. The river is navigable for large flat-bottomed steamers for 86

Canadian Northern Railway Sawmill at Barrier River

miles, but above this point with the exception of about 20 miles through Stillwater Flats, it is too swift for navigation. It is, however, an excellent stream to drive, for with some improvement in the canyon at Hell's Gate and the stringing of booms across the entrances to a few shallow sloughs, there will be no difficulty in sending down logs from Albreda river to Kamloops Lake.

There are few mill sites on the river suitable for large mills but there are many locations for the placing of small mills along the railway line. With the completion of the railway it will be possible to get labor and supplies into any part of the valley very easily, and with such excellent driving facilities the exploitation of this timber can be accomplished cheaply. The winter climate is such that horses and sleighs can be used to good advantage in logging, and the period of high water in the spring and early summer is long enough to allow the handling of a very large log drive without danger of "jams" occurring on the river.

From my observation I would estimate the total stand of timber

Where work the Pioneers: Tete Jaune, Upper Fraser River

miles, extending from near Hell's Gate to within a few miles of the Albreda summit. In this belt there is very little evidence of fire, due, no doubt, to the large amount of rainfall and also to the fact that there has been very little travel in this district. The valley bottom is narrow along this part of the route, but in the main valley the timber extends about a mile on each side of the river, and follows up the tributary valleys in places for several miles. The mountains flanking the valley are high and many of them are capped with perpetual snow. Enthusiastic Alpine climbers will here find a very interesting field of exploration.

The cedar in the Upper North Thompson Valley grows to a very large size—often to eight feet in diameter. The spruce is not so large, but is tall, clear timber, which will yield a high grade of lumber.

tributary to the North Thompson at about 2,000,000,000 board feet, which will yield the government one million dollars in royalty alone. In addition the annual ground rent which will be paid by license holders will amount to another \$500,000, so that the government has a direct interest in protecting this timber to the extent of \$1,500,000. The province will indirectly benefit to the extent of another \$15,000,000 in wages paid for the exploitation of this timber. The interest of the Canadian Northern Railway in this timber should not be lost sight of, for it will mean, at the lowest calculation, \$10,000,000 in the matter of freight. It may be pointed out, too, that the timber is practically the only local source of revenue which the railway will have through this part of its line.

It behooves both the government and the railway, therefore, to

use the utmost diligence in preventing forest fires from destroying this valuable asset. Railroad construction is one of the most hazardous operations to the surrounding forests, as has been demonstrated in the building of every line in Canada. This is due largely to the practice of letting clearing contracts to irresponsible sub-contractors, whose only interest is in getting their short stations of work done as quickly and cheaply as possible. Only close and constant supervision by forest rangers can prevent carelessness in this connection.

It may be mentioned that the Forest Branch of the provincial government has quite a large force of patrolmen at work, but if the season had proved a dry one it would have required at least twice the number of men to properly safeguard the timber. Fortunately, however, though there was some damage done, the rainy weather has prevented any very serious fires.

Railway Sections Being Linked Up

It is of interest to know that the British Columbia section of this great transcontinental line, the Canadian Northern Pacific, is nearing completion and will doubtless be in operation in 1915. The steel is laid from Port Moody to beyond Yale, and the grade is practically completed to Kamloops with the exception of some bridges. Steel

Cedar and Spruce on Monarch Lumber Company's Limits

is also laid up the North Thompson nearly 80 miles, and the grade well under way for another 40 miles. From Yellow Head Pass the grade will be ready for steel to the mouth of the Albreda this fall. This leaves a gap of only about 60 miles to be closed up next year.

That the completion of this line will be of great benefit to British Columbia there is no room to doubt. The city of Kamloops and the North Thompson Valley will be particularly benefitted, as plans are being laid for very extensive lumbering operations as soon as the railway is completed.

B. C. Intends to Increase Royalty

Believes Public Entitled to More than 50 cents per thousand feet—Forest Branch Notes on Timber Administration

H. R. MacMillan, Chief Forester for British Columbia, in a recent interesting report, says:—"I have just returned from a series of meetings which have been held by the Minister of Lands to discuss with the lumbermen and timber owners of the province an equitable system which might be adopted for the increase of the rates of royalty charged on timber cut from Crown land. It is purposed to increase the rate of royalty as it is believed that the timber now being logged is worth more to the public than the 50c royalty now collected.

"Many different systems of increasing royalty were brought forward by the lumbermen, among them being the grading of the timber and the increase of the rate on the high grades and the collection of the royalty as a percentage of the value of the timber sold. At these meetings opportunity was taken to discuss with the lumbermen the fire protection work of the Forest Branch and arrangements were made to have the timber owners of the province appoint advisory

committees who would work with the Forest Branch in improving and supervising the fire protective work.

"The past fire season has been most successful. The Forest Branch has had at work 415 men in addition to 60 men who are employed by the railroads under the supervision of the Forest Branch. The expenditure for patrol has been over \$200,000, the highest expenses per month being about \$50,000. Arrangements were made for the employment of 100 extra men through the fire season, but owing to the weather it was not necessary to call out this emergency force. Thirty-seven boats were used by the Forest Branch in fire protection this summer.

Improving Fire Protection System

"Improvement work is being carried on throughout the province and at the present moment nearly 600 miles of telephone line are under construction and 1,200 miles of trail. Most of this is being paid for from the fire protection fund. In some cases lumbermen are contributing towards the cost of work which is being carried on by the Forest Branch. The most notable fire protection improvement under construction is the cable telephone line connected with the heavily timbered islands between Vancouver Island and the mainland north of Vancouver in which district is at present the heaviest timber cut in Canada, the output over a small area being about one billion feet per year; also a telephone line which has been constructed to a lookout point on the summit of Mount Baker near Cranbrook; this line reaches an altitude of 7,200 feet and is believed to be the highest telephone point in Canada. From its terminus may be secured a view of an area of over 2,000 square miles in the water-sheds of the Columbia, Kootenay and St. Mary rivers. A lookout will be stationed at this point throughout the fire season and will be able to send to the office of the District Forester at Cranbrook first intimation of any fires occurring in the most valuable timber holdings of the Crows Nest District.

"A complete system of trails and lookout points connected with telephone is being completed in the irrigation districts around the Okanagan Lake, this system will be perfected this fall and should prevent any further fires in the important watersheds in this region.

"Arrangements have recently been made whereby the Forest Branch undertakes the inspection of lands before they are open for settlement in order that timbered and non-agriculture lands may be kept in reserve for forest purposes. About a dozen or 15 parties are now in the field engaged at this work. All lapsed timber licenses and leases are examined by the Forest Branch before action is taken towards their disposition, and all areas on which there is merchantable timber or which are unfit for agriculture are reserved for forest purposes.

"The fire season which is now about over in the province has resulted very favorably. There are about 1,800 miles of railroad under construction through timbered land in the province. Construction was carried on clearing right-of-way and working the timber through the summer and although a large number of fires were started they were all extinguished by forest officers before any damage resulted. The total area burned over by fires starting from railroads under construction was less than three square miles, similarly fires resulting from operating railroads were kept under strict control.

Impending Timber Sales

"The Forest Branch still continues to receive applications for the purchase of small areas of timber; eight parties are now in the field cruising timber for sale. During the past two or three months the dullness of the lumber business has interfered with logging on several of the timber sales and has made it advisable to delay the completion of pending timber sales if the timber is to be sold for its possible market value. The largest transaction now pending is the sale of 500,000,000 feet of timber, chiefly hemlock, to the B. C. Sulphite and Fibre Company for the manufacture of chemical pulp, the cutting period on this sale will be between twenty and thirty years and the officers of the Forest Branch are finding it difficult to devise a system of revising the stumpage price periodically in order to protect the government interests and to be fair to the company. A very careful examination is being made of the tracts to be cut over in order to render possible the framing of regulations which will protect and encourage the reproduction of the forest. This sale, when completed, will embody practically all forest regulations and should be of interest in Eastern Canada where sales of pulp timber to companies are frequently taking place.

"All logging operations in British Columbia are carried on under authority from the Forest Branch. In order that forest officers may keep in sufficiently close touch with the work in the different operations, prevent trespass, undue waste and illegal handling of timber, instructions have recently been issued to have all logging operations inspected at least once in three months and reported to the Chief Forester."

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Culls Wanted

Culls and Outs in White Pine, Red Pine, Jack Pine or Spruce.

The Elgie & Jarvis Lumber Co., Ltd.,
20 18 Toronto St., Toronto, Ont.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Wanted Building Lumber

To sell by active man, middle age, practical experience selling building lumber and hardwoods. Thorough knowledge of credits and collections. Efficient and competent to handle large transactions. Now employed selling in New Jersey and Eastern New York. Want a position offering opportunities for advancement. Address Box 836, Canada Lumberman, Toronto, Ont. 15-16-17-18-19-20

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4 1/2 in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

Hardwood Pickets Wanted

Beech, Birch and Hard Maple.

1 x 1 x 42.
1 x 1 x 48.
1 x 1 1/2 x 42.
1 x 1 1/2 x 48.
1 x 1 3/4 x 42.
1 x 1 3/4 x 48.

Require Thickness, 1/16-in. Plump.

Quality—Free from all defects.

Can take delivery of green or dry stock.

Apply to The Canada Wood Specialty Co., Ltd., Orillia, for full particulars, price, etc. 24-1-TF

Wanted to Buy

We are in the market to buy the following lumber:

1 carload 1 1/2-in., 1s and 2s, dry quartered Rock Maple, 5-in. and up wide, 8/16 ft. long.

1 carload Rock Elm.

Also Hickory squares, as follows:

100 gross 26-in. x 1 1/2-in. first growth.
1 car 26-in. x 1 1/2-in. second growth.
1 car 26-in. x 1 5/8 x 1 5/8-in. sec. growth.
5 cars plain white Oak, various dimensions, 6-in. and up wide.

2 cars Rock Maple, various dimensions, 6-in. and up, average 9-in.

Rock Maple logs, 20 to 23-in. diameter at small end.

Rock Maple logs, 24 to 30-in. diameter at small end.

White Ash logs, 10 to 18-in. diameter at small end.

State best prices net cash. Delivery to be made as much as possible this season, balance next. Apply P. O. Box No. 1595, Montreal, Que. 16-t.f.

WANTED — Maple axles, ash or oak tongues. 2-in. oak plank in car lots or less. Tell us what you have. Jackson Wagon Co., St. George, Ont. 19-20

WANTED—36-IN. LATH. Can be White Pine, Yellow Pine, Norway, Spruce, Basswood, Poplar, Elm or Chestnut. Address Dock & Mill Company, North Tonawanda, N.Y. 20

WANTED TO BUY: One million feet 1-inch Pine Culls and 500,000 feet 1-inch Hardwood Culls. Will take delivery by water or rails. M. Brennen & Sons, Hamilton, Ont. 16-21

We Want to Buy

about 100,000 feet of 5/4-in. Soft Maple, Log Run Dead Culls.

The Glangarry Lumber Company, Ltd.,
19-20-21 Berlin, Ont.

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

SALE OF

Red and White Pine Timber

Notice is hereby given that tenders will be received by the undersigned up to and including Thursday, the 30th day of October, 1913, for the right to obtain licenses to cut the Red and White Pine timber on timber berths in the Townships of Thistle and McWilliams, in the District of Nipissing.

For maps and conditions of sale apply to the undersigned or to the Crown Timber Agents at Sudbury and North Bay.

W. H. HEARST,

Minister of Lands, Forests & Mines.
Toronto, August 23rd, 1913.

N.B.—No unauthorized publication of this notice will be paid for. 17-20

Miscellaneous

New Steel Rails for Sale, 25 and 30 lbs. per yard, with fish plates. A bargain for a quick disposal. Imperial Waste & Metal Co., 713 Queen Street, Montreal, P.Q.

Tenders for Pulpwood Limit

Tenders will be received by the undersigned up to and including Wednesday, the 31st of December next for the right to cut pulpwood on a certain area situated on the Metagami River in the District of Temiskaming.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the Crown dues of 40c per cord for Spruce, and 20c per cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario,—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario, for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into an agreement to carry out the conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,

Minister of Lands, Forests and Mines.
Toronto, Ont., Sept. 17, 1913. 20-24

For Sale

Tugboat, 65 ft. over all, 14 ft. 3 in. beam, 8 ft. deep, fully equipped with winches, 10 and 20-in. compound engines, surface condensers and pumps. All connections and pipes brass and copper. Address T. N. McGrath, Tusket, N.S. 20-t.f.

MAIL CONTRACT

Sealed tenders, addressed to the Postmaster General, will be received at Ottawa until noon, on Friday the 7th of November, 1913, for the conveyance of His Majesty's Mails, on a proposed contract for four years, six times per week each way over Cheltenham and Rural Mail Route, from the Postmaster General's pleasure.

Printed notices containing information as to conditions of proposed contract may be seen and blank forms of tender may be obtained at the Post Offices of Cheltenham, and at the office of the Post Office Inspector, Toronto.

A. SUTHERLAND,

20-21 Post Office Inspector.
Post Office Inspector's Office,
Toronto, Sept. 24th, 1913.

Good Results from High Wages

Careful study shows that the defective work does not come from the employees earning the highest wages, but from the ones who are earning the least; for, in order to earn a high percentage, the operator must be interested in his work, and doing the same operation so often, it becomes more natural to do it right than wrong. An interested employee soon finds that the work can be done fastest by always doing it in the same way, then studying the motions he makes and endeavoring to eliminate all false motion. He finds that to turn out a large amount he must have his work arranged neatly and systematically, so that he will not lose any time through false motions.—Berlin Quality

Selling to Canada Again

A New Orleans, La., despatch under recent date says: What is regarded as one of the most significant movements for many months is the clearing of four cargoes from Gulf ports last week for Quebec, Canada. Canada formerly was a heavy purchaser of long leaf yellow pine in this territory, but for more than a year has been out of this market. It is believed that conditions have become favorable again and that the cargoes that have just gone forward indicate the opening of a permanent movement.

The increased rates on pulp wood shipped from Ontario, Quebec and New Brunswick to American points go into effect on August 15. It is claimed that the new

Review of Current Trade Conditions

Ontario

Although there has not been any very great change in the lumber trade situation during the last two weeks, business seems to be steady-ing up considerably and a number of enquiries have recently been received for different kinds of both hard and soft woods in which there had been no market for a considerable time. The taking off of the duty to the United States markets will undoubtedly cause considerable improvement in the situation here. Spruce especially, is likely to benefit by this free entry and an advance in price may consequently be expected at an early date. The pine situation seems to be normal, although the middle grades seem to be moving rather better than they were a month or six weeks ago. Culls are still strong. There has been no appreciable change in the hardwood market although several enquiries have come forward for both birch and basswood. In some of the smaller towns, local dealers report a considerable improvement, many of the farmers now being able to take lumber and do the necessary building around their farms.

Eastern Canada

The most important news from the Maritime provinces during the past two weeks has been that of the conclusion of the strike of the millmen at the St. John, N.B., mills. The men have all gone back to work without any change in the conditions of their employment. It is expected that the St. John mills will cut about 50,000,000 feet before the end of the season. This will leave the total cut about 50,000,000 feet short. About 30,000,000 feet of logs will be wintered over at St. John and will be available for early spring sawing.

A few more enquiries are reported from American markets for New Brunswick stocks. Buyers are appearing in the province and report that active trade is likely to revive with the settlement of the tariff issue in the United States. Stocks on the wharves at St. John are almost nil, and no accumulation can develop before the first of November. The local demand for low grade spruce continues strong. The demand for English deals is not so good as it was a short time ago as a result of trade disturbances in the Old Country. Merchantable spruce boards at St. John are quoted at \$15.50 per thousand. English deals are quoted at \$17 on a basis of 50 per cent. 9 in. and up, balance 7 in. and 8 in. x 3 in.

The cut on the St. John River during the coming winter will be much smaller than it was last year, as a result of the large quantity of logs left over from this year's sawing operations, all of the St. John mills having been idle as a result of the three months' strike. Considerable activity is reported in the box shuck trade as a result of extensive orders for boxes for fish and apple packing. The price of boxes has advanced about 10 per cent.

Stocks of eastern spruce are moving slowly at fair prices in New York. The demand continues light, but wholesalers are not finding so much difficulty in maintaining prices. Yard buying is on a cautious basis as the building situation continues dull. Yard stocks are only fair in quantity. Hardwood trade is active at New York with quotations strong. Stocks at city yards are light and are not accumulating under present buying methods. Stocks at mill points are reported to be in good supply, especially among northern hardwood mills. Hemlock continues strong at New York, prices are holding well and although the quantity of building in the city is less than usual, there is a fair amount of building under way in the country.

Spruce dimension and frame at Boston are ranging from \$24 to \$25. Covering boards are about steady at \$23 although there are reports of sales at \$22.50. There is a fair request for 5 in. matched boards at \$25 to \$25.50, with random at about \$1 less. Water woods are declining and several vessels were waiting charter at Boston at latest reports. Hardwood prices at Boston are unchanged and business is fair, but not up to the usual fall level. The same applies to hemlock. Wholesalers report difficulty in securing orders at more than \$23.50 for eastern clipped random and some sales are reported at \$23. The business in shingles at Boston is light although there is a tendency on the part of manufacturers to hold their stocks rather than sell good eastern cedar shingles at \$3.75 for extras and \$3.50 for clears. It is not likely that stocks could be purchased at these prices now. Lath are quiet at \$3.90 for 1 7-16, and \$4.40 for 1 1/2. Some cargoes are being offered \$4 for 1 1/2 in.

Improved trade is reported from Montreal. Prices of low grade white pine, spruce and hemlock are firm, and lath are strong. Exports to Great Britain are increasing on account of the approaching close of the season.

Western Canada

Recent reports from Vancouver announce the closing down of some of the sawmill plants, following the curtailment of production by limiting the number of hours of operation each week. In spite of this situation, manufacturers are convinced that trade will improve in the near future, as general commercial conditions are already improving on the coast and the wheat crop on the prairies has been very large. The market for shingles is very dead. The cut of timber is apparently increasing and, if it is maintained at its present rate, there is likely to be a surplus in the water before long. The July cut showed a falling off of 10,000,000 feet as compared with June, and August showed an increase, the total being 66,382,150, as against 65,159,925 in July. In August, 1912, the log production was 67,582,770, but this included Vancouver Island which is now made up in a separate estimate and amount to between 8,000,000 and 10,000,000 feet. The demand for logs has not increased, as the mills are buying only for their immediate needs, which are small. Prices range from \$6 to \$10.

United States

Reports of a slight improvement in the lumber trade are commencing to come out although there is still a general feeling of hesitation regarding the immediate future. No one seems at all certain about the conditions which will prevail in the money market during the balance of the year. Some are looking for considerable trade disturbances as a result of adjusting conditions to meet the new tariff arrangements. Others expect that the removal of tariff suspense will act as a stimulous to trade. This latter feeling is fairly general. In fact a fair amount of business is now in progress if one takes the bank clearings as an indication. No real improvement is shown in the steel trade.

A fair movement of lumber is in progress which commenced about the middle of September, but even yet it is some distance away from normal. Buying is practically on a hand-to-mouth basis. Retailers, factory stock consumers, and wholesalers are not purchasing far ahead of the demand. Prices in general continue soft and irregular although there is a hardening tendency in some spots where stocks are scarce and needed in a hurry.

Considerable improvement is reported from a number of quarters in connection with yellow pine, but buyers seem still to be in control of the market. The northern pine operators, as a rule, are fairly confident, because of the favorable crop results. Northern pine trade at Chicago is quiet, and there are more enquiries than orders. Box grades are strong. The movement of lumber in the Saginaw Valley is small. Local dealers purchasing Georgian Bay stocks have apparently held back until the removal of the duty. Much lumber, however, is required. At Buffalo, the demand for low grade lumber is greater than the supply. A better market is also reported for northern pine at New York. Prices are steady. Lower prices are reported for the low grades at Pittsburg.

The hardwood market is broadening and assuming regular fall proportions. Buyers are apparently a little more anxious about their stocks. This is especially the case in regard to ash, plain oak and quartered oak. The demand for the northern woods, is not heavy, but is sufficient to care for stocks which are said to be lighter than usual. There is a fairly active movement in hemlock on all the great lake markets. The supply of hemlock is considered sufficient to meet the present demand, but that is all and manufacturers are feeling well satisfied with the outlook.

Great Britain

Continued activity is shown at the London docks. Arrivals of late have been numerous, but there has not been so much business as usual in the city. Export trade, however, continues brisk. Deliveries at London docks for the week ending September 20th totalled 5,177 standards, as compared with 8,939 standards during the corresponding week of 1912. At Churchill & Sim's recent auction sale a lot of 3 x 7 in. first Quebec spruce, 6 to 8 ft., brought £13 5s. Another lot of 3 x 6 brought £13. First quality pine from Montreal, 3 x 11 in., 16 ft., was sold at £39 10s. Third Quebec pine, 3 x 7 in., 10 to 16 ft., sold at £13.

The strike of the railway employees at Liverpool came to an end recently, but, the trade was then only commencing to feel the serious inconvenience developing from freight congestion. Large quantities of timber, deals and other wood goods which had been landed from incoming steamers had to be kept on the docks. As

soon as the employees returned to work the railway companies devoted their attention, as usual, to forwarding perishable goods. Under these conditions it is expected that it will be some time before the railways have got into proper working order once more. One firm alone, at latest reports, had as much as 600 standards of pine goods on the quay, upon which they would have to pay quay rent and other charges. This situation has resulted in a very quiet timber trade, both for spot and future delivery. New Brunswick and Nova Scotia spruce deals continue steady and there is no likelihood of alteration before the close of the season. The c.i.f. market is very quiet and shippers apparently are not realizing their expectations on these lines, as buyers are scarce. Most of the shipments are reported

to contain a large percentage of 7 and 8 in. x 3 in. and to be lower than the average quality of cargo deals. Importers apparently are not bidding for these lots and some low prices have been accepted. Latest advices are that shippers will do well to be careful about sending over consignment parcels, lest they may bring about a slump. The spot market for spruce continues fairly firm, but the demand is dull. Birch c.i.f. values are very steady, with very little business in progress. Spot values for birch are also firm. Stocks of Quebec logs are rather heavy, but St. John logs are not in excess, though ample for present consumption.

The lumber business at Glasgow continues rather slow, purchases being as a rule for immediate requirements.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John Mills all Cutting—Strikers Return

St. John, N.B., October 3rd (Special to the Canada Lumberman):—After a lapse of practically three months, the mill men's strike at this port has been broken, the men returning to work at the wages they were receiving when they went out, and with working conditions unchanged. It is felt by the mill owners here, that the men now realize from actual experience that they cannot find better pay for the same number of hours anywhere out of the city of St. John, for like work. About all the mills are now in operation and will probably continue to saw well up to the 1st of January, being well supplied with logs, and labor being more plentiful than for years past. This battery of mills will saw from 580 M. to 600 M. per day, and can therefore saw out about 50 millions of logs before the end of year. Had the mills been in operation all summer they would have sawn another 50 millions, the usual cut being about 115 to 120 millions for the entire season. There will be wintered over at St. John about 30 millions of logs, which will be carried for early spring sawing in 1914.

While the American market does not improve very fast, still, more enquiries are coming in, especially from New England points. Many buyers are now coming into this section of the country. While they are not buying to any extent, they are looking over the ground to see what stock is on hand at the mills, as they feel that, with the United States tariff settled, trade will at once revive. The yards at New England points are very bare, and, should business increase, it is felt that prices will at once go up. As yet there are no stocks to speak of on the wharves at St. John, and it will be the 1st of November before there is anything to speak of. All the lower grades of spruce are going into local consumption about as fast as made. With the new United States tariff in effect, it is felt that lower grade or refuse lumber, in addition to merchantable spruce boards, will go up in price to local dealers, as it will cause more shipping of these grades to United States than heretofore. Boston and nearby points use a great quantity of these grades. Lumbermen in this section are looking for improved business with the settlement of the tariff, especially the shingle manufacturers who have been practically shut out of the American market for some time. The tax of 50c. per M. did not allow of any great quantities going over into the United States, unless the buyers got caught and could not get them on their own side of the line. This shingle question is giving the Maine and New England manufacturers a great deal of worry as they realize that the competition will now be very keen, and, as the cedar in many cases is of a better quality in New Brunswick, and cedar logs more accessible, it can well be seen that the people of New Brunswick will probably out-do the American manufacturers, or will in any case be on an equal footing.

There are very few spruce laths for sale, and any one asking for prices for future delivery, is being quoted about \$3.35 to \$3.50 net at mills here.

English Deal Market Quiet

In the English deal market, the outlook is not as bright as it was some time ago. The strike situation in England tends to hamper business, and should there be any further tie up, especially in the cotton trades, which consume a large quantity of lumber, prices will no doubt ease up. At the present time, buyers of English deals are not quoting to any extent, as very few deals are ready at this port. Of course, many of the deals here were contracted for early in the season, and are therefore not in the market. For rotary cut deals, to be sawn during the winter outside the city, about \$14.50 per M. is being offered, which is about \$1.00 per M. less than last year. It is said that a large quantity of deals will be sawn by rotary mills in the interior of the province during the coming winter.

Freight rates to Great Britain remain very firm, about 60 shil-

lings being the standard, from St. John and Bay ports. Freights to American ports from St. John are very hard to find, as there are practically no cargoes for shipment from here, and it will be some time before any are ready. About thirty vessels are tied up waiting a chance to load and any vessels lucky enough to get cargoes are taking them at about \$2.50 to Boston and \$2.75 to New York, compared with \$4 and \$4.50 to \$4.75 at this time last fall.

Merchantable spruce boards at mills here are quoted at \$15.50 per M.; refuse boards \$11 per M.; merchantable 2 x 4 in. and 2 x 6 in., \$16; merchantable 2 x 8 in. and up, \$18 to \$20; refuse planks, scantlings and deals, \$11 per M.; English deals on a basis of 50 per cent. 9-in. and up and balance 7 and 8 x 3 in., \$17 per M.; merchantable 3 x 4 in. 5-in., 6-in., \$15 per M.; deal ends, \$14 per M. It is well to notice that the price of deal ends, which run from 3 to 9 feet in length, has advanced very much during the last few years. A large market has been opened up for this stock in South Africa and they are shipped from here on the South African boats during the winter season.

Reduced Cut on St. John River

As yet nothing very definite has been settled as to the cut of logs for the St. John mills for next season. One thing is certain, that it will be very much less than last year's, as three months' sawing was lost this year on account of the strike. On the Maine side of the St. John Messrs. Stetson, Cutler & Company will have the following operators:—Arthur L. Noble of Fredericton will cut 4,000,000 on the Upper St. John; Albert M. Currier will cut 5,000,000 above Seven Islands; Nazire Belletier will cut 1,000,000 on the main St. John; W. H. Cunliffe & Sons, of Fort Kent, Me., will cut 6,000,000. In all Messrs. Stetson, Cutler & Company will have about 15 to 16 million come off the State of Maine side, besides which they will cut on Tobique River in New Brunswick, about 12 to 15 million for St. John, which will bring their total cut up to 35 millions of spruce, pine and cedar.

Randolph and Baker will cut on Green River in New Brunswick, about 12 million, which, along with 5 million hung up last year, on Little Black River by John E. Dickey, will make a cut of about 17 million or more. John E. Moore will cut, on Salmon River, 10 million or more. Chas. Miller will cut 3 to 4 million on the Tobique.

The building trade at St. John still continues fair although much of the smaller work and some of the larger buildings have been finished.

The box shook trade is taking on new life as the fall orders for the fish and apple trade are coming to hand. A very large catch of fish has been made on the New Brunswick coast and these are now being made ready for boxing up, while the apple crop is very short all over the country, still, more box packages are being used by the sellers than before, as they find they receive better prices for packing their apples this way. The prices of boxes have advanced about 10 per cent., due largely to higher cost of manufacture, and prices for raw material having gone up.

Better Trade Conditions at Montreal

Montreal, October 8th (Special to the Canada Lumberman):—More business is passing in the lumber trade, and although the revival is nothing out of the way, there is a general feeling of optimism. Prices hold firm on low grades of white pine, spruce and hemlock, while lath is strong owing to the advance in New York, induced by the shortage consequent on the strike in St. John, N.B. Wholesalers doing a local business still complain of the difficulty of collections.

The spring trade should be exceptionally good. There is an enormous demand for houses and flats which is not being adequately met, and as the population is increasing at a great rate, the scarcity is becoming acute. The needs in this direction must be supplied, with a consequent increase in the demand for lumber. Last month

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

the building permits were valued at \$2,146,018, a decline of \$146,495, as compared with September, 1912. From January 1st to September 30th, the total was \$15,816,018, an increase of \$2,488,952 over the corresponding period of last year.

Now that the United States' tariff has been settled, lumber which was held up is being shipped at a great rate. While the Bill was under consideration there was a large amount of shipping tonnage available and freights were low; but with the passing of the measure the room is being rapidly taken and rates have advanced. The abolition of the duty will, in the opinion of lumbermen spoken to, stimulate exports to the United States greatly, and may possibly be the cause of higher prices in the Dominion.

As the end of the season approaches, exporters to Great Britain are rushing forward with their shipments. A considerable amount of birch is being sent to the other side, but a falling off in the total of other lumber must be expected.

The ground wood market has gained considerable strength owing to the continued low water in Quebec and Ontario and in New York State. Much less pulp has been made all round, and stocks are being rapidly depleted. The amount of rainfall possible between now and freezing-up time is in all probability too small to admit of normal water conditions very far into the winter; in other words, low water is expected, and this spells scarce and high-priced ground wood.

Chemical pulps, both kraft and sulphites, bleached and unbleached, have been made free into the United States irrespective of the wood from which the pulps are produced. This leaves the market in a strong position, although there is an ample quantity produced to take care of Canadian business and for shipments into the United States.

News print should stiffen in price, in consequence of the dry weather conditions already referred to, which will result in the curtailment of the output.

Tonawanda Enjoying Renewed Activity

North Tonawanda, October 6th (Special to the Canada Lumberman):—Exceptionally favorable weather for building is given as the reason for a greatly increased volume of business in all departments of the lumber and wood-working trades at the Tonawandas. Orders are coming in more freely than for several months and there is a general feeling of optimism over the outlook for the next few months. In fact, even better things are expected in the near future when buyers cease their hand-to-mouth purchasing. Although business is so much better it is practically all small purchases and possesses none of the characteristics of a normal market. When business totals up better than usual under such conditions, it is bound to be better than ever when things get back where they should be. The new tariff schedules are not directly affecting local lumber prices. The removal of all duty from rough lumber has been anticipated for months and there was scarcely a ripple at the Tonawandas when President Wilson signed the tariff bill that permits Canadian and other foreign sawed lumber to come in duty free. Everybody on this side of the line is apprehensive of the removal of duty on dressed lumber and siding and it is freely predicted that local mills for dressing lumber will be a thing of the past within three years.

State Engineer Bensel, of New York, has warned the Niagara Frontier to be on guard against Canada's preparations to divert the shipment of lumber and grain to a more northern route via Toronto or Montreal. With the Canadian government spending \$40,000,000 on the new Welland Canal and \$15,000,000 more on improved terminals at Toronto and Montreal, Mr. Bensel says it behooves western New York to take efforts to offset the Canadian campaign for getting business.

Lumber receipts at the Tonawandas by vessel during September were large but did not reach the total of the corresponding month in 1912. Canadian lumber was particularly scarce among the cargoes unloaded at local docks during September. The official figures for September receipts are 47,376,900 feet at both Tonawandas. The report for September also shows 649,567 pieces of lath and 22,684 posts received. The last week of September showed much the heaviest receipts of the month and with steady receipts so far this month the showing for October should be exceptionally large.

The removal of the duty on lumber will mean a great loss of revenue to the Federal government. At the Tonawandas alone last month \$15,000 was collected on Canadian lumber and the month was a small one for receipts of Canadian stock. Under the new schedule Canadian carriers will arrive and clear from the Tonawandas the same as American boats. Lumbermen say that Canadian docks are piled high with lumber that awaited the signing of the new tariff bill. A good share of this stock waiting at Canadian points of shipment will come to the Tonawandas.

In order that there may be no delays in the unloading of lumber craft at the Tonawandas the number of men in the gangs that unload lumber boats has been increased from thirty to forty each. About

250 lumber handlers are constantly engaged in piling lumber on the docks at the Tonawandas. The men average as high as \$50 a week during the season.

Shippers of lumber by Erie Canal are pleased with the announcement that the canal will be kept open until December 1st.

The Barienger Braking Device

Ryther & Pringle Company, Carthage, N.Y., have published a very attractive and interesting booklet describing the Barienger Braking Device which they manufacture. This unique and useful device was primarily designed for the purpose of assisting heavily loaded sleighs, guided by horses, in the descent of steep hills and mountain roads. It consists of 4 cast iron grooved wheels or sheaves mounted horizontally and turning on large steel posts extended through the frame of the machine, the top of which is covered throughout by a sheet of steel plate $\frac{5}{8}$ in. thick. The frame is built of oak timbers of generous dimensions and for use in winter, where snow is common, is shod with steel runners. The frame may be mounted on wheels for use in localities where snow and ice roads are not available.

The under faces of the sheaves are of chilled grey iron, ground to a smooth friction surface. When not engaged, these sheaves run free on the large steel posts, supported by heavy coiled springs and lubricated by grease cups attached to each sheave. The operator, by a slight movement of the levers, is able to bring the friction surface of the sheaves into contact with a series of hard maple blocks mounted in a cast-iron frame and secured to the bed of the machine. The winding of the wire cable on the sheaves is such that, when the friction surfaces are engaged, it is impossible to move either the sheaves or the cable until the operator releases the contact of the friction surface. When the lever is reversed the friction contact is automatically released and the load is easily started.

A series of guide wheels mounted on the front of the brake serve as leads for the cable, guiding it to and from the grooved sheaves.

Each lever controls two sheaves, thus affording two separate and practically independent units to each machine. All experience during the past season however, failed to show any loads that could not be held on any grade by one lever controlling two sheaves. The additional unit is provided however, as a safety factor and to avoid stopping operations in order to change the wooden friction blocks as is necessary from time to time as wear takes place. Experience shows that the set of blocks furnished with the machine will last an entire season. A complete set of new blocks can be replaced in less than an hour.

In operation the brake requires a single strand of $\frac{5}{8}$ in. wire cable of a length equal to 100 feet plus the length of the longest hill. The cable works from both ends and each end is provided with a specially designed curved end hook, so that the hitch to the load is quickly and securely made with one end, and the descending load returns the opposite end of the cable to the brake in readiness for another load. Roller posts set in an up-right position make it possible to use the brake on long winding roads.

In cases where the length and bends of the road take the load beyond the sight of the man on the brake, a signal system is used consisting of two parallel lines of telephone wire strung along the side of the road on trees. The driver carries a light pole with a bent wire in one end by which he reaches the two parallel wires and makes a circuit which rings a bell.

The booklet describing this interesting device is very attractively published and contains photographic illustrations giving a splendid idea of its efficiency.

The same company in their catalogue No. 2 describe, by means of splendid illustrations and interesting descriptions, their excellent series of wood preparing machinery for ground wood and chemical fibre mills. These machines are known wherever wood preparing machinery is in use and have established a reputation second to none. Catalogue No. 2 is a valuable publication for all who use machinery of this nature.

Interesting Cling-Surface Pulley Test

An interesting booklet giving results of tests made upon belts which had been treated with Cling-Surface and belts which had not been so treated has been published by the Cling-Surface Company, 1032-1048 Niagara Street, Buffalo, N.Y. The tests were made by Robert Thurston Kent, Jr., Mem. Am. Soc. M. E., assisted by Wm. F. Schaphorst, Jr., Mem. Am. Soc. M. E., formerly Assistant Professor of Mechanical Engineering in the New Mexico State College. The booklet gives extremely interesting results all of which point conclusively to the value of Cling-Surface as a means of obtaining the utmost power from a pulley. It would not be possible to describe these advantages without reproducing the booklet as a whole. Those who are interested would do well to write to the Cling-Surface Company for a copy.

Fancy Woods and Veneers

THEIR ORIGIN, VALUE AND
USE—COMMENT AND VIEWS
ON AN IMPORTANT BRANCH
OF THE TRADE.

Stocks Required by Musical Instrument Industry

The piano manufacturing industry is responsible for a large consumption of various kinds of fancy woods both veneer and solid. Practically speaking an estimate of the consumption of wood by this class of industry should be extended to include musical instrument factories, thereby covering piano-players, organs, benches, stools, keys, actions, etc. In the province of Ontario during the year 1911 fifteen different woods were used by manufacturers in this industry. By far the most extensive use was made of maple, elm, basswood and pine. These woods were consumed in approximately equal quantities and taken together made up more than one-half of the total amount. Maple was used to a slightly greater extent than the other woods, although basswood and pine came very close to it in total amounts. The total quantity of wood consumed in Ontario for the production of musical instruments during the year under consideration was 12,027,000 feet B.M., of which the woods already mentioned made up the following amounts; maple 1,883,000 feet B.M.; elm 1,801,000 feet B.M.; basswood 1,640,000 feet B.M.; pine 1,595,000 feet B.M. Chestnut, tulip and birch were also used to the extent of over 1,000,000 feet each. The woods mentioned, with the exception of chestnut and the addition of gum were used for the interior parts of pianos, organs and players, including the keys and actions, frame-work and inside case-work. For core-stock, the woods used were chestnut, black ash and tulip. Sounding boards were all produced from spruce. Organ pipes were produced from pine, gum and spruce. The outside case-work, carvings, legs and mouldings were produced from oak, walnut, mahogany, cherry and Spanish cedar.

Manufacturers of musical instruments purchase only the best grades of wood and kiln-dry much of it themselves before using it in the final product. They are the largest consumers in Ontario of chestnut, tulip and walnut. Their purchases of raw material for case-work and actions are made in the form of lumber, while for frame-work, legs and posts they buy plank or dimension stock. Veneer for case-work was purchased in birch, walnut, oak, mahogany and maple. A small quantity of tulip veneer was used for cross-banding.

Two-thirds of the raw material used in this industry comes from Ontario. 7.5 per cent. is purchased in eastern Canada and 50,000 feet of Sitka spruce was brought from British Columbia for sounding boards. The remainder of the wood, 29.3 per cent., was imported from the United States and tropical countries. Piano makers pay the highest prevailing prices for their imported woods, buying the most expensive gum, mahogany and Spanish cedar. As a result of the thoroughness practised by Canadian manufacturers of pianos and organs, their product is sold all over the British Empire and in European countries. The accompanying table gives interesting details regarding the varieties of wood used in making musical instruments, their quantity, value, origin, etc.

"Sugi" Cypress—How it is Produced

One of the most interesting fancy finishes given to wood is the "sugi" finish, which was originated in Japan many centuries ago and has recently been adopted in the United States in connection with the finish of Cypress. The "sugi" finish on Cypress gives a very pleasing and interesting appearance which is specially suitable for

furniture. The process consists of burning or charring the soft summer growth of the wood and then brushing out all the charred portions. In this way the hard grain of the wood is left standing out in strong bas-relief, which has led to the use of the phrase "the wood with the chiseled grain." When the "sugi" process was first introduced in the United States all the work was done by hand, making it expensive, uncertain and difficult. Machinery has recently been perfected for doing the work and "sugi" Cypress is now turned out much more cheaply and satisfactorily. Cypress is apparently the only American wood suited to this process. The machinery consists of specially constructed burning and brushing machines. One of these machines carries a cypress board over a series of steel rollers, between which is a series of gas burners connected with a compressed air machine. This apparatus makes it possible to burn the surface evenly in a fraction of the time that used to be necessary with the use of the gasoline torch. In the other machine the burned boards are passed over a series of wire brushes of varying hardness, by means of rollers propelled by a motor. These brushes remove all the charred wood and the dust is carried away by a fan.

Birds Eyes and Burls

Every lumberman and wood worker in Canada, and most of the people of Canada, are familiar with what is known as "bird's eye" figure in maple. It is not generally known that the "bird's eye" pattern occurs in several other woods. In discussing this it is natural that one should consider also the "burl" which is widely known as the cause of most attractive figures in fancy woods.

Burls are abnormal growths or excrescences common to almost every species of tree, although in only comparatively few cases are they of merchantable character. They may arise anywhere on a tree, but those of greatest value are at the root collar, usually just below the surface of the ground.

Burls are produced as a result of some injury, such as forest fires, insect attacks, gnawing of animals, excessive pruning, etc. The effect of the injury is to stimulate the growth of dormant buds or to give rise to a great many new ones which cannot develop into branches but do form a gnarly and interwoven mass of woody tissue of very intricate design. The wood is very dense and hard. Inside the bark the surface of a burl is covered with spiny warts at the points where the buds emerge.

A dormant bud is one which never developed into a shoot or branch. Only a limited number of the buds in the axis of the leaves and the bud scales of the shoot develop, thus there would be no room for them to grow even if there were food enough to nourish them. The majority, and especially those toward the base of a shoot, persist for a longer or shorter time and sometimes for a century or more in trees with smooth bark, and only under certain conditions do they burst forth into new shoots.

In order that such buds might remain alive and not be covered up by the woody layers it is necessary that they grow in length each year just enough to keep the surface. In the center of each bud is a little cylinder of pits, and around it is a small mound of wood, the fibers of which run in different directions from the rest of the wood. When cut across, the pith of the bud appears as a dark speck surrounded by a small mass of fibers on end, producing a figure known as "bird's-eye."

In addition to these dormant buds, new ones may arise which are known as adventitious buds. If there is sufficient nourishment and conditions are favorable they will grow into shoots, but in the case of burl formation they make a short growth, die at the tip, and their places are taken by others which repeat the performance year after year. The consequence is an extremely complex nest of buds, all capable of growing in thickness to some extent but not growing out in length. In course of time this burl may attain dimensions measurable by feet and weighing hundreds or even thousands of pounds.

Burls growing on the upper portion of a tree are usually without value for cabinet work on account of defects due to insects, included bark or other causes. Valuable root burls are turnip-shaped or sometimes one-sided. They are rooted on the under side and edges, and at the place of attachment of a large root the grain is usually straight, thus detracting from the value of the burl. It requires long experience to be able to judge, from external appearances, how a burl is going to open up, and in cutting or slicing the veneer very careful manipulation is necessary to obtain the largest pieces with the finest figure.

Trees producing merchantable burls are black walnut, black

THE PIONEER MAHOGANY MILL OF CANADA

Watch this page every month and you will find something to your advantage and also read the opposite page and you may be better for it.

This is the most up-to-date Mahogany mill in America, and we are manufacturers of all kinds of fancy woods, viz., African, Cuban and Mexican Mahogany, teak, English oak, perduc, circassian, and Italian walnut, and others. Also all kinds of veneers, rotary, sliced, and sawed in all woods.

200,000 feet good dry mahogany ready to ship, all thicknesses, well manufactured and best quality wood. Send us your requirements and we will cheerfully quote.

Dominion Mahogany & Veneer Company
Montreal West, P.Q.

cherry, ash, birch, alder, oak and redwood. Walnut burls are the most sought after, and their value in the rough ranges from 10 to 15 cents a pound upward. Trees producing burls are usually rather dwarfed and stunted and grow in the open rather than in dense woods. In fact the presence of a large burl is very likely to cause the tree to be poorly developed and in a forest such trees would sooner or later be shaded out.

Burls are common on the walnut trees of Austria, Turkey and Italy, and owing to their finely mottled and beautiful figure, are much sought after for cabinet purposes. But as it was necessary to destroy large areas of timber to find the beautiful specimens, the wasteful exploitation was finally abandoned.

Almost everyone is familiar with the figure known as bird's-eye, which is particularly common in hard maple. Almost every tree of this species contains at least a few bird's-eyes, though in only a comparatively few cases are they abundant enough to give value to the wood for cabinet and furniture work. Bird's-eye is also found in birch, ash and yellow poplar to some extent, and is characteristic of lodgepole pine.

The cause of bird's-eye is usually ascribed to dormant buds, and in some instances this is correct. There are, however, at least three other causes of this peculiar formation which are usually overlooked. If the wood just beneath the bark is examined it will be found in some cases to be covered with little protuberances not unlike those of burls, in others with conical depressions or pits. The protuberances occur usually as the result of dormant buds, as in burls, although they are much fewer in number and distributed over a larger area.

Generally the surface of the wood under the bark of the tree is not uniform and smooth, but is more or less channelled or pitted. Usually only one depression is restricted to one of a few layers of growth, that is, is seen only on one or few growth rings and then lost, the surface of a particular spot being evened up by growth. In the case of maple, however, the tendency to preserve any particular contour is very great, and the depressions, though ordinarily small, are very numerous. Fitting into each pit is a sharp, spiny projection of hard inner bark which, if it did not produce the original impressions, at least tends to prevent it being obliterated when once formed. No satisfactory explanation has been offered as to the cause of this peculiarity.

Formation of Bird's-eye

It has been demonstrated by Dr. Hopkins of the United States Bureau of Entomology that sapsuckers are frequently the cause of bird's-eye. The birds sometimes puncture only to the sap-wood, but more commonly pierce one or more growth rings to procure the sugary sap which is produced at certain seasons. The formative tissue (the cambium layer which separates wood and bark) attempts to heal the wound, and a cone of wood is produced, its size and form depending upon the extent of the injury and the vigor of the tree. Succeeding layers of wood are distorted by this cone.

As a rule if growth following sap-sucker wound is vigorous, succeeding layers of wood will be bent outward over the wound; if weak, the grain will bend inward. When tangential sections of such wood are made, the depressions or elevations are cut across, and owing to the irregular arrangement of the fibers, bird's-eye figure resembling the natural formation is produced. It can usually be recognized from the arrangement of the bird's-eye in rows corresponding to the well-known type of sapsucker work in the bark. Yellow poplar-trees are very commonly worked on by the sapsucker and frequently are covered with girdles and single punctures from top to bottom producing bird's-eye, though accompanied by holes and stains resulting from the original wound which reduce or destroy the value of the wood for veneers.

Still another cause of bird's-eye is found in lodgepole pine and occasionally in other conifers. Examination of the wood inside the bark shows it to be covered with small depressions or dimples. These are produced by resin blisters in the inner bark, which press upon the cambium layer and cause the newly formed fibers to mold around them. Tangential sections reveal the bird's-eyes in large numbers, but as the irregularity of structure is not great they are not conspicuous like those in maple. Their abundance in lodgepole pine serves as a ready means of identifying the wood of this species.

Bird's-eye in hard maple is often accompanied by wavy grain, which when sawed produces a figure known as wavy or "landscape grain." This name is given it because of its resemblance to a contour map. The contour-like lines are due to the denser and darker late wood of the growth ring cut across in sawing.

Ottawa River Dams Regulating Power

Although the past season has been very dry and the level of the Ottawa River very low, little inconvenience has been caused to industries which take their power from the river, and it is hoped that the various mills will be able to carry on operations with very little curtailment of power. This is due to the fact that two big conserva-

tion dams which the Government has constructed on the Upper Ottawa are now working to full capacity. A third is now being built at Lake Quinze, which will further increase the storage. At the very low-water period a few years ago there were only 7,000 cubic feet of water per second flowing at the Chaudiere; the flow is at present about 24,000 cubic feet, or over three times as much.

New York Market Conditions Look Encouraging

Chase, Talbot & Company, New York, report under recent date as follows:—The Metropolitan lumber market has developed nothing startling, since the date of our last letter. It is perhaps conservative to state that there is an undercurrent of better feeling throughout the trade. More or less optimistic views are heard in diverse sections, mostly, however, in the nature of predictions for early spring business, it being generally accepted that the late fall trade will take care of itself. Offerings of eastern spruce, hemlock, and white pine are in minimum quantities. Yard stocks are an average of 30 per cent. lighter than at this time a year ago.

We quote spruce dimension, small stuff \$23 to \$25. 9 in. and up \$27 to \$30. Special dimension orders for exceptionally difficult long lengths can be quoted at \$2, better than these figures. Ordinary narrow random \$20 to \$23. Wide random \$24 to \$28. The latter quotation, however, is speculative, as none of this class of stock has been on recent offer. Rough spruce side boards \$20 to \$23, according to average widths. Hemlock dimension \$20 to \$23. Hemlock random \$18 to \$21. Eastern white pine box boards \$20 to \$23, embracing mostly short lengths and narrow widths. Yellow pine timber, long leaf narrow dimension \$25 to \$28. Wide \$29 to \$32. Short leaf yellow pine about \$4 per M. less than long leaf. North Carolina pine box and roofing boards have improved in price at least \$1 per M. Better grades of flooring, ceiling, etc., remain steady.

Those of the eastern lumber manufacturers, who fear the effect of free lumber, we venture to predict will be happily surprised. Prices will continue to be governed by supply and demand and with normal conditions in this and neighboring markets the eastern supply can never prove adequate.

The steel trade has already adjusted itself to the expected tariff changes. None of the pessimistic reports or all of them put together can prove that the present prosperity will not be indefinitely maintained. The consensus of opinion throughout the country in manufacturing and commercial circles is without the curfew of alarm.

A Valuable Horse Medicine

Absorbine, as a remedy for the ills that horses are subject to, is of such value as to be a requisite in all stables. This remedy has been on the market for a good many years and is constantly winning more favor among horsemen. H. G. Egbert, Flagstaff, Alta., reports remarkable success in relieving a large ankle swelling on a mare, the value of which he increased by \$50, by using Absorbine. He keeps Absorbine on hand now all the time. B. Giles, 243 St. Antoine Street, Montreal, P.Q., reports splendid results in curing swelling joints and colic in valuable horses, by using Absorbine. He now recommends Absorbine to all his friends who own horses. A free pamphlet about Absorbine will be sent to anyone who writes to W. F. Young, P.D.F., 424 Lyman's Building, Montreal, P.Q., Absorbine is sold by leading druggists at \$2 per bottle, or will be sent direct, charges prepaid, upon receipt of price.

Sudden Death of D. A. Ross, of Exeter, Ont.

Lumbermen in Ontario will learn with deep regret of the death of Mr. D. A. Ross, of The Ross-Taylor Company, Exeter, Ont., which occurred on October 6th at Clinton, Ont., where he was spending a few days. Mr. Ross had been in business at Exeter for the last 35 years, being associated with Mr. Taylor, until the stock company of The Ross-Taylor Company, was formed 10 years ago of which he was secretary-treasurer. Although Mr. Ross' health of late years had not been of the best, his associates looked forward to having him with them for a number of years. The late Mr. Ross was of a cheerful and happy disposition and will be greatly missed by his friends.

Serious Accident to J. R. Booth

Lumbermen through out Canada were greatly shocked on October 2nd to learn of the serious accident which happened to John R. Booth, the veteran lumberman of Ottawa. Mr. Booth, who is in his 88th year was superintending the removal of the ruins of a part of his plant which had recently been destroyed by fire. Without any warning, a large square timber fell upon him. His left leg was broken, his shoulder was badly bruised and the left side of his face was badly cut. Latest reports from Ottawa report however, that Mr. Booth's wonderful vitality is enabling him to make encouraging progress towards recovery. All lumbermen in Canada will hope that Mr. Booth may again be at his office in a short time and may still be spared for many years of activity.

“The proof of the pudding is in the eating”—that of belting is in the service it renders. That’s why we emphasize the fact that

The “first cost” per foot length is absolutely no criterion of belt value. The only real basis is the number of days of actual service you get out of the belt per dollar invested.

—An Important Economy Introduced

By Jas. McNoughton*

It has always occurred to me that in the loading of logs onto cars for transit by rail, with an ordinary yarding engine and gin pole, or other device, the practice of building landings is not only costly in time and labor taken in their construction but that many good logs are invariably used in making them.

It therefore occurred to me that this might be overcome by the use of a separate donkey, of a smaller type than that used for yarding, for loading the logs direct from the ground onto the cars; and that by raising the lead block of the yarder to a suitable height the logs could be piled in such a manner that they could be taken direct by the loading engine without the necessity for a landing.

I tried this out and obtained most satisfactory results, the increased output more than compensating for the extra expense for wire

ency these four might have to draw the spar in their direction. They were fastened at a height of between 75 and 90 feet from the ground on the spar tree and lead out to stumps.

As stated previously, the two machines were placed as near the foot of the tree as possible, both on the same side of the track as yarding was to be carried on, the loading engine next to the rails.

Yarding

A yarding block was hung by a chain passed around the spar as near to the guy line fastening as possible, but so arranged that the block itself was about six feet from it, hanging by the chain. This block had a 24-inch sheave with as large a pin as possible and steel separator to lessen the friction.

The yarding line was passed direct from the drum through the block then out to woods in precisely the same manner as when used in yarding to the landing, the haulback line being put out in the ordinary way and made fast to it.

I found that in using a yarding line so arranged, logs could be brought in more quickly, without sniping, and very little swamping, as the log had a tendency to raise from the ground, leadway end first, as it came in. I also found that when the log met with an obstacle such, for instance, as a stump, or rotten windfall, it rode clear over it. Moreover the line on taking a greater strain would pick it up so that it always was in the clear instead of siwashing around stumps, as is so usual in ordinary yarding. In bringing the logs to the spot for loading they are piled one on top of the other as close to the track as possible without actually putting them on to the right-of-way. In this manner logs can be piled up regardless of whether loading is going on or not.

Loading

Two loading blocks were used, one hanging from the spar tree similar to the yarding block, but just above it on the opposite side of the tree. The other was fastened on to one of the guy lines about two-thirds up so that the loading line hung plumb over the center of the track or car to be loaded. The loading line is placed direct from the drum through the block on the spar tree, thence through the loading block on the guy line. To the end of the loading line a pair of tongs was attached with which all loading was done. The weight of the tongs was sufficient to bring the line down and prevented its running back through the block. The tongs were carried to the log to be loaded, by one of the loaders, fastened to it, and from that position it was loaded directly onto the car.

The total crew used was fifteen men for all purposes and the increase in the output, in my opinion, demonstrated that this method of rigging surpasses the ordinary system. The extra expense is the initial cost of wire rope for guy lines, which is quickly made up by the saving in building landings and in the wear and tear of yarding line.

A change in position of machine is made in the same manner as from one end of a landing to the other. The yarding block remains in the same position, but the loading block is changed from one guy line crossing the track to the other of the two alluded to in the early part of this article.

In the past forty years the annual value of Canada's lumber products has increased from \$41,000,000 to over \$184,000,000, while the capital invested in the industry has grown from \$20,000,000 to \$260,000,000. Since Confederation the forests of Canada have produced \$1,321,000,000 worth of lumber.

Cadillac, Mich., is reported to be the foremost city in the United States for varied and close utilization of forest products.

A novel loading device used in British Columbia.

rope for the guy lines, while the crew remains practically the same.

The scheme I adopted was as follows:

A suitable spar tree was selected close to the track. This was topped off and at the foot of it both the yarding and the loading engines were placed practically side by side.

The spar tree was guyed by five lines to give it rigidity, two of them so arranged that they admitted of the loading block being fastened to them by two chains, as will be described later.

The general arrangement of guying was that four of the lines crossed the railway track at radii forming a semi-circle, as near as could be permitted in providing a clear way for the passage of loaded cars. The fifth guy was placed midway between the two outer ones of these four in the opposite direction or in the direction from which yarding was to be done. Thus there were four guys taking the strain of the yarding line when in action, the fifth counteracting any tend-

OPPORTUNITIES

Great Opportunities for Lumber and Shingle Mills in British Columbia

Well located choice timber at \$2 per M feet. Rough lumber sells at \$30 to \$40 per M feet. Shingles \$6 to \$8 per M. Sold as fast as it comes from the saw. Timber within one to four miles of railroad. Demand constantly increasing by reason of great immigration and enormous railroad building.

EDGINGS

Ontario

The T. Heal Woodworking Company, Limited, has been incorporated with a capital of \$400,000, to carry on business as contractors, carpenters, woodworkers, etc., with head office at Toronto. The provisional directors are W. J. Mitchell, W. S. Thomas, and Ernest Constant, brokers, all of Toronto.

The Gull Lake Lumber Company, Limited, has been incorporated with capital of \$100,000 and head office at Gravenhurst, Ont. The provisional directors are T. H. Wilson, W. H. Ford, barrister, F. L. Tate, bank manager, and W. R. Bird, Toronto. The company will build and operate mills for manufacturing by-products of wood and timber.

Barber & Colbert are reported to have completed arrangements for the location of a paper mill at Brampton, Ont. A site has been secured and a two-storey building will be commenced immediately. Mr. Barber is a son of John R. Barber, of Georgetown, the well-known paper maker, and Mr. Colbert is the former superintendent of the Barber Mills.

The Central Contracting Company, Limited, has been incorporated with a capital of \$50,000, to carry on business as lumbermen, saw millers, lumber and woodenware manufacturers and contractors in all its branches, with head office at Fort William, Ont. The provisional directors are E. R. Wayland, broker, C. E. Smith, contractor, and Dr. J. D. Chisholm, all of Fort William.

Excellent progress is reported in connection with the building for the Abitibi Pulp & Paper Company at Iroquois Falls, Ont. Between 50,000 and 60,000 cords of pulpwood will be taken out for the company this winter and will furnish sufficient raw material for the plant during the summer of 1914. Three camps have been established for cutting pulpwood on the company's reserve. At present 510 men are employed at the works and 200 in the bush. During the winter months the bush staff will be increased to between 600 and 700 men.

Eastern Canada

P. Cliche, Lake Megantic, P.Q., has commenced the erection of a broom factory.

George Rosseau, whose sawmill at Robertson, P.Q., was recently destroyed by fire intends to rebuild at once. He will be in the market for new machinery.

The Victoria Saw Mill Company has been registered, with head office at Victoriaville, P.Q. The members of the company are J. E. Alain and J. B. Jolicoeur.

The Rhodes Curry Company, Amherst, N.S., are well advanced with the construction of their new woodworking factory at Halifax, and are now calling for tenders for the roofing. The building is two storeys, 50 ft. x 170 ft.

J. D. McLaughlin, whose sawmill at Three Brooks, N.B., was recently destroyed by fire, is rebuilding the mill and it is now nearly completed. The plant will cost in the neighborhood of \$10,000.

A message from Quebec City reports the departure of a party of shanty men and contractors for Anticosti. According to the agent who engaged these men, 25,000,000 feet of pulp wood will be cut in the late Mr. Menier's island during the coming winter.

The Pointe Claire Sash and Door Company, Limited, has been incorporated with head offices at Pointe Claire, P.Q., and capital stock of \$49,000. The incorporators are A. Lesage, Z. Mitchell, J. A. E. Descelles, L. Charlebois and A. Desparois of Pointe Claire, P.Q.

The Victor Lumber Company, Limited, St. Victor de Tring, P.Q., has been incorporated. The capital stock of the company is \$20,000. The incorporators include T. Pepin, P. Fortin, N. Gagne, O. Poulin of St. Victor de Tring, and G. Lafontaine of St. Evariste de Forsyth.

A report from VanBuren, Me., states that the International Paper Company have acquired a controlling interest in the Grand Falls Power Company of Grand Falls on the St. John River. It is expected that this will mean the early development of the enormous water power at this point. Engineers have reported that the falls are capable of producing 80,000 h.p. Part of the plan is to erect a pulp and paper plant at a cost of \$2,500,000.

The Moses Haines mill at Nashwaaksis, N.B., has been purchased by Mr. A. D. Kitchen, of Fredericton, N.B., the price being the neighborhood of \$6,000. The mill was erected recently by Moses Haines and subsequently came into the hands of Mr. Alex. Watson, of St. John, N.B. The mill is located less than half a mile from the Nashwaaksis River and is equipped with modern machinery. Mr. Kitchen reports that he is in negotiation with other parties, who, he expects, will operate the mill next season.

It is estimated that the cut of timber on the Restigouche River and its

tributaries in northern New Brunswick during the coming winter will amount to about 165,000,000 feet. The Shives Lumber Company and the Richards Manufacturing Company will cut about 35,000,000 feet each. The W. H. Miller Company, Limited, will cut 20,000,000 feet. The Dalhousie Lumber Company will cut 30,000,000 feet. The Chaleur Bay Mills will cut in the vicinity of 25,000,000 feet. B. A. Mowatt of Campbellton expects to take out about 20,000,000 feet.

Fraser, Limited, Fredericton, N.B., expect to manufacture about 12,000,000 feet of lumber at their Victoria mills next season. Already their operators are going into the woods to take out the necessary logs. The logging arrangements are in charge of Mr. James M. Scott at Fredericton. Most of the logs will be cut in the vicinity of Fredericton, some of them along the St. John River and its tributaries between Fredericton and Woodstock and some on the Oromocto River. Alex. Fraser will carry on an operation for Fraser, Limited, on the Tay stream and will cut a quantity of timber also for the Partington Company. His cut for Fraser, Limited, will probably be about 4,000,000 feet.

Western Canada

The Joseph Chew Lumber Company, Vancouver, intend to build a mill on Craycroft Island, B.C.

Logging operations will be commenced next spring by the North Pacific Lumber Company at Campbell River, Vancouver Island.

Senator Edwards and associates are planning the erection of a big mill at Dowe Creek, B.C. The material is now being got ready.

The McClinton Lumber Company, Limited, has been incorporated with head office at Pilot Butte, Sask.

The Vancouver Lumber Company has been awarded damages amounting to \$16,875 against the city of Vancouver on account of the construction of the Connaught bridge. The company had claimed \$519,000.

The Prince Albert Lumber Company, Prince Albert, Sask., will employ between 1,200 and 1,500 men in the woods this winter, which is about the same number as last year.

Colonization of its logged-off lands in the Comox district of Vancouver Island is to be carried out by the Canadian Western Lumber Company, the settlers to be brought from the North of Europe.

The Ontario Financial Company, Limited, which has recently been incorporated in British Columbia, with head office at Vancouver, includes among its powers that of carrying on business as timber merchants, sawmill and pulp mill proprietors. The capital stock of the company is placed at \$250,000.

The Weeks Dunell Cedar Company, Limited, has been incorporated in British Columbia, with head office at Fanny Bay and capital stock of \$50,000. The objects of the company are in part to manufacture cedar and other shingles.

Limits on the Stave River, thirty-five miles east of Vancouver, B.C., have been purchased by Watkins & James, Hoquiam, Washington, from the Angevin Lumber Company, of Silverdale. The logs will be marketed at mills on the lower Fraser River.

The great increase in the value of timber on the British Columbia coast is shown in the instance of limits on Vancouver Island, in which a three-quarter interest was purchased by Senator Cox, of Toronto; Hon. W. A. Charlton, M.P., of Ontario, and an associate, for \$150,000. That was six years ago. Since then they have refused offers of \$600,000, \$750,000, and last of \$1,200,000. These limits are to be cruised and mapped on a topographical scale.

Owing to the \$1,500,000 originally provided for the B. C. Mills and the working capital of the British Canadian Lumber Corporation, Limited, being insufficient, the directors recently authorized a bond issue of \$3,500,000, which bonds are to be deposited with a Trust Company as security for an 8 per cent. note issue for the term of three years, amounting to \$3,000,000. The directors asked for a minimum subscription of \$1,000,000 and this has been more than subscribed by the shareholders. This amount is all that is necessary at the present time to make the last payment of \$700,000 on their standing timber (\$200,000 due November 15th and \$500,000 January 1st, 1914), and the balance, \$300,000, together with the semi-liquid assets of the corporation amounting to \$1,400,000, will enable the company to pay off all outstanding current liabilities and give them a working capital of \$700,000.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

1039. Poplar wood for wooden shoes.—A firm in Rotterdam, Holland, desires to communicate with Canadian firms in a position to supply them with poplar wood for wooden shoes. They desire 500 to 1,000 cubic metres of this wood in lengths of about 4-6 metres and a circumference of at least 76 cm.

PINE LUMBER

1 x 4/5	Mill Run	White Pine	1 x 6
1 x 8	"	"	1 x 10
1 x 12	"	"	1x7/9 11/13/up
1 1/2"	Common & Better	"	2"
3"	Dressing & Better	"	
1 x 4/up	Mill Cull	"	1 x 10, 12
1 x 4/5	Mill Run	Red Pine	1 x 6
1" 18'	"	"	2" 17 18

The New Hanchett Swage Shaper

For Bands, Gang Circular and Cylinder Saws

Is a Shaper that you will like and swear by. It has the simplicity, adaptability and efficiency that you have been looking for in a shaper. The instant you look upon it, it impresses you; when you put it upon your saws and feel how easily it slides from one tooth to the next—not a hitch nor a catch except when it is flush in the tooth stop; when you feel the perfect balance and note the perfect alignment of the teeth; the simplicity and perfect adjustments throughout—it appeals to you. When you see the efficient work produced—it convinces you, it captivates you. WHY? Because it is made to suit you; to fit you; to meet your requirements, after we have given nearly a quarter of a century to the study of your needs.

Note the cuts shown herewith. Note the lateral adjustment of the tooth-stop by means of a conveniently located knurled screw; the straight up and down adjustment of both the tooth stop and back rest; by the same means. With this construction, no adjustment is necessary in changing from short space to long space teeth. Note the manner in which the tooth-stop is held—a groove at the side and the adjusting screw at upper corner, thus there is no obstruction of any kind in the line of travel of the saw from back to front except at point where tooth engages tooth-stop. This insures a free riding shaper and a positive stop at the desired point. Note the action of the dies, controlled by a centre control lever giving balance to the shaper and causing the dies to move in unison against the tooth. you will find this shaper 100 per cent. efficiency. Wouldn't you like to know more of this new shaper?

Write for one on 30 Days' Approval, to be returned if it isn't the best shaper you have ever used.

THE
MAIN
DRIVE

has for many years proven its service giving qualities. It is equally reliable for all direct drives whether straight or crossed. It has a good surface for gripping the pulley, runs true and exceptionally straight. It will pay you to investigate this long lived dependable belt. Write for booklet—"The Main Drive."

Federal Engineering Co., Limited, TORONTO, MONTREAL

GOODHUE BELTING

FACTORY TO YOUR MILL

TO the saw mill and woodworking industries we offer an unusually good belting value in our 'Acme Waterproof.' This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts" then you will buy a "Goodhue."

According to the conditions under which a belt has to run we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality but each made for a different service.

Send for particulars and prices

J. L. GOODHUE & CO., LIMITED, Danville, Quebec

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

by using our

Patent Steel Band Mill and Carriage

Results from logs of given dimensions cut on Breeze, Denison & Co. pat. band mill.

Diam.	Log Length	Feet Lum.
8 in.	16 ft.	45
10	12	54
10	16	69
11	15	96
14	16	171

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Newburgh, Ontario

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

The "Merit" Line

The production of wood veneer and its many uses has brought about the "Merit" line of machinery which is the result of a life time devoted to this one branch of woodworking machinery. There are three ways to produce veneer. It is cut in a rotary machine by revolving a round log against a knife which feeds forward at each revolution. It is also cut in a slicing machine by passing a squared block or flitch past a screw fed knife, and it is also sawed in a special form of saw mill. The rotary process is the one in most extensive use and is the one for which the "Merit" line has been designed. Rotary cut veneer is produced in walnut, birch, beech, oak, ash, gum and other hard woods for use in the finest class of furniture, piano cases and interior finish. It is also used for drawer bottoms, glass backs and other purposes calling for common grades. In the form of glued-up panels, it has extensive application. Its use in all kinds of boxes, cases, packages and baskets is universal and the consumption increases annually.

The "Merit" Veneer Lathe.

The characteristic features of this machine are the heavy foundation style of frame, cast in one piece, the extra or "third bearing" for the spindle, the use of dogging wheels that "push" instead of "pull" the spindles into the log, the straight line action of the feed screws, the automatic knife pitch adjustment, the patent tilting and quick releasing pressure bar with its whole length pressure regulation by worm and wheel, the "steady rest and extension spindle" for cutting short logs, the simple and compact feed gear mechanism for determining the thickness of veneer, the devices for quick action and large output and the many adjustments for producing the highest results with the least possible skill of the operator.

This machine is made also in the back roll type for special basket and package work. There are three sizes of swing, 52-in., 42-in. and 32-in. and ten lengths of knife, 28, 34, 41, 48, 54, 60, 66, 77, 88 and 100 inches.

The "Merit" Veneer Clippers.

These are machines with reciprocating knives for chopping or clipping long or random widths of veneer into dimension sizes. The No. 277 machine has a long feed table upon which the veneer is piled and carried forward under the knife. A short table beyond the knife is graduated or may carry a gauge to determine the desired width the sheets must be when clipped. This style of machine is used in connection with the rotary cutter in a veneer mill and operates on the green veneer before it goes to the veneer department.

The No. 258 style has short tables on either side of the knife and is mostly used in furniture factories for dimensioning sheets after they are dried.

The No. 233 and 383 foot power clippers are portable machines for light work of the same character.

The No. 234 and 378 are machines with full automatic feed, used in basket, fruit package and crate factories.

Knife Grinders.

The use of automatic knife grinders is almost universal in woodworking mills and they are indispensable in veneer mills. Our line consists of the Style C machine for veneer knives 48, 54, 60, 66, 77, 88, 100 and 110 inches long, and of the style A for knives of all kinds 26, 32, 44 and 54 inches long. All machines have a water attachment for wet grinding.

Log Hoists.

For hoisting and carrying logs from the steam or hot water vats to the veneer lathe, we offer a quick acting hoist of $\frac{1}{2}$, 1, $1\frac{1}{2}$ or 2 ton capacity and trolleys and beams of corresponding capacities.

Clutch Pulleys.

Having our own design of clutch pulley to meet the severe service required in veneer cutting machines, we offer a limited line of sizes to our customers having special use for clutch pulleys. A price list will be furnished on request.

Veneer Knives.

We solicit your orders for veneer and clipper knives and carry a stock of them in the various sizes required by our machines. These knives are of the best quality and are fully guaranteed.

Crate Head Machinery.

For the production of the strongest, lightest and most practical panel crate head, using a tongue and groove cleat, we offer a complete set of three machines, a tenoner, an automatic coupler or framing machine and a cleat sawing machine. The tenoner and coupler are made in two sizes. The No. 1 for heads up to 12 x 20 inches and the No. 2 for heads up to 24 x

36 inches. For utilizing veneer cores and waste lumber, these machines are money makers.

Basket Bottom and Cover Machinery.

In this department there are three machines; a cylinder saw No. 280 for sawing peach basket and hamper round bottoms from boards; a cover or heading rounder No. 356 for rounding basket covers; and a corner rounding machine No. 355 for cornering Climax basket covers and bottoms.

Hoop Machinery.

This is a set of three machines for manufacturing patent sawed hoops. Plank is first ripped into bars on a self feed rip saw. These bars contain material for two hoops and are passed through the Trautman Complete Patent Hoop Machine which planes, points, re-saws and laps the two hoops at one operation. A hoop coiler completes the set and prepares the hoops for market.

Merritt Manufacturing Company

LOCKPORT, N. Y.

MAKERS OF

"Merit" Veneer Machinery

The "Merit" Veneer Lathe

THE FRAME IS RIGHT:

Because—it is substantial and being open at top and sides nothing is in the way of getting in logs.

THE "THIRD BEARING" IS NECESSARY:

Because—nine-tenths of the spindle strain can be and is taken care of by a bushing or short sleeve which is readily replaced at small expense when worn.

THE PRESSURE BAR IS NOVEL:

Because—it has a pressure wheel which regulates the pressure whole length at one; a lever to give the bar a quick drawback movement; adjusting screws to set up each end of the bar independently; set screws and clamping bolts to hold and adjust the steel pressure plate.

A Little Common Horse Sense

When you estimate your profits, you are badly fooled if you do not take into consideration your overhead expense which includes the energy involved on each detail of every transaction.

Therefore, it is essential that your method of handling your orders is such as to give each department the maximum of efficiency.

The very first performance in a business office after the customer's wants are known is to enter the order and right there is where the greatest amount of care should be given and generally is. It is transcribing and rewriting each order where errors occur (especially in figures) lost time and extra labor expense, all of which bring up the overhead.

The "SHOUPERIOR" method removes all chance of error, falsification, loss of energy and labor, giving the maximum of efficiency at the smallest possible expense.

Thousands of wholesale and retail lumber dealers throughout Canada and the United States are enthusiastic users of "SHOUPERIOR" methods. We maintain a Bureau of Cooperation, Systems and Design with thirty years experience in manufacturing Systems; their experience is free to you. Ask for our booklet "Wasting Money in Business" on your firm's letter head, it will be sent free.

Our Order Department will not accept an order unless they see that you can be benefited. Let us cooperate with you, it may save you an inestimable amount of money.

WHY you should install the Mahony Blower System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses $\frac{1}{2}$ less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

Here's Why People Who Really Know Buy The
FAY-EGAN "LIGHTNING" No. 50 Special Patented Band Scroll Saw

- 1—It does from two to three times as much as any "gooseneck" machine of its size. (36")
- 2—It will do the most intricate or rough and heavy scroll sawing equally well.
- 3—Consumes less power than any other 36" saw.
- 4—Cost of blade up-keep 25 per cent. lower than on any other.
- 5—Guaranteed to be, and actually is, the greatest Band Scroll Saw on the market.

It will pay you to investigate the No. 50.

THE positive uniformity of grit and grade—the certainty of duplicating successful wheels—has made the Aloxite Saw-Gumming Wheel the standard of many a big sawmill.

Once you get the right wheel in the right place, once you let us send you an

ALOXITE SAW-GUMMER

—the wheel that will cut free, fast, and cool without case-hardening the saw—you can rest assured of getting another just like it—a dozen or a hundred more, as like as two peas in the pod—Aloxite—the wheel for steel.

The Shimer "Limited" Cutter Heads, Figures 627 and 628 with Expansion

Why You Should Use The

Shimer Cutter Heads

For Flooring, Ceiling, Siding, Ship Lap, Jointing, Double Ceiling
Doors, Sash, Blinds, etc.

Made of Steel Forgings, they represent the greatest possible strength in compact and workmanlike manner, embodying the vital principles of clearance to all leading Bit Points the alternate and shearing effect of the cut reduces to a minimum the tearing-out tendency of cross-grained lumber. Cutter shave exact shape in their exterior circles, and uniform product is maintained indefinitely without extra trouble or expense.

From the Minute You Put it on the Wheels

you are convinced of the superiority of a DISSTON BAND SAW. A Disston saw possesses to the highest degree all the good points you want in **your** saws.

"There's Quality in Every Foot"

Made of Disston Crucible Steel, manufactured especially for Band Saws, they have that perfect combination of elasticity and toughness, and superior tension and edge holding qualities so essential to a high-grade saw. Ground to an even thickness throughout, they run smoothly and evenly, and will at all times carry the maximum rate of feed for tension given and maintained.

No matter where you are located, there is a mill near you that swears by Disston Saws—ask the man who runs one.

Cling-Surface acts Inside not outside the belt.

The proof of this is easy.

Any one who thinks that Cling-Surface prevents slip by depositing an adhesive on the belt surface can soon learn to the contrary by applying it to the back of the belt. Of course we do not recommend applications exclusively to the belt back but applications so made gradually filter through and into the fibers and impart to the working surface much of the same velvety cling as though the Cling-Surface had been applied to the face.

The above experiment offers fair, square and positive evidence that Cling-Surface leaves the belt face moist but clean, like your damp hand, in the best possible condition to grip the pulleys. Continued treatment until the belt is thoroughly impregnated, and then an occasional application will be equally convincing that consistent systematic Cling-

Surface treatment makes belts pull continually better, even though run slack, makes the belts flexible, preserved and waterproofed and saves immensely in lubricants, fuel, bearings and attention through the reduced initial tension possible.

We know Cling-Surface is unequalled for its purpose. Thousands of customers know it and have made acknowledgment through dozens of repeat orders. One trial and you will know it. Write for literature and tell us your belting troubles. We quote f.o.b. Toronto.

600 Sets Payette's Famous Patent Mill-Dogs Sold

Why?

- Because (1) They will dog with perfect ease and safety in any class of timber.
(2) Will dog just as easily, frozen maple or hardwoods of any description.
(3) Will dog the last board, just as easily as they dogged the first one.
(4) They do not tear the board or stock.
(5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery;—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer; P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders Valves. Five different class and style of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.

Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.

Descriptive Booklet and prices mailed free upon request.

Belting That Makes Good

You're absolutely right, it isn't so much what a belt is, but what it has done for others in your line of work, and how closely the maker stands behind his belt till it does "make good." This is the plan that sells Leviathan Belting.

Main Belting Company

Two Factors With Which You Are Familiar Regulate Timber Values

Supply—it cannot increase during the life of this generation.

Demand—for wood and wood products will not decrease during the life of this generation, if ever.

Caught between these two forces which are moving toward each other steadily, timber values literally are being

Shoved Up

by the pressure behind them.

For these reasons timber is a good investment whether bought for present or future operation or as an investment.

Timber now is being offered at prices which will make your investment profitable, not in many years but a few years.

You are entitled to information about timber bargains. Ask for it.

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited
ORILLIA, ONT.

THESE HEADBLOCKS WILL WEAR

They are of new design, gotten up specially to withstand the jarring of heavy niggers, and they will stand the strain of the hardest work.

About twenty of them have been tested in mills all over the country since the beginning of the present sawing season, being thoroughly tried out.

The service they have given marks them as great headblocks well worth your while to investigate. May we send particulars?

William Hamilton Company
Peterborough, Ontario

Berlin Standardizes Matcher Construction

Final improvements have been made on Berlin Matchers. Every part is now standardized.

The limits of practical production and raising of the quality of manufactured lumber have been reached.

It is improbable that better manufacture or faster production than Berlin Matchers are now capable of, will ever be accomplished.

A Machine Without Flaws

The work of years and years, on the part of the best engineering ability in the world on wood working machinery, has culminated in a machine that is without flaws, a machine capable of producing the finest quality of lumber at rates of feed upwards of 200 feet per minute.

In the final improving of Berlin Matcher design and construction every part that is subject to wear has been strengthened, made of the best materials, and redesigned for the utmost of service. The aim is to reduce an already low upkeep cost, add years to the life of the machine, insure fast feeding ability throughout the life of the machine.

Greater Matcher Value

This standardizing of Berlin Matcher construc-

tion insures to every buyer greater Matcher value, absolute knowledge that the Berlin Matcher he buys gives him all that human ingenuity is capable of today, in such a machine.

Every operating convenience is on this Berlin Machine. More adjustments are made automatically than on any Matcher previously built. It carries the benefit of the total experience of hundreds of Matcher-Profilers users.

One Design Means Cheaper Production

We will now put out hundreds of machines, after one approved standard design. Standardized Manufacturing on that scale means cheaper production of every part. Economy to us means economy to you as well.

We have large numbers of the latest machines on schedule, but we can build no more than we now have on schedule.

For that reason we urge early investigation. Deliveries will be in the order that contracts are made.

Begin your investigation by asking us for full descriptive data today. Act quick!

Ask for our proposition today

BUILT FROM EXPERIENCE

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service and often in localities where repairs cannot be made without great inconvenience.

When you want a locomotive you cannot afford to overlook the experience of this company.

Experience in building large locomotives is invaluable in connection with the design of smaller ones in order to insure reliability which is the main question in logging work. You know what delays cost you.

Whitney Engineering Co., Tacoma, Wash., North Western Sales Agent

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

MORTISER**MORTISER****505 POWER MORTISER**

A heavy substantial power mortising machine.

This mortiser through its simple yet efficient design is capable of producing a large amount of heavy work without that jarring strain to the operator so common in chisel mortisers. More details will be found in our Bulletin No. 505 which we will be glad to send to you.

We can make immediate shipment from stock.

Waterous No. 0 Portable
Sawframe—carries 60" saw
"Best by Test"

CIRCULAR SAWFRAMES

For Portable, Medium and Heavy Mills

WATEROUS Circular Sawframes are built to suit every mill size. Their capacity ranges from 2000 to 25000 ft. per day. Every frame we build is supplied with a heavy mandrel

of larger diameter than is the general custom. Three bearings are used to support it. Fittings include wide-faced powerful iron and paper friction feed-works, disc wheel splitter, timber guage, belt tightener, and rigid and quickly adjustable saw guide.

In the design and construction of these Frames we have worked from the operator's view point and have combined in them convenience, accessibility and simplicity of handling, with exceptional strength and accuracy.

For many years the No. 0 Sawframe, which is shown in the cut above, has been sold as part of our Portable Outfit, and its indorsement has been universal. The heavier frames of cast iron and steel construction throughout have also been given the test of years of actual service, and with improvements suggested by this use have made good wherever installed.

Waterous No. 1 Sawframe—takes 60" saw—weight, 2300 lbs.

A new catalogue, No. 110, of Sawframes and Accessories only, has just come in from the printer—we have a copy here for you.

The Waterous Engine Works Co., Ltd.

BRANTFORD, CANADA

Agency—H. B. Gilmour, Vancouver, B.C.

Branch—Winnipeg, Man.

\$5,000,000.00

worth of mixed metals is what we market every year

PEERLESS metal is compounded specially for sawmills and is the best on the market for that purpose.

FAULTLESS metal is a high grade copper hardened alloy made for heavy duty work, sawmills and engines. Our policy is large tonnage, perfect alloys, and absolutely fair and honest treatment of the trade.

NO FRAYING AT THE EDGES

Dick's Balata Belting possesses perfect uniformity throughout, whereby true and steady running is ensured, fraying at the edges rendered impossible, and perfect success in fork driving guaranteed. The combination of strength and uniformity in Dick's Belts is due to the process of solutionizing to which the textile portion of the Belting is subjected, and which thoroughly solidifies and unites the whole material. You can get all the facts in our Catalog No. 17.

WE have at our Lakefield mill almost all sizes and all grades of white pine cut from sound logs running about 45 ft. to the piece.

You know we get from this class of timber, sound, small red knotted lumber.

Our mill run grade contains all the log produces except the culls and clear. The per cent of Box & 3 Barn is very small.

All dry. All sizes. All grades.

Can you spare time enough to come over and see this Lakefield stock. Only a short run from Toronto.

However, let us quote prices and describe our grades.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |
| | POWER PLANT |
| | 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| | 2 Double Duplex, high pressure Water Pumps. |
| | 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| | 2 125 h.p. Water Wheels. |
| | 1 Upright Engine for sawdust conveyor. |
| | 1 10 h.p. Engine. |
| | 1 Mitts & Merrell Hog. |
| | 1 Wood Machine for 22-in. wood. |
| | 1 Wood Machine for 16-in. wood. |
| | 1 Edger for ripping dry lumber, installed. |
| | 1 Edger for ripping dry lumber, not installed. |
| | 1 30 h.p. Generator, 250 volt. |
| | 1 30 light arc generator. |

FILING ROOM

- 1 Automatic Filing Machine for 12-in. D.C. band saws.
1 Automatic Grinding Machine for 8-in. S.C. band saws.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

Lumber Camp Ranges and Heaters

Our stoves are specially designed to meet all requirements of camp work.

We know exactly what is necessary and desirable in this class of stove.

We put into all our stoves the best of material and workmanship coupled with the best of expert experience.

The 'Leader Range' for coal and wood, shown in this cut is specially adapted to Lumberman Camps, Boarding Houses, Hotels and Railroad Construction Camp Work. We also make this Range with side hinge doors.

It is large, heavy and strongly built. Has good oven space and large heating surface. When a good, solid, reliable stove is wanted the 'Leader' will give satisfaction.

GOOD YEAR

HOSE

For Greater Protection---For Longer Wear

¶ The Goodyear Hose-making equipment is the most up-to-date in Canada. We have the latest improvements known to the trade. Every process is under the control of experts, who know the Goodyear requirements and see that a uniformly high standard of quality is kept up.

¶ We take no chances with the raw materials. A stringent laboratory examination determines the quality of the raw rubber. The hard long-fibre cotton which is specially woven for Goodyear Hose-making is submitted to tests for strength and weave.

¶ The walls of the hose are composed of long strips of cotton fabric thoroughly impregnated with rubber or friction. And cut on the bias to resist expansion, bursting and elongation. This friction-impregnated fabric is rolled under great pressure, which ensures a perfect union of the plies.

SUCTION HOSE

¶ We build into Goodyear Hose the same strength and indestructibility as have made Goodyear Rubber Belts famous. Goodyear Suction Hose is steel-wound internally to guard against collapse. The coil is of round or flat wire, and round it the hose is built up, ply upon ply of rubber-permeated cotton fabric. This fabric is made from special hard-staple long-fibre cotton, and is cut on the bias to give strength and hard wear.

¶ Goodyear Suction Hose is made for every purpose—and can be had rough or smooth bore. Is in service throughout Canada—on wrecking and dredging contracts—in factories and mines—on farms and in saw-mills. Special hose made for sand-sucking, oil, gasoline, vinegar and acid, wine, etc.

STEAM HOSE

¶ Steam Hose gets more hard usage than any other hose. In the Boiler Room it lies around near the furnace and is scorched—a hot firing tool is carelessly thrown down upon it—oil is spilt over it.

¶ Goodyear Steam and Hot Water Hose is made with special heat resisting lining, which keeps the extreme heat from the friction fabric. This gives the extra durability—it will stand up well under hard usage. In its manufacture the materials undergo special treatment to resist oil—so destructive to common hose. The rubber and duck used in Goodyear Steam Hose are specially tested for service under high pressure of steam and hot water. We supply it steel wire wound or marline jacketed.

GOODYEAR MILL HOSE

¶ When Mill Hose is wanted it is wanted badly. To find that your Mill Hose has cracked and rotted while lying idle is serious. "Goodyear Underwriters" is always ready for effective service. We build this hose to meet the requirements of the Associated Factory Mutual Fire Insurance Companies. It bears the required stamp of approval "tested to 200 lbs. pressure." The inner tube is made from NEW Rubber of the highest grade, uniform in thickness and quality. The cotton fabric is of special circular web woven to the Underwriters' specifications for a minimum of expansion or elongation under pressure. It is antiseptically protected against rot and mildew.

¶ For Factories and Mills the "Goodyear Underwriters" is a hose which will lower insurance rates, and cannot be excelled in durability and strength. You see it everywhere—the hose with the black and yellow stripes.

115

GOOD YEAR
**RUBBER
HOSE**

AIR HOSE

¶ With fair usage Goodyear Air Hose will be found proof against internal decay from oil—breaking away of pieces of the tube—and clogging of the machinery. The lining is made from selected rubber and cured to prevent hardening from the heat and pressure.

¶ Goodyear Air Hose will give good service under intermittent pressure.

¶ In mines, engine and boiler works, steel construction contracts—wherever pneumatic tools are being operated you will find Goodyear Air Hose. Wire or marline winding or marline jacket.

Bathurst, New Brunswick, Canada

How Often You Have Heard It Said "DEFIANCE Woodworking Machines Are the Best in the Long-run"

They are doing satisfactory work in the various woodworking plants all over the world. Especially do we wish to call your attention to our

AUTOMATIC SPOKE TURNING LATHE

As shown herewith. It will turn either Common, Sarven-Patent, or Sharp-Edged Spokes, as well as Automobile and Auto-Truck Wheel Spokes. It is fitted with squaring head which automatically advances and retreats from the spoke. The machine is built in six sizes to turn spokes, 24", 32", 38", 42", 48", 52" and 58" and the work performed is always of the very highest character.

Further particulars and price will be cheerfully furnished upon application.

Trucks 7-inch wheels, and 1 1/4-inch axles
Length Track 32, 40, 48 or 56 feet
Style and Opening of Blocks Cl-36 inches
Style Mill Dogs Pony Excelsior
Style Set Works No. 1 Single Ratchet

With each complete size "S" mill we furnish onesaw wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

Knight Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

THE KNIGHT MFG. CO., Canton, Ohio.

 Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

No. 21

Trade Prospects for 1914

We are again approaching that season of the year when it is the general custom to take stock of the last twelve months' business and make plans for the next season. For this reason, as well as for the fact that the past year has been attended with very unusual conditions, a few remarks on the trade outlook for the coming year will be opportune.

Whether or not the year 1914 will be an active period for us industrially depends, in the main, on two factors—(1) the natural demand for manufactured products, and (2) our financial ability to purchase these products. Without question there is only one answer to the first. Canada's capacity for almost unlimited development is established beyond the shadow of a doubt, so that our manufacturers may be assured of an ever-increasing demand for practically every class of manufactured article. It remains then to discuss only the ability of Canadians as individuals, municipalities or private companies, to provide the purchase price.

During the past summer, tight money has been a very real obstacle in the way of certain lines of activity. This condition was brought about partly by the unusual requirements of the European continent; also to a considerable extent by the amount of money that had become tied up in realty investments from one end of the Dominion to the other; but these conditions were intensified by the conservative, ultra-conservative, we believe, attitude of our banks. Arguing that the signs foreshadowed a repetition of the crisis of 1907 and similar previous periods, and believing that prompt action would save the situation, they have followed the policy, apparently quite consistently, of lending no money which, as they thought, could by any possible chance be used to encourage the general extravagance to which Canadians were rapidly becoming habituated—the result largely of a number of years of unusual prosperity and plentiful money which had turned the heads of a large percentage of our citizens. This action of the banks has caused a great deal of discomfort to even their most deserving customers, and while it is generally conceded that caution, in reason, was the wisest course that could have been followed, it appears to us that the banks, by taking the extreme

course, have unnecessarily curtailed the circulation of money and have done much towards producing the very condition—a trade reaction—they sought to prevent. Just how far their course was justified is difficult to determine, and it has undoubtedly placed the banks in a sound position so that at no time have they had to refuse assistance for developments which, in their own judgment, they have considered necessary. As a result the larger industrial life of the country has not suffered seriously, nor is there any sign of it in the future, for want of sufficient capital. Certain industries report the biggest year's business in their history.

As already indicated, the extent of the demands to be made on our factories during the next twelve months will depend on the amount of money in the hands of (1) the individuals, (2) municipalities, and (3) private corporations. Our recent bountiful harvest has been an all-important circumstance which will mean that the general public is pretty well supplied with money. The farmer only knows through the newspapers that money is scarce. As a result, the small retailer of general supplies such as hardware, boots and shoes, etc., except in the larger centres, will probably not experience any diminution in trade; this means continued prosperity for the wholesale dealer and manufacturer. In the building industry is it not a fact that practically every city and town in Canada is under-supplied with both public and residence buildings; and the population still continues to increase at a rapid rate? While building permits issued during the last month or two indicate a slackening in this line of trade, this is, we think, explained, in large measure, by the very general feeling that both workmen and supplies will be obtainable at lower rates; also, due to tight money, a certain amount of sacrifices have been thrown on the market. We see no sign of a diminished demand, however, and this slight reaction will just mean an increased activity in building trades of all kinds as soon as the money situation has readjusted itself. With an already inadequate supply of buildings, an ever-increasing population, and a fair distribution of money among the middle classes, the demand for all kinds of building materials seems assured.

With the larger municipalities and private corporations the outlook may not be so entirely optimistic. These have found it necessary, often, to go outside of Canada for their supply of money, which has not been so readily forthcoming during the last few months, on account of similar demands from other sources. Canada's natural resources, however, constitute a splendid security which stands behind all her industrial undertakings and we are confident that, even in a world competition, she can obtain the necessary supply of capital; perhaps, just at this time, at a little higher rate, but not so high that the resultant developments will not amply justify the increased cost.

And after all has been said on both sides, Canada's immediate and ultimate prosperity is inseparably tied up with the prosperity of her great rural population, which at the present moment is possibly not equalled in any other country in the world. Our crops, just harvested, will put into the pockets of the farmers during the next few months in the neighborhood of \$300,000,000. This will soon find its way through the usual channels to the manufacturers. To this sum might be added dividends from investments which are being distributed to the general public at the annual rate of something over \$150,000,000. This will also indirectly reach the manufacturer. The extent to which the natural frugality of the average citizen will assist in the readjustment of conditions is, of course, difficult to determine in dollars and cents, but there is no doubt that, at a time like the present, a general policy of curtailment is being followed by most of us and these accumulations will be ready for circulation as soon as the general public judges the opportune moment has arrived.

Summing up the situation, while we anticipate that difficulties will continue to be encountered for some time in obtaining large sums of money abroad, this condition, we believe, will be more than offset by favorable local factors of which we may mention—(1) the unsatisfied demand for every kind of manufactured product; (2) unexampled prosperity of our great rural population; (3) good security and high returns of Canadian investments which means ability to borrow abroad; (4) present low conditions of stock supply; it is generally conceded that the retailer is running very low following the general policy of caution.

An Interesting Opinion on Yellow Pine

So much has been said during the past few years about the great amount of yellow pine imported into Canada from the Southern States and the serious effect it has had upon the demand for Canadian lumber, that the views of an important manufacturer of yellow pine which are published elsewhere in this issue will be of much interest to readers of the Canada Lumberman. Mr. R. A. Long, who visited Canada recently and whose views are expressed in an interview is one of the most successful lumber manufacturers in the Southern States and a man whose views upon trade questions are always sought wherever he may be. At trade conventions, Mr. Long is invariably one of the most highly appreciated speakers and in those trade associations of which he is a member, he is always pressed to occupy executive positions of honor and importance. His views, therefore, upon the yellow pine situation are of much interest to all in Canada who are interested in the subject.

Although the opinions expressed by Mr. Long are concise, they sum up in a very forcible manner the chief points of the situation. In the first place two features are particularly interesting, inasmuch as they seem to indicate that the manufacturers of yellow pine are not operating upon business principles. Although the output of yellow pine, according to Mr. Long's statement, is in excess of the demand and although prices are demoralized, at the same time the maximum production has been reached and will rapidly decline after the next four or five years. In fifteen years, Mr. Long predicts, the output will not be more than one-fifth of its present-day total.

From an economic point of view, this is a most peculiar situation. In the course of fifteen years, yellow pine stumpage will apparently be of much greater value than it is today and yet the owners are now producing lumber so much in excess of the demand that markets both at home and abroad are demoralized. One would expect them to close up their mills for considerable periods and allow the stumpage value to increase, rather than sacrifice stocks at present prices. The situation inclines one to believe the opinion so frequently expressed, that the present policy of over-production is the result of the necessity to make continual and extensive payments upon heavy indebtedness.

In the history of sawmilling in other countries, one usually finds that production drops when the demand falls off. Moreover, when the visible supply of raw material commences to show signs of exhaustion the general result is either that operations shrink or prices advance. In the case of yellow pine, up-to-date operations have been increasing and prices declining in the face of the approaching ex-

haustion of standing timber. Before the production of yellow pine reached its maximum a few years ago, Canadian manufacturers of lumber who had to face its competition, felt that this competition would decrease so soon as the production reached its high-water mark. Present indications point clearly to the fact that little permanent relief may be expected until the production becomes so much smaller as to bring the supply within reasonable limits of the demand. The matter therefore is one, so far as the producers of yellow pine are concerned, which depends entirely upon the demand in the United States and the supply of timber. So long as the demand continues dull and until the supply of timber has been much more extensively cut out, we may count upon the manufacturers of yellow pine looking for an outlet in Canada for their surplus stocks.

Canadians have always felt certain that the yellow pine stocks sold in this country are disposed of at prices much lower than those which are accepted in the markets of the United States. Certainly the price accepted in Canada involves a loss to the manufacturers in practically every case. As to the price in the United States, Mr. Long expresses an interesting opinion: "I do not believe you are correct," he says, "in assuming that our manufacturers are shipping lumber into your country at lower prices than they are selling for at home, for I know that prices in our home markets are badly demoralized." Without wishing to question Mr. Long's views on this point, Canadians will hardly be able to agree that they represent the case accurately. The process has been going on for so long a time that it is impossible to understand, if Mr. Long's views are entirely correct. If manufacturers have been selling both in the United States and Canada at a loss, during a long series of years, the deduction is that a large number of companies have been able to meet their business engagements although doing a losing business, "which," in the words of Euclid, "is absurd." One may rob Peter to pay Paul and continue the process for a certain length of time, but it cannot be done indefinitely. Canadians have unquestionably been compelled to face a competition based very largely upon a sacrifice of stocks made for the sake of protecting home markets.

Canadian manufacturers will be glad to learn that there is reasonable hope for relief within the next four or five years, on account of the declining production. This view is probably based upon Mr. Long's personal observations. It is also corroborated by official statistics which have recently been published, showing that the supply of standing yellow pine timber in the United States, if cut at the present rate, will be practically exhausted in about thirty years.

A Sermon on Business Methods

Something in the form of a sermon upon present day business methods in connection with the lumbering industry in British Columbia, is given by a prominent lumberman in an article published elsewhere in this issue. The writer of this article is a man who has been closely in touch with manufacturing and selling conditions in Western Canada for many years and who has at last concluded to give expression to the ideas which have been disturbing his peace of mind for a long time past. Briefly, his complaint is that many of the lumber manufacturers and salesmen of British Columbia fail to exercise that ordinary amount of caution in connection with their manufacturing and selling operations; that characterize business methods in practically every other line of industry. Over-production and price cutting are the two evils against which he directs his criticisms and he bases both of them upon an unreasonable "love of money." Now, it is a most difficult matter, in connection with such a question, to determine just where the necessity for making a living goes out of effect and the love of money comes in. In the first place, the necessity for making a living is the all-important factor, but sooner or later, in the great majority of cases, it not only becomes secondary to the love of money, but is carefully maintained to be the chief cause actuating the man who is really actuated by his desire for wealth.

During prosperous times the necessity for making a living is

frequently forgotten, but so soon as depression strikes the industry it crops up and brings fear into the hearts of the man or the company who have gone too greedily after profits by the over-production route. Lack of caution in connection with production is apparently the seat of the trouble and the love of money is its germ. These, in short, are the ideas set forth in the article referred to and they are worthy of much more than a casual reading.

We do not wish to present these views as our own. We want our readers to consider them as the views of a man who has been engaged in the lumber manufacturing business in British Columbia for many years. If this is borne in mind by readers, the ideas will probably have greater weight and do more good than they otherwise would. We would draw particular attention to the very forcible instance given in the article of how the unreasonable desire to take sales away from the other man, leads to trouble and loss. A reasonable and successful lumberman will base his selling business largely upon the principle of getting his cost and a reasonable profit out of the stocks which he puts on the market. When he finds his competitor quoting a lower price involving little or no profit or possibly a loss, he will be content to let the other man have the business. This is the foundation of all successful business methods today, yet in the lumbering industry one hears all the time that it is a principle which is often more honored in the breach than in the observance.

How to bring about a really effective remedy is more than it is possible to say at the present time. It is true, however, as the writer of the article says, that the lumbermen of British Columbia today are so chastened and subdued by unsatisfactory business conditions that the present is a good time for preaching. Probably the points of the article will go deeper home on this account. There is one feature of the article regarding which we would like to make some comment, namely, that it deals solely with the situation in British Columbia. The ideas discussed, however, are applicable in varying degrees all over the country. In Eastern Canada today there are conspicuous examples of the effect of the same kind of business methods. Fortunately there are also equally conspicuous examples of the success resulting from the opposite course.

We hope to be able to present the views of the same writer upon other features of the business situation in future issues of the Canada Lumberman. In the meantime we would ask those who read the article by "Douglas Fir" to give it their best study, accepting it as a bona-fide effort on the part of the writer to open the eyes of those who are in error and to do his share in bringing about a more general appreciation of the importance of conducting the lumber business upon sound business principles. If these letters result in other lumbermen of British Columbia, or any other part of Canada, being sufficiently interested to discuss the question in articles written for the Canada Lumberman, we will be greatly pleased to use our columns for the purpose of carrying on a study of the situation from its many different angles.

The Numerous Uses of Beech Lumber

An interesting bulletin recently issued by the United States Forest Service deals with the various uses of beech, drawing particular attention to its use for the production of wooden shoes. The manufacture of wooden shoes has reached considerable proportions in the United States. These shoes cost from 60 to 75 cents a pair and are good for two years. They are worn by those who have to work in cold or wet places, such as tanneries, breweries, and livery stables, and by workmen in steel mills and glass factories who must walk on hot grates or floors. Farmers, too, are classed among the users.

Beech wood is put to a much wider range of uses than the average person would be likely to suspect. It enters into hundreds of articles, from hobby-horse rockers to butchers' blocks. We walk on beech floors, eat off beech picnic plates, carry beech baskets, play with beech toys, sit on beech chairs, and in dozens of other ways use articles made of beech almost every day of our lives. Its freedom from taste fits the wood especially for articles which come in contact with foodstuffs, and beech meat boards, skewers, lard tubs, butter boxes, sugar hogsheads, refrigerators, dishes, spoons, and scoops are widely used.

Only one species of beech grows naturally in Canada and the

United States, but few trees have a wider commercial range. It extends from the Gulf of Mexico into eastern Canada, and in practically every place where it grows it is cut for market. The total yearly output of beech wood in the United States is approximately 500,000,000 board feet.

In Canada during 1911 the production of beech amounted to 11,885,000 feet, whereas in the previous year the total was 18,565,000 feet. The total value of the 1911 stocks of beech cut in Canada was \$171,963. The average value per M. feet in 1911 was \$14.47 and in 1910 \$12.47. Ontario produced 72.6 per cent. of the cut of beech in 1911.

Beech is one of Ontario's cheapest hardwoods, probably the cheapest used as lumber. It is hard, strong, tough, moderately stiff and often cross-grained. It is very perishable and liable to shrink, warp and check even after seasoning. The supply, while not unlimited, is still sufficient to supply certain industries for some years to come if properly utilized. Over 4,000,000 feet of beech is used annually in Ontario for hardwood flooring. Beech makes an excellent flooring and takes a high polish. Of the beech consumed in Ontario, during 1911 about 500,000 feet was brought from the United States and a few thousand from eastern Canada.

Latest Crop Bulletin Shows Good Results

A bulletin issued on October 13th, by the Census and Statistics Office of the Department of Trade and Commerce gives a provisional estimate of the yield of the principal grain crops and also the average quality of these crops at harvest time.

For spring wheat the estimate for the end of September is 188,468,000 bushels as compared with 182,840,000 bushels last year. For fall wheat the estimate is 19,107,000 bushels as against 16,396,000 bushels last year, and 18,481,000 in the preliminary estimate this year. The total estimated wheat production this year is therefore 207,575,000 bushels, as compared with 199,236,000 bushels last year, an increase of 8,339,000 bushels or 4¼ per cent. The yield per acre for all wheat is 21.15 bushels, as compared with 20.42 bushels last year. Oats show a total yield of 391,418,000 bushels and an average yield of 40.57 bushels, as compared with 361,733,000 bushels and an average yield of 39.25 bushels. Barley gives an estimated total yield of 44,348,000 bushels and an average of 31.10 bushels in 1912. For this year the total production of rye is 2,559,000 bushels, of peas 3,974,000 bushels, of buckwheat 7,600,000 bushels, of flax 14,912,000 bushels, of mixed

grain 17,178,000 bushels, of corn for husking 14,086,000 bushels, of beans, 989,500 bushels, as compared with a total yield last year for rye of 2,594,000 bushels, for peas of 3,773,500 bushels, for buckwheat of 10,193,000 bushels, for flax of 21,681,500 bushels, for mixed grains of 17,952,000 bushels, for corn for husking of 16,569,800 bushels, for beans of 1,040,800 bushels.

For the three Northwest provinces the total yield of spring wheat is estimated at 183,852,000 bushels, of fall wheat at 5,264,000 bushels, of oats at 239,595,000 bushels, of barley at 27,904,000 bushels, of rye at 686,000 bushels, of flax at 14,808,000 bushels.

The average quality of these crops measured upon a per cent. basis of 100 as representing grain well headed, well filled, well saved and unaffected to any appreciable extent by frost, rust, smut, etc., is as follows: spring wheat 89.17, oats 90.52, barley 88.25, rye 85.41, peas 81.71, beans 78.48, buckwheat 73.40, mixed grains 90.59, flax 82.68, corn for husking 75.16. Of these wheat, oats, barley and rye are above the average quality for either of the last two years.

The report of the 15th annual convention of the Canadian Forestry Association which was held at Winnipeg on July 7th, 8th and 9th, has been issued by the Association in book form. All the interesting addresses which were delivered at the convention are contained in the book, together with a verbatim report of the discussion. The book also contains an alphabetical list of those who attended the convention and an excellent index from which to locate the various subjects of interest which were under discussion. The report will be a valuable addition to the library of all who are interested in forestry.

One of the most remarkable of the many valuable hard woods of Australia is yate. According to the Engineer, this tree apparently furnishes the strongest timber known. Its average tensile strength is twenty-four thousand pounds to the square inch, equal to that of cast iron. Many specimens are even stronger, and one was tested up to seventeen and one-half tons to the square inch, a tensile strength equal to that of wrought iron. The tree sometimes grows to a height of one hundred feet, and is often more than two and one-half feet in diameter.

Important B. C. Lumber Manufacturers

Electrically Equipped Mill Operated by British Canadian Lumber Corporation at New Westminster—Description of Plant and Other Properties

Burner at New Westminster Mill

The accompanying illustrations are from photographs of the plant, at New Westminster, B.C., operated by The British Canadian Lumber Corporation, Limited, which owns extensive properties in British Columbia, and is one of the largest companies engaged in the Canadian lumber business. The concern was organized in 1911 with a capital of twenty million dollars, the stock being placed with strong financial interest in Great Britain, Canada, and the United States.

The company own three mills, in addition to more than nine billion feet of standing timber, over nine-tenths of this being situated on tide water on the coast of British Columbia, and available for not only water transportation to any part of the world but near the terminus of the great trans-

continental railways. Independent of the important home market in the province of Alberta, Saskatchewan and Manitoba, there will be, when the Panama Canal is finished, the great eastern consuming centres such as New York, Philadelphia, Baltimore, and the great cities of Great Britain and Europe as a market where this product can be laid down for about one-third the freight now charged between Vancouver, New York and Montreal. One-tenth of the corporation's holdings is situated in the interior of British Columbia near Nelson, where one of the mills owned by the corporation is situated. This interior holdings was purchased to supply the southern prairie market.

The following are the tracts of timber owned by the corporation and the quantities: Howe Sound and Port Moody, 375,000,000 feet; Port San Juan, 1,400,000,000 feet; interior properties, 900,000,000 feet; Rivers Inlet, 1,600,000,000 feet; Princess Royal, 426,560,000 feet, and Masset Inlet, 4,306,000,000 feet.

One of the corporation mills is situated at Crescent Valley in the interior near Nelson, and has a capacity of 140,000 feet per day. It is a steam mill, built on the most modern lines, of concrete and sheet iron. The corporation houses all its own workmen; supplies them with all necessary material from its stores, and provides school accommodation for the children of the workmen.

Another mill, in Vancouver city, is operated by steam, and has a capacity of 160,000 feet per day. This property is situated almost in the centre of the city of Vancouver and is a very valuable property. In fact, the corporation has been offered over 100 per cent. profit on its purchase price of this property. A large local trade with the city of Vancouver is carried on as well as a large rail trade to the prairies.

An Electrically Operated Mill

The most important mill belonging to the corporation is at New Westminster. This is electrically operated, and is one of the finest

Dry Kilns at New Westminster Mill

on the North American continent. It is built on 40 acres abutting on the Fraser River, and inside the city limits, and was constructed from plans by Mr. A. B. Pracna, of Vancouver. To secure the desired solidity it was first necessary to drive a great many piles, the entire number needed for the various buildings, platforms and log-holding booms being about 5,000.

The power plant is housed in a reinforced concrete building located about fifty feet west of the main building, the dimensions being 128 x 48 feet, and the height 28 feet. The roof is of the steel truss type, covered with galvanized iron, the floors are of cement, the window frames of metal and the glass of special design to resist heat, hence the structure may be said to be absolutely fireproof. On the ground floor a space of 100 feet in length is taken up by the battery of eight horizontal tubular boilers, each 72 in. x 18 ft. in size, and designed to withstand a working pressure of 165 lbs. of steam per square inch. They were manufactured by the Vancouver Engineering Works, and are set in "Dutch Oven" style, so as to receive their fuel automatically by means of conveyors when the mill is in operation; at other times they are fed automatically from a reinforced concrete fuel house close by, 24 x 100 ft. in size, which receive and store all the shavings blown from the planing mill and timber sizing machines on the sorting works platform.

The turbine room is 28 x 48 ft. in size, the cement floor being level with the steel floor in front of the boilers. On a massive foundation reaching to bedrock stands the huge Allis-Chalmers, 1,500 kilowatt 80 per cent. P. F. turbine generator, built to operate at 1,800 r.p.m. This turbine is capable of developing 3,000 h.p. when needed, the nominal capacity being 2,500 h.p. It supplies current to the seventy odd motors operating the various machines in the sawmill and planing mill, and also for lighting purposes. The current is three-phase, 480 volts, and is transmitted to the mills from the main switchboard in the power house by means of cables run in conduit. After entering the sawmill the current is distributed through a system of panels to the individual motors driving the machines, each motor being controlled by a "starter," which is located alongside the operator. (In an electric mill of modern design an important feature

British Canadian Lumber Corporation's Mill at New Westminster

Piling Shed at New Westminster Mill

Turbo-Generator at New Westminster Mill of British Canadian Lumber Corporation

Dynamos at New Westminster Mill of British Canadian Lumber Corporation

is the ability of the man in charge to start and stop his machine without in any way interfering with the working of other portions of the plant). All cables and wires for both power and lighting purposes are carried throughout the mill in piping, thus making it absolutely impossible for fires to originate from short circuits and accidental contacts.

Capacity of the Motors

The capacity of the motors installed is as follows: 250 h.p. motor driving 10-ft. band mill; 200 h.p. motor driving 9-ft. double cutting band mill; 200 h.p. motor driving 48 x 16-in. gang; 150 h.p. motor driving large edger, 72 x 10-in.; 125 h.p. motor driving small edger, 66 x 10-in.; 100 h.p. motor driving 7-ft. Merzhon resaw; 60 h.p. motor driving lath mill; 60 h.p. motor driving Stetson-Ross timber sizer; 50 h.p. motor driving Stetson-Ross ready sizer; 40 h.p. motor driving Stetson-Ross shiplap machine; seven 5-h.p. motors and one 7½-h.p. motor driving sorting works chains in separate sections (each section so controlled by friction that it can be stopped at will); forty-nine motors ranging from 40 h.p. down to 5 h.p., operating balance of mill.

The main building is 72 x 378 ft. in size, and parallels the Fraser, the head of the mill pointing northeast, or up stream. Specially heavy timbers were used in its construction, the posts throughout being 14 x 14 in. The mill is two storeys in height with the exception of the filing room, 72 x 60 feet, which is located in a third storey. The mill roof has a cupola 24 feet wide running the full length except the space occupied by the filing room, the sides being glass in order to light the mill floor. A wing on the southeast side, 32 x 49 ft., two storeys, contains the lath mill machinery, and another on the northwest side, 28 x 196 feet, the trimmer room, sorting works and shingle cut-off room. A spacious platform at the rear of the mill accommodates on its west side the transfers for sorting timbers; already 230 ft. in length, this platform is to be extended still further. On it is located a 20 x 30 in. four-sided Stetson-Ross timber planer, with feeding-in and feeding-out rolls to handle timbers up to 100 ft. in length. The live rolls on the northwest side of the mill extend in one continuous "string" from the log deck in front of the double-cut

band to the end of the 230-ft. platform in the rear. The loading deck is so arranged that timbers can be dropped from the live rolls at any desired point. Car tracks parallel the northwest side of the platform; at present there is space for the placing of six 40-ft. cars, and this is to be increased to twenty boxes or flats.

The log haul is at the northeast end of the mill, and is built to handle British Columbia monsters up to 100 feet in length. The log deck is equipped with kickers for throwing logs off the chain, also Kline log loaders to transfer logs to the carriages. The northwest side of the mill deck has Hill niggers and live rolls to serve the double-cut band mill; the southeast side is equipped with Simonson log-turner for handling big logs sent to the 10-ft. single cutting band mill. The south side carriage has four blocks with 72-in. opening, and two block trailer, and is propelled by a twin engine 16 x 18 in., with drum for 120 feet of travel; the north side carriage has four blocks, 66-in. opening, and is driven by a twin engine 14 x 18 in., having drum for 60-ft. of travel.

Immediately back of the 10-ft. band are cant "flippers" and transfers to convey cants to the double-cutting band on the north side of mill, also a steam bridge for crossing live rolls. A second Hill nigger is installed back of the double-cutting band for loading cants; there are also steam flippers and transfers to throw cants from either band mill to the gang, which stands in the centre of the mill floor. Back to the gang are transfers and steam lifts for delivering lumber from gang to either or both edgers, also transfers with steam lift to take timber from live rolls on either side to the edgers. In the rear of these machines are other live rolls which deliver to transfer chains; these carry the lumber automatically to the trimmer saws. There are also transfer chains and steam lifts, the duty of which is to shift the slabs onto the slasher chains. The slasher carries nine 42-in. saws, the arbor being direct connected to the 50 h.p. motor. There are two 20-saw automatic trimmers, the saw frames being hung overhead and operated with compressed air. The lumber passes automatically from the trimmers onto the sorting chains—these are so arranged that by means of a steam lift any portion of the lumber thereon may be diverted into the resaw room—50 ft.

Boilers at the New Westminster Mill

Filing Room at the New Westminster Mill

General Interior view of New Westminster Mill

square—where the stock passes automatically to the 7-ft. Merston resaw. After being resawn the lumber is automatically carried to the sorting works at almost the same point where it was delivered by the trimmers. By this arrangement the lumber is made to pass the grader both before and after it is resawn.

The sorting works are carried out from the mill at an elevation of about 4-ft. above the sawing floor, and maintains this height until past the dry kilns, a distance of 250 ft. from the mill. Here the lumber passes down an incline, when it is carried 100 feet further to the ready sizer and shiplap machines. On passing through these finishers the lumber is delivered to another set of sorting chains which convey it 150 feet forward to the piling ground. Lumber not intended for the trimmers passes down the live rolls to steam swing-up saws, where it is trimmed, and then out to the rear end platform, which is equipped with transfers and turntable cars so that stock may be delivered to the planer, the car-loading deck or the cargo dock with equal facility.

Electrically Equipped Planing Mill

The planing mill is 196 x 168 feet in size, and is situated about 250 feet west of the main building. It is one storey, and has a cupola roof for downward lighting. Seventeen or eighteen machines of most modern type are installed, all connected up with individual motors. Six modern dry kilns are erected close to the planing mill to take care of the output of lumber. After passing through the planers, etc., the finished timber is stored in large dry sheds fitted with convenient racks for the handling of the different qualities.

The huge refuse burner, situated about 160 feet north of the main building, close to the power house, is built of heavy steel plate and lined with fire brick. It is 120 feet in height, 43 feet in diameter,

and rests on a solid cement foundation extending to bed rock. The burner was built by Paul Hopkins, an expert from Ballard (Wash.). About 400 feet of refuse transfer chain will be in use. A feature is the overhead wood mill on a platform alongside the refuse conveyor. The mill is equipped with saws to cut slabs into desired lengths, and has transfer chains to convey 16-in. wood to hoppers and the 4-ft. slabs to cars.

The mill filing room is deserving of special mention. It has a full equipment of the latest Covell machinery, driven by an alternating motor while the mill is in operation, and by a direct current motor when the mill is down, power for the latter being taken from a steam-driven exciter set installed in the power house in connection with the big turbine. There is also a power hoist for use when the filer and his assistants are changing saws. A railed-in platform extends overhead from the filing room to the rear of the mill, in order that saws may be carried back and lowered to their respective machines. This elevated passageway serves a double purpose, inasmuch as visitors may use it as a point from which may be gained a splendid view of the operations on the mill floor.

The lath mill contains a complete outfit of machinery required to produce an output of 50,000 pieces in ten hours, or 100,000 in twenty hours.

Mr. F. L. Buckley, one of the best known lumbermen on the Pacific Coast, is managing director of the corporation, and has charge of all the operations in British Columbia.

The Yellow Pine Trade Situation

Interesting Views of a Leading Manufacturer from the South Yellow Pine Production Will Soon Decline

Mr. R. A. Long, president and general manager of the Long-Bell Lumber Company, Kansas City, Mo., U.S.A., probably the largest manufacturers of yellow pine in the United States, recently visited Toronto and although extremely busy during his stay in the city was pleased to favor the Canada Lumberman with an interview upon the yellow pine situation.

It was pointed out to Mr. Long that Canadians were greatly interested in the yellow pine situation on account of the extensive importations of yellow pine into this country. In view of this, Mr. Long was asked to express his opinion regarding the output of yellow pine, the available supply of standing timber, manufacturing costs, market conditions in the United States, etc. In reply Mr. Long said:—"The output of yellow pine in the United States is in excess of the demand, as a result of which our prices are very low, and I might say, very close to the cost line; and in my opinion, where logging conditions are very expensive, some manufacturers are not securing cost out of their product, reckoning their timber at reasonable values."

It was pointed out further to Mr. Long that there was a general feeling among Canadian manufacturers of lumber that the manufacturers of yellow pine were dumping their product in Canada and selling it at a price lower than the price which they were obtaining in the United States markets. Mr. Long was strongly of the opinion that this was a mistaken view of the situation. "I do not believe," he said, "that you are correct in assuming that our manufacturers are shipping lumber into your country at lower prices than they are selling for at home, for I know that prices in our home markets are very badly demoralized."

Another matter regarding which Mr. Long was asked his opinion had to do with the output of yellow pine and the available supply of standing timber. Mr. Long's remarks upon this subject were as follows:—"It is believed by those best posted, that the maximum production of yellow pine has been reached, i.e., that we will likely never manufacture as much yellow pine lumber in a given year in the yellow pine district as (I should say) in the year 1909. The present volume however, will likely continue for some four or five years. After that the reduction in the output will become more noticeable annually, and within fifteen years we will not be producing more than one-fifth as much lumber as we are producing to-day."

C. L. A. Annual to be Held on February 3rd

The 6th annual meeting and banquet of the Canadian Lumbermen's Association will be held at Ottawa on Tuesday, February 3rd, 1914. In connection with the banquet, it has been decided this year that members may invite their lady friends. This is confidently expected to make the banquet a much more brilliant affair than usual. Reduced fares have been arranged for on all railroads in Canada east of and including Fort William, Ont., and application has been made for reduced rates from all points west of Fort William. Further particulars may be had from the secretary of the Canadian Lumbermen's Association, Castle Building, Ottawa.

Planers in the New Westminster Mill

Canada's Trade in Lumber With U. S.

Statistics for Year Ending March 31st Show Balance in Favor of U. S.—
Interesting Details of Movement Across Border

The accompanying tables showing the imports and exports of forest products between Canada and the United States during the years ending March 31st, 1913, 1912 and 1911, were recently sent out to the members of the Canadian Lumbermen's Association, by its secretary at Ottawa. A few of the statistics included in the tables deserves special attention. In the first place it will be noted that exports of forest products from Canada during the year ending March 31st, 1913, were valued at \$23,319,906, whereas the imports of forest products, dutiable and free from the United States were valued at \$27,159,607. During 1912 the totals of imports and exports were al-

been slowly declining in the face of the tariff of 50 cents per thousand collected upon them. In spite of this, however, the decline has been quite small.

The great amount of railroad building in progress in Canada during recent years is indicated by the fact that a large quantity of railway ties have been imported. The total under the heading of fence posts and railway ties for 1913 was 11,856,713, an increase of nearly \$750,000 as compared with 1912.

Pitch pine imports are shown to have more than overcome the decrease which occurred in 1912, the total imports for the year ending

		84,057		71,771		83,274	
Total Canadian and foreign		\$22,828,607		\$19,947,361		\$23,319,906	

most identical each being over \$19,500,000. In 1911 the exports exceeded the imports considerably, amounting to \$22,828,607, whereas the value of the imports was \$16,447,849. The natural conclusion is that the balance of trade in connection with forest products, which for many years has been in favor of Canada has now altered and favors the United States.

Imports of planks and boards free of duty have nearly doubled since 1911. The figures are as follows:—1913, \$6,087,560; 1912, \$4,984,737; 1911, \$3,496,496. Canada's exports of planks and boards to the United States show a slight increase over 1911 and a considerable increase over 1912, the values being: 1913, \$16,247,450; 1912, \$13,634,083; 1911, \$15,948,790.

The exports of shingles from Canada to the United States have

March 31st, 1913, being valued at \$2,435,376, as compared with \$1,929,923 in 1912 and \$2,111,818 in 1911. Oak continued to be imported in large and increasing quantities, the figures being as follows:—1913, \$3,218,870; 1912, \$2,411,766; 1911, \$2,316,618.

An interesting fact is shown in connection with veneers. The imports of this highly manufactured class of lumber product have shown an important increase. These have been subject to duty of 7½ per cent. and the imports were:—1913, \$354,283; 1912, \$295,589; 1911, \$298,822. Detailed statistics of imports and exports are shown in the following tables:—

J. A. Bernard, Montreal representative of the Seaman, Kent Company, Limited, Meaford, Ont., made a business visit to Toronto.

Motor Drive in Pulp and Paper Mills

Individual Electric Drive Effecting Important Economies in an Important Industry
Closely Allied to Lumbering—Various Processes Described

By Alvin Schlarbaum, B. A. Sc.*

WITH the universal adoption of individual motor drive both in steam and water turbine plants, the pulp and paper industry has within the past three years made rapid progress in this respect.

While it is true that in many cases the first cost is greater, still in others a decided compromise is made by the saving in the size of the plant to be erected. Where before the arrangement of individual machines was, to a great extent, dependent upon the arrangement of the line shafting, it is now possible to arrange the machinery and motors to give the most satisfactory results, leaving the rest to the flexibility of the wiring and conduit.

There are instances also where it is necessary to retain sections of line shafting in some departments of a plant, but where it may be desirable to run only one or two departments. Motor drive in such instances is very convenient and often eliminates the necessity of running a large engine for but one department. Where night work is carried on to any great extent it is necessary to keep additional firemen, engines, etc. This is not the case where electric power can be obtained from some operating company. The maintenance and operating cost for motor drive is a minimum.

Other features incident to convenient operation are involved in the amount of speed variation obtainable. In the case of news print mills the necessity of easy acceleration upon starting and absolutely constant full speed are most important.

Although for some years the Laurentide Paper Company, at Grand Mere, P.Q., have been using motor drive on a number of their new machines, all their grinders are direct connected to waterwheels, which is the best arrangement when possible. The first company in Canada to adopt motor driven grinders was the Colonial Wood Products Company, at Thorold, followed by the Northumberland Pulp Company, at Campbellford, in July, 1910. In the fall of the same year the Union Bag & Paper Company, at Three Rivers, Que., started a 40-ton ground wood mill, which has been running steadily, and has since been increased to over 100 tons daily. Power in this instance was transmitted from Shawinigan Falls. The largest enterprise of this nature began operations in July, 1911, when the Powell River Paper Company, Powell River, B.C., opened their new plant. This mill is one of the largest on the continent, and was built by the Brooks-Scanlon lumber interests, costing over \$2,000,000. All structures are reinforced concrete and brick. Hydro-electric power from Powell River drives the mill, steam being used for the paper machine driers only. The capacity of the mill is 120 tons of pulp or 100 tons of news per day.

In addition to the above there have recently been completed, the Wayagamack Pulp & Paper Company's sulphite mill at Three Rivers, the Ontario & Minnesota Power Company, at Fort Francis, Ont., the East Canada Power & Pulp Company, Murray Bay, P.Q., the Ontario Paper Company, Thorold, Ont. (with ground wood mill entirely electrically driven, using 10,000 h.p. from Niagara Falls), and the Abitibi Pulp & Paper Company now under construction at Iroquois Falls in Northern Ontario. Both plants at Three Rivers have their own transformer sub-station, and get their power from the 110,000 volt transmission system of the Shawinigan Water & Power Co., Shawinigan Falls, P.Q.

From this it is at once evident that electrically driven pulp and paper mills are past the experimental stage inasmuch as in most cases extensions are either planned for the future or are now under way.

Depending upon the location, the costs of construction for large ground wood mills (making pulp only) vary from \$5,000 to \$6,000 per ton of daily output, these figures applying to direct waterwheel drive. For hydro-electric installations the cost of generators, switchboard, distribution system and increased size of power house add materially to the initial cost but give in return a system of control, operation and arrangement of plant that cannot be obtained in any other way. One plant which the writer knows of, required, by mechanical drive, nearly 2,300 h.p., but after the change over, the total motor load did not exceed 1,700 h.p. Even in this instance, some of the line shafting and belts remained, but as most of it was removed, this saving in power alone allowed a considerable increase in output without adding to

Lumbermen are taking an increasing financial interest in the pulp and paper industry. This discussion of some of its chief manufacturing features will be of timely interest to many.

the capacity of the generating station. Another good feature was the reduced maintenance cost, which as everyone knows is high enough at all times, but particularly so in the destructive dampness to be found in every pulp and paper mill.

Aside from the question of an efficient motor drive and low maintenance, the necessary conditions for successful operation might be summed up as follows:—

- (1) Sufficient waterpower or cheap electric power for present and future needs.
- (2) A convenient supply of wood, good timber limits, preferably spruce. Stemwood from 5 in. to 10 in. diameter is best.
- (3) Cheap freight, cheap wood and facilities for delivering same by water or rail to the mill.
- (4) Pure water, preferably spring water, though not absolutely necessary, except that by its use exceptionally clear pulp is obtained.
- (5) Cheap labor.

Pulp Manufacture

The three principal processes of pulp manufacture today are:—

1. The mechanical process.
2. The sulphite process (chemical).
3. The soda process (chemical).

Spruce, balsam, poplar, and hemlock chiefly comprise the woods used. Spruce, in virtue of its long fibre comprises about 58 per cent. of the mechanical pulp made, and 91 per cent. of the sulphite.

Owing to the fact that its cost of production is cheaper, ground wood pulp enters into the composition of most of the paper made, comprising about 61 per cent. of the total production. Approximately 37 per cent. is used for the sulphite process and the remainder for the soda. It should be noted the above figures apply more particularly to pulp made from spruce wood.

As only the mechanical process will be taken up here, a brief description of the others will suffice.

The Sulphite Process

This method yields the maximum amount of cellulose and is mainly applicable to the treatment of wood. It consists of heating the wood at a high temperature in an aqueous solution of SO_2 in which a suitable normal sulphite is dissolved. The sulphite combines with the organic encrusting materials surrounding the cellulose, forming soluble compounds and by-products, the separation of which is obtained by washing. The fluid used is known as "bisulphite liquor" and may contain either lime, magnesia, or soda as a base. The proportion of SO_2 to base varies considerably, existing generally in excess. The operations in the process of preparing this bisulphite liquor on a large scale consist in first producing SO_2 by burning sulphur (or brimstone) or pyrites (FeS_2) in the air, and secondly forming bisulphites by absorbing this SO_2 in water in the presence of one or more of the above bases or their corresponding carbonates.

Before treatment by this process the wood, after leaving the barker house, is conveyed to the chipper room and cut into pieces about $\frac{3}{8}$ in. or $\frac{1}{2}$ in. thick. The large conical top acid proof brick and cement lined digester tanks used, are first filled with the chips then covered with the bisulphite liquor and closed up. Steam is then admitted to the bottom of the digester until the temperature is about 140 deg. Fahrenheit. An average digester charge is about 12 tons. After about 8 or 10 hours cooking, the whole mass is forced under steam pressure into a large blow pit with perforated false bottom, to drain off the liquid contents and by-products, and also the wash water.

From this pit the pulp is taken by conveyors to the top of a large tank, and after the addition of enough water to make it flow readily it passes into the centre of a rotary cylindrical knotter where coarse pieces of wood and parts of knots are withheld while the pulp itself falls through the perforations into another tank below. At this point, if the pulp is made into paper it passes on to the beaters, Jordans, wet end of the paper machine, dryers, calender rolls, winders, and shipping room, respectively. If, on the other hand, the product is that of a sulphite pulp mill only, the pulp, after leaving the knotter, passes on to the flat screens, wet end of the drying machine, dryers and winders. Instead of being run into the drying machines, much of the pulp made, both ground wood and sulphite, is run through wet machines and then hydraulic presses before being shipped.

The Soda Process

This is the oldest method and consists of digesting the wood in caustic soda lye at temperatures ranging from 338 deg. to 355 deg. Fah., corresponding to a steam pressure of 100 lbs. to 130 lbs. per square inch. The yield of pulp varies indirectly with the proportion of caustic soda used, as in the preparation of straw cellulose. Originally the digesters were heated by direct fire, but nowadays injected high pressure steam is used, the boilers being either rotating spheres or upright stationary cylinders. In the latter case the heating is effected by injecting high pressure steam into the charge at the bottom of the digester while in the former the steam is injected through the trunnion ends.

The Ground Wood or Mechanical Process

By far the greater part of the pulp manufactured is obtained by means of the mechanical process, and in general answers the requirements of most of the paper used. The fibre thus obtained however, is

Fig. 1—Distribution Method for Three Sets of Three Phase Lines to a Feeder Switchboard

not so long as that obtained by the chemical methods, nor is it as strong even when made from the same wood. The cost of manufacture however, is comparatively low, especially where unlimited water power is available, and where the logs can be floated down stream to the wood yards. This last feature however, is important, regardless of what process of pulp manufacture is adopted.

Peeling the Logs

As soon as the logs have been sorted they are carried by conveyors to the saw mill where they are cut into 24 in. or 28 in. lengths according to the size of the grinders, and thence to the storage yard where the wood is left unbarked until ready for use. Another system of conveyors carries the wood from this storage yard to the barker room where it is peeled, and, if the wood be large, say 12 in. in diameter, split into smaller sizes. Between every two barkers, in case they are arranged right and left hand, a chute leads to a large hopper on the floor below, whence by conveyors it is carried from this pit, to the grinders. In a number of the large mills in Quebec, this hopper is placed over a large concrete tank about 20 ft. square. One side of this tank leads to a concrete trough about 4 ft. wide by 2 ft. deep. The trough extends the full length of the grinder room and floats the wood along to each machine. The rate of flow can be regulated by the delivery valve on the supply pump. From the barker room to the grinders but one man is necessary, and he can keep 30 or 40 grinders supplied without difficulty. One disadvantage of this arrangement is evident when the weather is very cold and the cold wood when thrown into the water from the hopper, becomes coated with ice, making difficult handling at the grinders. In general, the conveyor is best, but requires more attention.

Losses due to peeling vary from 15 to 30 per cent. Owing to the presence of so much dust in barker rooms, the motive power should be placed beneath the floor, or in an adjoining room, so that the belts and driving pulleys can be shrouded. Where the capacity of a plant warrants the expense of such an arrangement, the best possible service can be obtained. In general, the barker room is of such capacity that enough wood can be peeled in the day time to last over the night shift.

Losses in peeling are greater with sulphite pulp than ground wood, as in the former the knots are sometimes bored out so that a much purer and clearer pulp is obtained. The best paper is made from this pulp, which after bleaching is snow white.

Grinding the Wood

There are two methods of grinding, first, long grinding; second, cross-grinding. Most of the wood used is reduced by the former, the pulp from which is used for news print, envelopes, and documents, as the fibre is longer. Fine cross-ground pulp is used for general pur-

poses, though not so common in this country as in Europe. In general, pulp grinders are arranged with horizontal shafts, and lend themselves readily to direct connection to water wheels or electric motors. In Sweden, vertical shaft pulp grinders are used to some extent, in cases of high head, similar to the arrangement of units adopted by the Electric Development Company at Niagara Falls. This style of grinder has six or eight pockets instead of three as used in nearly all horizontal machines.

The standard pulp grindstone is 54 in. in diameter, by 28 in. wide, in which case it is adaptable for 24 in. wood.

Grinders ordinarily run at from 180 to 260 r.p.m., present day practice adopting the latter speed where motor drive is used. With a pressure of 60 lbs. per sq. in. a grinder with 14 in. diameter cylinder by 18 in. stroke will run through a pocket holding about 2½ cu. ft. spruce in 3½ minutes, with a grinder speed of 257 r.p.m.

To keep the stone cool and prevent it from burning the wood, two 1¼ in. water showers under 20 lb. pressure per sq. in. keep the temperature down to 130° Fahrenheit. As the pulp leaves the grinder pits additional water is added to thin it sufficiently to flow under slight head to the scraper plates. The showers on the grindstone must be carefully regulated so that the pulp does not become too thin, as the high peripheral speed of the grindstone would throw it out of the grinder pit. This is due to the practice of submerging about 12 in. of the outer radius of the stone in the water and pulp. Later European practice involves the use of a grinder which grinds the wood entirely under water.

When rating a grinder as a 7-ton machine, this figure implies 7 tons of air dry pulp per 24 hours. One man can handle two such machines, though, at 60 lb. pressure in the cylinders, it becomes difficult. Proper selection of the wood when filling the pocket, arranging it so that the wood cannot roll and ultimately bind, will save considerable trouble.

The life of the average grindstone with proper care is from 6 to 9 months, though a poor one may only last 3 months, if, due to a flaw, a piece breaks out of the stone. It is sharpened daily by means of a burr, fastened in a steady-rest at the back of the grinder. When the stone is too sharp it tears the wood too much, reduces it faster, but makes the pulp coarse.

Power Required For Grinders

A large amount of power is required by the ground wood process. To drive a grinder turning out 7 tons of air dry pulp per 24 hours requires a motor of at least 450 h.p. with a speed of 260 r.p.m. Wherever possible, if sufficient power is available, grinders are arranged in sets of two, three, or four, all on the same shaft direct connected to motor or turbine. When arranged in sets of two, the machines are made right and left hand, so that only one man is required to operate them. At the above speed, however, and with 60 lb.

Fig. 2—Individual Motor Drive in a Pulp mill

pressure in the cylinders it keeps one man busy supplying two, three pocket grinders. In some of the larger mills in Quebec province, the grinders are arranged in sets of four, but with this arrangement the wood has to be loaded on trucks and wheeled to the inmost grinders nearest the turbine, instead of being dumped directly off the conveyor from the barker room.

As the pulp leaves the grinders it flows by gravity over one or more inclined steel plates, about 5 ft. wide by 20 ft. long, and perforated with 5/8 in. holes. The number of such arrangements depend on the capacity of the mill. Scrapers fastened to an endless link chain at each end, slide over these plates at about 25 ft. per minute, carrying with them the chips which float in the pulp, the finer pulp falling through the screen into the stock pit below. White water showers from the wet machines assist in washing the pulp through the plate and keeping it from clogging. Continuity of the process is one of the

essentials to successful operation. Failure here would close down an entire plant. The stock now screened from the coarser refuse and chips is pumped into overhead tanks by a centrifugal pump. From these tanks the stock falls through 8 in. vertical pipes into the top of the centrifugal screens, where all the small slivers are removed. Centrifugal pulp screens consist of two concentric cylinders of 5 ft. and 3 ft. diameter. Within the inner one which is perforated, and made of copper to prevent rust, revolves a fan with vertical shaft. The outer cylinder forms the case, and is made of sheet iron. As the pulp enters at the top it falls against the blades of the revolving fan and is thrown against the inner side of the stationary perforated cylinder. The good pulp passes through the holes, while the slivers are washed out at the back of the machine. The perforations in the copper cylinder are generally .065 in. in diameter, though for coarser pulp .085 in. perforations

Fig 3.—A Convenient Method of Individual Motor Drive

are used. The refuse from these screens runs into a tailing screen by which means any waste is recovered. The operation of the screens is very simple and gives no trouble at all.

Many mills still employ the flat screen, which, in the opinion of some pulp and paper makers is still the best, though its operation requires constant attendance. It is made of a 3 ft. x 7 ft. long brass plate perforated with slits about .013 in. wide. This plate is mounted in an open top box a few inches from the bottom. The bottom is made of heavy rubber cloth, supported and fastened along the centre to blocks which are agitated by means of small eccentrics on the driving shaft below. The short vertical vibrations of this rubber diaphragm draw the pulp from the top of the brass plate and through it, leaving the slivers on top. Screens of this type are arranged in a gradually rising series. The pulp which fails to pass through the first and highest screen runs to the second which is about 4 in. lower, and so on. The tendency of these machines is to clog, and for this reason steam jets from flexible hose nozzles are turned on by the screen men from time to time. Owing to the nature of its operation it will be noticed that a much smaller slit is used in the flat screen than is used to let the same quality of pulp through a centrifugal screen.

By the use of centrifugal screens great saving in building space is obtained. As the stock leaves the screens the consistency is about 300 to 400. At this point the stock can either be run into concentrators and thickened for use in the beaters if it is to be made into paper, or it can be run to the wet machines and prepared for storage or shipment. Three such machines can handle the stock from 4-7 ton grinders. They are usually belt driven at a speed of 450 r.p.m., though a neater arrangement is obtained by motor drive. Each screen requires about 15 h.p. when handling about 10 tons of air dry pulp per 24 hours.

Pressing the Pulp

As the pulp leaves the screens it runs into a long head box from which as many wet machines are fed as can handle the supply. These machines consist of a 6 ft. long by 30 in. diameter horizontal cylinder, which revolves in an open top tank. The frame of this cylinder or mold as it is called is made up of a large number of "spiders" on a 2 15-16 in. shaft. Around this skeleton mold is secured a very close brass wire cloth. The upper surface of the mold is slightly raised above the top of the mold box, which runs full of stock to within an inch or two from the top. As this mold revolves in the stock the water passes through it and flows by gravity into the white water pit from which it is again pumped into the grinder room and used to shower the grinder stoves.

The water passing through the mold leaves the pulp on the surface until it passes under the felt on the couch roll. The couch roll rests on the mold and therefore revolves with it at the same peripheral speed. Due to the weight of the couch roll, the felt, which runs around it, and between it and the mold, like a belt, carries the pulp on its

outer surface, overhead and forward to the heavy press rolls in the front part of the machine. The felt passes between them, goes around the lower roll which is faced with wood, and returns to the couch roll at the remote end. As the felt passes through the press rolls the pulp adheres to the upper roll and winds around it in a continuous thickening layer until it is cut by the operator. The broken sheet then rolls out on the folding table in the front of the machine. It is then folded by the operator and placed on a low truck or, as in some plants, on an 18-in. belt conveyor. The usual size of press rolls is about 18 in. diameter by 6 ft. long. The upper rolls weigh 1,800 lbs. and additional pressure is obtained by means of compression springs and weighted levers. The pressure between the rolls must be carefully regulated, as, otherwise the pulp will crush and not pass through with the felt and wind on the upper roll.

The felt on these machines lasts about three weeks. Under good conditions pulp can leave the press rolls 40 per cent. dry. In ground wood mills, wet machines are generally installed of such capacity as to handle the output of one grinder. Wet machines are well adapted to individual motor drive, or by shrouded belt from a motor driven line shaft from beneath the floor. The latter arrangement is the better, and gives good service in Thorold mills. For individual motor drive greater care is necessary to keep the clear water sprays off the motors unless a special case is provided.

Owing to the pressure of so much moisture in the pulp it is economical to press out as much of the water as possible if it is to be shipped by rail. In such cases the pressmen place the pulp upon very low trucks which, when full are run to the hydraulic press room. The sheets of pulp are here restocked, putting a wire screen separator between each layer of pulp. After pressing, the presence of the wire screen separators allows easy handling of the pulp which is now run to the shipping room or storage house. Pulp which before pressing is 40 per cent. dry is generally 55 per cent. dry after it leaves the hydraulic press.

The percentage weights of sulphite and ground wood pulp from a cord of peeled wood are widely different. It will require about 11/10 cords of peeled spruce to make 2,240 lbs. of air dry (10 per cent. water) pulp. To make 2,240 lbs. of air dry sulphite pulp it would require about 2 1/4 cords allowing 3,000 lbs. as the average weight of a cord of peeled spruce. Average air dry pulp contains 10 per cent. water but varies quickly with atmospheric conditions.

The Power Problem

A definite statement as to the amount of power required for any particular installation might be quite erroneous if applied to some other where, though the finished product be exactly the same, the existing conditions are different. There is also the question of speeds adopted, and the location of the different departments of a plant which must necessarily determine what distribution will best meet the requirements. One feature of prime importance to the pulp and paper industry is the continuity of the process. A shut down of one department affects the others in rapid succession. Up to the present, high tension power transmission has not proved itself free from interruptions to service hence pulp and paper manufacturers who do not generate their own hydro-electric power prefer to have a steam auxiliary. For this reason the nearer the plant is to the power site, the safer the installation against shut down. The weak point is not in the generat-

Fig 4—Direct Connected Jordan Engine

ing station but in the transmission line. Its susceptibility to lightning, and wind, even with duplicated lines, makes it uncertain. In the case of the hydro-electric generating station, proper selection of the site, sufficient pondage above the intake to submerge all rapids and thereby prevent formation of frazil, and the provision of spare generating and transforming units are elements of design which will ensure continuous operation. Whenever the location permits it, the intake and racks should always be placed at such an angle to the direction of the river that the tendency will be to carry all floating logs, ice, etc., past the rocks and over the ice run with but little assistance, and that only during conditions of flood.

Many plants, buying their power from some outside source which

has no alternative steam or other auxiliary of its own, prefer to have their own steam reserve. Such a condition necessitates an alternative bus arrangement, with double throw switches on each feeder panel. Thus the change over from one power to another can be made in an instant.

It will be found that in general, the distribution system for a sulphite mill should be carried outside on overhead trestles, keeping as much of the wiring as possible, out of doors. With ground wood and news mills, an inside conduit system will give good results. A transformer station with three sets of 3-phase lines to a feeder switchboard is shown in Fig. 1, and represents one method of distribution. An average of the amount of power required by some of the machines used in the pulp and paper industry is given below.

1. Three pocket, 7 tons per day grinder, running at 260 r.p.m. with 60 lb. per sq. in. in cylinders .. 450 h.p.
2. Slasher ... 25 h.p.
3. Barker ... 15 h.p.
4. Centrifugal screen ... 15 h.p.
5. Wet machine ... 12 h.p.
6. Beater ... 35 h.p.
7. Jordan engine ... 50 h.p.
8. Paper machine ... 225 h.p.
9. Conveyors (depending on size and capacity) 5 to 100 h.p.
10. Centrifugal pumps (depending on size and capacity) 5 to 150 h.p.
11. Carpenter shop ... 25 h.p.
12. Machine shop ... 20 h.p.

In all the above instances, except item 8, 3-phase induction motors give the best service. With paper machines however, the necessary

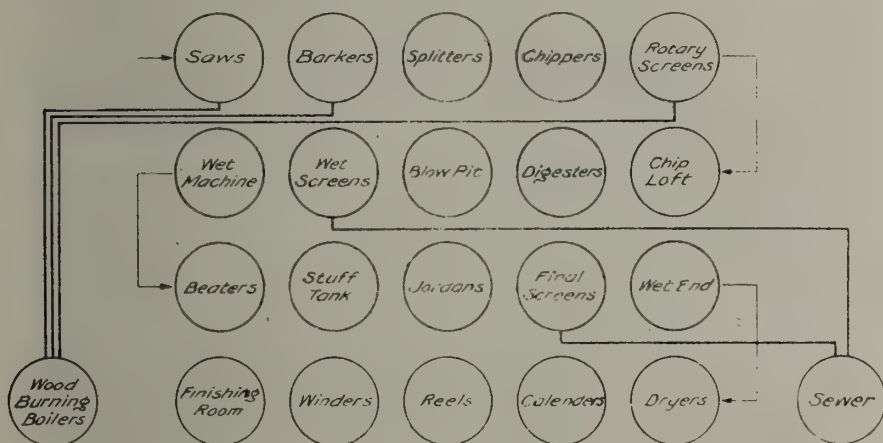

Fig. 5—Diagram of Successive Steps in Sulphite Paper Making

line speed control can be obtained better by direct current which requires the installation of a motor generator set.

The beater room, wet machine and flat screen room floors are not good places to instal a motor. Where possible an arrangement of belt drive should always be made from a line shaft on the floor below. This shaft may be either direct connected through flexible coupling and friction clutch, or belt driven from the motor pulley. In some plants the beaters and wet machines are not placed in a continuous line, and in such cases individual motor drive is adopted as seen in Fig. 2, though the motor would be in a much better position were there a basement in which it could be placed.

Fig. 3 shows a convenient method of individual motor drive for centrifugal screens.

Fig. 4. A convenient method of direct connected Jordan engine is illustrated in Fig. 4. By this means the shaft has an end play of $2\frac{1}{2}$ in. on other side of the centre. The motor is made with sliding base so that when actuated by a threaded shaft geared to the Jordan adjusting hand wheel, the rotor is not displaced by changes in the Jordan, nor its efficiency in any way impaired.

Fig. 5 shows the successive steps in sulphite paper making from the saw mill to the shipping room.

The Hon. W. R. Ross, Minister of Lands for British Columbia, upon his return recently from a trip through the province during which he received a number of deputations from lumbermen who discussed the question of increasing the royalty upon timber, pointed out that the lumbermen of the province would still have ample opportunity for stating their case further. Before any new legislation is announced the Minister intends to acquaint the lumbering industry with the conclusions which he has reached, so that they may make any further representations or objections which they consider necessary, before an amendment to the forest act is introduced in the Legislature. Arrangements are being made for the appointment of committees from the coast and interior lumbermen, who will hold further conferences with the Minister. Hon. Mr. Ross promises that the question will be settled as speedily as possible.

Side Lines in the Lumber Trade

By F. R. Anglin

By "Side Lines" we understand such articles of merchandise as fire wood, coal, plaster, brick, cement, wall boards, ready roofing, steel shingles and factory products.

The task of deciding what additional lines to carry must be performed by each merchant for himself according to his location and environment.

The shop-keeper of a village or small town usually carries a miscellaneous stock of merchandise consisting of dry goods, groceries, drugs, hardware, boots and shoes, etc.

The lumberman is obliged to do business on the same principle. If he be located in a country place where his patronage is small, he can improve his business by adding to the number of lines he carries. In fact it is essential for him to do so in order to be kept busy and to make enough to pay his living expenses and save a little money. If on the other hand, he be located in a populous and prosperous community, he may build up a very lucrative business in lumber alone and possibly add such other lines as he can handle without much extra trouble. If he is not satisfied with the amount of business he is getting it would be advisable to extend his business by circularizing, advertising and soliciting in order to reach a wider field and secure larger patronage. This would be better than dividing his attention amongst a number of different lines of goods and being compelled to prepare information and price lists on various items which would involve the employment of extra clerks and render his book-keeping more difficult.

To the man who contemplates installing machinery in order to do ripping and dressing and other machine work, we would point out that the initial expense is the smallest item. There is a strong temptation to add other machinery in order to please his customers, and in the end the outlay is very much larger than was anticipated.

Now that lumber is being shipped such long distances, the manufacturer can often deliver the planed and matched goods as cheaply as the rough, and for this reason it does not pay the retail dealer to put his capital in machinery.

The difficulties of running a manufacturing plant are very many. One requires a knowledge of machinery, highly paid workmen, a skilled estimator and a cost system. In addition to that, there are the troubles of mistakes on the part of the customers, and his workmen, which in the end reduce his profits to a minimum. In view of these facts one should proceed very cautiously in the matter of adding a mill or factory to his lumber trade.

The tendency of the times is to specialize in everything, consequently we may lay it down as a rule, that it is much better to increase the volume of business rather than the number of lines of goods.

On the other hand, there are large concerns today doing a profitable business, and handling various lines of merchandise but they require most efficient and experienced management, several departments, and unlimited capital. Where these can be obtained there is no doubt that there is room for profit in handling other lines.

As mentioned above, the man who contemplates extending his business by the addition of "side lines" must be his own judge and his decision must rest upon his ability, his resources, his experience and the possibilities of the locality in which he is situated.

Waste from Desks Go into Brushes

Waste wood produced in the manufacture of school desks is now being used for the backs of cheap brushes, according to the statement of the United States Forest Service. A large manufacturer of school desks in Michigan had a considerable amount of waste material in sizes which were too short to enter into the manufacture of the smallest desks, and could not be utilized further with his machinery or in his line of work. This material was all hard maple in pieces an inch thick, a foot or so long, and about three inches wide; for a long time it had been consigned to the waste pile and sold as firewood. This waste amounted to from one thousand to fifteen hundred board feet each day. A nearby manufacturer was using practically this quantity of maple, which he was sawing up into small pieces for making the backs of cheap brushes. Members of the forest service, investigating methods of eliminating factory waste, conceived the idea that the blocks used by the brush factory could be readily secured from the waste of the school desk manufacturer, and on this basis got the two together. Arrangements were made so that the brush manufacturer now places orders with the other firm for its raw material and what was formerly waste is now a source of profit.

The Reader's Viewpoint on Trade Topics

Opinions on Questions of General Interest—B. C. Lumberman Criticizes Business Methods in the West—Waste Problem Discussed

Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few that have been received lately:—

A Talk with the Lumbermen of British Columbia

By Douglas Fir

Never, perhaps, was the pride of our brethren more humiliated, nor the heart more completely subdued and prepared to receive the seed of admonition than at the present time. And so, as the preacher never misses an opportunity to admonish those who are in sore distress, and point out to them the error of their ways, and what will happen to them if they do not change their tactics, it seems appropriate that a few words might quite properly be addressed to our brethren now, lest greater evil might prevail amongst us. We are told by the Apostle Paul that "The love of money is the root of all evil; which while some coveted after, they have erred from the faith, and pierced themselves through with many sorrows." Now isn't this true? and would it not have seemed quite appropriate if this had been called "The Epistle of Paul, the Apostle, to the Lumbermen of B.C.?" If Paul had said that money itself was the root of all evil, then it would not have applied to us; but when he tells us that it is the love of money that is the root, then he hits us, and hits us hard, because it is a truth that our ardent love for money precludes any possibility of our ever having any, and this is where Paul's words get in their sting, for if we had not erred so often we might have made some real money in the past few years, and if we could have done this, perhaps our love for it would not be so great, for you know the thrill of anticipation often sinks deeper into our mortal being than that caused by the realization of a thing. This fact is clearly proven in the land of divorces. A young man thinks he loves the object of his affections very dearly until she is his, and then he finds that he does not love her nearly so much as he thought he did, or vice versa. This seems to be human nature. Another name for it would be covetousness.

Why Does Overproduction Continue?

But to get back to our text; who can deny that the love of money has done much to bring about the state of affairs which exists to-day? What makes us run our mills day and night in the face of a declining market, and send men chasing after business to enable us to do this? And the faster business flees from us, the harder we pursue it. It cannot be said that it is to supply a demand for lumber that we do this, nor yet do I think that we are ready to say that it is with a view of providing work for idle men that we do it; so what is it, if it is not the love of money that goads us along? We grab, with a desire to get the lions' share of something that in our visionary anticipations looks good, but which rarely amounts to much in realization, for it is right here, while in this state of frenzy that we, through our love for money, and by our unmeasured enthusiasm remove any possibility of making any, and while we pierce ourselves through with many sorrows, the interested public looks on and smiles complacently at our unbusinesslike tactics. It makes one who sees the situation in the light in which the writer sees it, recall the fable of the small boy pelting the frogs; and to use the frog's version, it may be sport for the public, or that faction which is being benefitted, but it is death to the industry.

Trade Excitement a Dangerous Feature

I never was able to see, and I have been in the business for a number of years, why we should get excited just as soon as there are signs of life in the demand for our product, but isn't it true that this is just the very thing that happens? Let a tight rope walker get excited and what would happen? Or let a sailor get "rattled" in the rigging, or a swimmer, let him be ever so good, or the hunter when he takes aim on some object. In anything in which we engage is it not the man who uses due deliberation, and who balances it with good judgment that gets what he aims at with any degree of satisfaction? Well then, if this is so in other walks of life why should it not be so in our walk? It should, my brother; but is it? Let a lumberman stop at the present day to use deliberation in landing an order, and while he is deliberating, it would be riddled to pieces by the dozens who are standing ready to take a chance shot at anything that looks like business, and who close both eyes, and fire both barrels at once,

before they really know what they are shooting at. As a good illustration of this I know of a case where a dealer wanted a bill of lumber, and happened to get in touch with the manager of a mill and placed the order. Pretty soon an agent, or salesman from that same mill dropped into that man's office, and upon learning that there was game there got excited and began to "shoot." The dealer finally informed him that he had about placed the order at a certain price, naming the price at which he had bought it, when to his surprise the salesman immediately offered to write up the order at fifty cents per thousand less, and by gosh he did. He just beat that other fellow out of that order slicker than a whistle. Had the dealer told him it was his principal he was bidding against he probably would not have fired so wildly, but as it has been said, a chance shot will kill the devil, and so these fellows who shoot by random almost always get the game, and even if it isn't any good after they get it, they had the pleasure of taking it from the other fellow any way! It is a great game, is this game of ours.

It is a well known fact that there is no stability in the lumber business, nor has there been for years, and this is a condition which should not exist. But just as long as this insatiable greed mingled with unmeasured enthusiasm exists, and as long as boys are sent out on men's errands as is too often the case in this business, just so long will we have instability in the business, until such time as the demand is unequal to any possibility of supply. How many men are there in the business of selling lumber to-day, comparatively speaking, who ever stop and figure out what it costs to produce a certain line which they are trying to sell, assuming that they are able to do so?

Common Sense in Great Demand

Personally, I believe that if we cannot maintain a fair and uniform price, we should have honest competition, but do not let us resort to any unfair tactics. Paul tells us at another time that "All have sinned and fell short." And still again we are told that "All men are liars." So this being so, it is not to be wondered at that there is distrust in the ranks to-day, and that when any new suggestion is brought forward it is liable to cause suspicion in the minds of those who have endeavored to walk near the path of virtue in the past, and where suspicion lurks, doubt is, and doubt is a dangerous perplexity.

"The Yankee got rich by minding his own business," is another proverb. I do not know who the author is, nor am I absolutely sure that it would make us rich were we to follow it. There is nothing better to mix into our business however, than good commonsense, mingled with good judgment. I think it is pretty well known to most of us now, that there is no use in under-quoting with a view to satisfying the customer, or even selling more lumber. I believe I am safe in saying that there would be just as much, if not more lumber used if the prices were maintained, than when prices are being slaughtered, because the latter is an open acknowledgement that we have not confidence, and our customer is ever ready to take advantage of our weakness, no matter how low we go, and then, when our neighbor goes lower he goes there, and who can blame him? The fault is our own.

Important Methods of Avoiding Wood Waste

Editor Canada Lumberman:

Kinmount, Ont. Oct 15

We have read carefully Mr. Charles Allen's letter in the October issue of your journal on the subject of waste reduction. We note that he refers chiefly to the waste in small tops of trees. This matter is important and should be considered seriously by all who may be engaged in the manufacture of lumber, but unfortunately there are other sources of waste in connection with timber operations, besides the leaving of small tops, which are, in my opinion, much more serious and of greater magnitude. The small tops can be cut and taken care of as he suggests, but you cannot go back over the ground and take the high stumps that are left when cutting down the trees and make them into logs. In almost any bush you may go into, you will see stumps from 18 inches to three feet high, the largest part of the tree and generally the soundest part of it. In a stump even 18 inches high, if one foot were cut off as part of the first log, in twelve stumps you would have a 12-foot log from the largest part of the tree. That log could be worth twenty small tops. Just think what would or could be saved in three-foot stumps.

Another source of waste and in my opinion a greater waste than even small tops or stumps, is the loss of logs by sinking in the deep waters of the lakes and streams by which they have to be driven to the mills. This journey in many cases covers a whole summer before the logs can be taken out and cut into lumber. My own experience during twenty-five years' operations in

timber cutting and driving to the mill has proven beyond any doubt that there is no timber grown or cut into logs for sawmills that will not sink or at least a percentage, with perhaps the exception of cedar, especially timber that is cut down during the late fall and winter months, the time of the year when a large majority of lumbermen of the present day do their cutting, with the exception of hemlock, which is generally peeled to get the bark for the tanners.

How can these two great wastes be avoided? By cutting down the trees during the summer months, commencing as soon as the winter's snow is gone, there is only one tree that is liable to damage by worms, the white pine; it is a light floater and can be left until fall. Give your foreman strict orders to cut all trees down at the roots and see that he does it. Cut every tree, except basswood and elm, into logs. They will dry and not suffer in any way. Peel a strip off all basswood from butt to top and leave the cutting into logs until fall. It will dry out and float a year and take no injury. Cut logs from 8 to 16 feet, which will, in nearly every tree, give you straight logs. Save waste in the mill as crooked logs only make slabs. We cut tops down to four inches and take up all skids when hauling, if floatable. Small tops we make into pulp stock, excelsior, staves or heading, from many of the woods that are now being cut for the manufacture of lumber. The above has been our plan of sawing some of the waste for many years. It may not be new to many in the lumber trade, but there are a great many who do not do so. What I have written may not be pointers for Mr. Allen but may be of value to some of your readers. Mr. Allen is on the right track. J. Austin.

Sawmill Waste Would Make Manufacturers Rich

Editor Canada Lumberman:—

Bathurst Village, N.B., Oct 8.

I have just read through the article appearing on pages 32 and 33 of the Canada Lumberman of October 1st, written by Mr. Chas. Allen, regarding the subject of waste in sawmill operations. The article is a very interesting one indeed and gives some very good suggestions that might well be adopted by many of the sawmill men all through the country. This is a line that the writer has been studying himself for some time and he has come to the conclusion that this matter needs the earnest, careful attention of all lumbermen the country over. There is no doubt at all, but that a great deal of waste takes place at the stump in the woods and then again when you come down to the swamill, there is a tremendous waste there. We are of the opinion that the large burners that are constructed at most sawmills, if they could speak, would tell a wonderful tale of the quantity of good material that they consume every year, about which the operator knows little or nothing. We have one of these burners at one of our mills here and we are going to tear it down, as we consider that they are a nuisance. The trouble we find with them is that when a piece of lumber goes into a burner you never know anything about it and it is gone for good.

It seems to me that what the mill men have to do is to work out some plan whereby every inch of slab or edging that comes from the mill and every grain of sawdust that they do not use for steam will be utilized in some way that will bring them in some profit. The writer has examined many mill operations down in this part of the world and he considers that there is enough of waste going from most of the mills through New Brunswick to make the owners rich, if they evolved some plan to utilize the power that might be produced from the refuse that is now being wasted.

Angus McLean.

Reducing Waste in the Woods

Editor Canada Lumberman:—October 10th.

Our opinion is that great savings can be made in the operations of mostly any of the mills in the country, and we think it is highly desirable that such savings should be made. The article by Chas. Allan in the Canada Lumberman of October 1st, however, refers more particularly to woods operations, and in one particular a point is brought out which we think is too often lost sight of, and if of the highest importance, namely, that of the cutting of logs in the woods. A fixed rule of making logs a certain length does not result in cutting the trees to best advantage. To get best results a variation should be permitted so as to enable, as far as possible, making the logs straight, cutting the sound and fine timber separate from the coarse and unsound timber to as great an extent as it can be done.

There is one point however, wherein we think the writer is vastly astray, and that is, that a saving can be made by taking out the very small tree-tops. This is a very serious and general error, as there are very few instances where very small logs can be made to pay the expense of taking them out. I think for instance, that it is safe to say that in the entire Ottawa Valley all logs under 10 in. taken out cause an economic waste, as they do not yield enough to pay the expense of handling them.

W. C. Edwards & Company, Limited.

Good Outlook for Next Year

Editor Canada Lumberman:—Penetanguishene, Ont., October 16th.

The outlook for next season's business is good and prices cannot afford to drop, as the increased cost of logging and manufacturing prohibits anyone making more than a new dollar for an old one. So far as we can see, the prices paid for stumpage at the last two sales cannot be realized by anyone. In regard to the lumber industry in the Georgian Bay district, the trend of the

times shows the quick destruction of the forests bordering this water. Mill after mill is shutting down and soon the mill will be a thing of the past, as it is in parts of Michigan today. Under these circumstances "King White Pine" may suffer a temporary setback, as it seems to be at present, but we cannot see how it can last, as most of the stock that is left is in Ontario, and it will soon come into its own again, as there is no question that it is the nicest stock to work that can be found.

C. Beck Manufacturing Company, Limited.

Fassett Lumber Company's Annual Meeting

The annual meeting of the stockholders of the Fassett Lumber Company, Limited, was held at Fassett, P.Q., on October 15th. The following officers were elected for the ensuing year:—President, J. Sloat Fassett, Elmira, N.Y.; vice-president, A. E. Edgcomb, Knoxville, P.Q.; secretary-treasurer, Harry S. Thayer, Elmira, N.Y.; manager, S. J. Staniforth, Fassett, P.Q. The annual report was very satisfactory, considering that the company lost their mill by fire on June 23rd. They started to build the new mill on July 12th and are installing a very complete and up-to-date mill, consisting of two 8-ft. bands, two edgers, slashers, and auto-trimmers. They will also have one 600 h.p. Corliss engine, besides a Canadian Westinghouse dynamo. All of their mill machinery is being supplied by Clark Bros. Company, Olean, N.Y. All the latest improvements are being included. They now expect to have the new mill ready by December 15th when they will start running night and day. The company have not curtailed their cut in the woods, but will have this year 24,000,000 ft., in addition to which they have 4,000,000 ft. of last year's logs which were on hand at the time of the fire.

Mr. R. O. Swezey, general manager of the forestry department of the Montreal Engineering Co., 164 St. James St., Montreal, has been a fairly frequent contributor to the columns of the Canada Lumberman. He is widely known to lumbermen and foresters, and has had experience in every lumbering district in Canada. His personal knowledge of limits, especially in the province of Quebec, enables him to report almost immediately on many limits, without incurring the expenditure of sending a party into the field. The company have a strong directorate, consisting of Messrs. A. R. Doble, F. P. Jones, V. M. Drury, R. O. Swezey, Fred E. Clarke and S. B. Hammond. The officials of the company are engaged in reporting on many important projects in many parts of America.

Price Brothers' Logging Arrangements

J. McDowall Grosart, Chicoutimi West, P.Q., manager of the logging department of the Kenogami mill of Price Bros. & Company, Limited, and of the Jonquiere Pulp Company, returned recently from the bush after having given out contracts for getting out sixty to sixty-five million feet of logs during the coming winter, for the use of these companies. The logs are being taken out in the Lake Kenogami and Lake St. John districts, and, carrying out the usual system of the firm, are being made by "small" jobbers, that is to say, the firm make contracts with the actual men who make the logs, not employing any middleman.

A Progressive Wire Products Company

The Laidlaw Bale-Tie Company, Limited, Hamilton, Ont., where they established their Canada plant fourteen years ago after many years of experience in the United States, have built up a large trade in wire and wire products. They have made a specialty of the production of wire for baling and bundling purposes and their product is of the very highest grade. The rapid increase in their trade recently made it necessary to secure new premises and their new plant which was finished this year is one of the best equipped wire mills on the continent, with a daily capacity of 100 tons. The company are the sole manufacturers for Canada of the Carnegie Steel Company's patent steel hoop for all slack cooperage, which has largely superseded the wooden hoop in the United States and is being extensively used in Canada. This hoop makes an important reduction in the cost of manufacturing slack cooperage and gives the best possible slack barrel.

A Valuable Harness Catalogue

The Maple Leaf Brand of harness for lumbermen, manufactured by S. & H. Borbridge, Ottawa, Ont., and Brandon, Man., is favorably known in all parts of Canada where lumbering is carried on. The company have been manufacturing these goods for the last seventy years. They have testimonials from customers who have used their harness for ten, twenty, thirty and even forty-five years and a great part of their business to-day is with old customers or their sons and grandsons. They carry a very large stock and make a specialty of prompt shipments in connection with telegraph and rush orders. An interesting special descriptive catalogue has recently been issued by the firm, giving prices and details in connection with their principal lines.

Unique System for Order Despatching

Graphic Boards Arranged to Show at a Glance Exact State of Shipping Department's Daily Business Transactions

The accompanying illustrations show an interesting new order-planning board and dispatching system, which was recently installed by a large lumber manufacturing company in the Southern States. The board has already shown remarkable results in facilitating prompt shipments.

In the general or main offices there are three of these planning boards, two of which are illustrated in the engraving herewith. Each board has a surface of 5 feet 3 inches vertically and 7 feet 1 inch horizontally, and carries three separate sections. The top of one of these sections is shown by the other cut. This section carries shed orders; still another, yard orders; a third, export timbers and lumber; lath and shingles are also in separate sections or divisions.

The board takes care of carload shipments, and the orders are listed by typewriter upon a strip of paper, which is placed in the column at the left, $4\frac{1}{2}$ inches wide. The right hand portion of the section is ruled into squares approximately three-fourths inch in size, the first tier being blank and thirty-one additional numbered tiers covering the days of the month. The photographs were taken on July 7, as indicated by the heavy cord stretched vertically upon the board, which is shifted each morning.

General View of two of the three Planning Boards.

After the order has been received and credit O. K'd. by the assistant treasurer, it is written up on the regular order blank in five copies, each of a different color, in addition to the original copy, making six in all. These go respectively to the auditor, shipping department, general manager, sales department, salesman who sent in the order and the customer. In the shipping department a tally card is made up from the order, which is turned over to the planning and dispatching department. This department refers the order to a perpetual stock inventory, which shows not only the amount of stock on hand, but its condition as to length of seasoning. From this knowledge the planning department sets date for

shipment of cars in the order, the order being placed on the board through the medium of a typewritten slip, and pins are set opposite to it in the date or dates on which the cars are to be shipped. For this purpose red and yellow pins are used, the red pins indicating rush orders which must be given special attention, while the yellow pins do not indicate any particular urgency. It will be noted on the second line of the detail cut that five carloads are included in the order. The first car is wanted in a hurry, is a day overdue, and is shown in red. There is a similar red pin upon the third line, but the yellow pin under the order number at the left shows that this car is being loaded at the present time. On the first line the order originally included five cars, three of which have been shipped as indicated by the tally marks on the right of the typewritten slips, while the fourth is now being loaded, as indicated by the yellow pin on the left. When an order is completed a green pin is set in the blank column immediately following the order. Three such instances are shown at the bottom of the sheet.

On each of these three boards there is space to record 78 orders. As orders are filled, and additional space is required on the board, the typewritten list of orders is rewritten, or partly rewritten in order to close up the orders and omit the ones which have been completed, giving additional space for new orders. This involves a re-setting of pins to align with the new list.

How the Plan is Worked

Each morning the division heads of the shipping department (lumber shed, lumber yard and timber dock) receive a notice from the planning department as to shipments overdue, shipments due on current date, and shipments coming due within the next four days. At 4.30 p.m. a planning meeting is held in each department; that held in the shed will serve as an illustration. It is held in the shipping clerk's office in the dressed lumber shed and is attended by the assistant superintendent, the planing mill foreman, the planing mill "send-in" man and the shipping clerk himself. The shipments for the

Detail View, part of one section of a Board.

following day are taken up, and the work necessary to be done in the planing mill on each shipment is entered upon a "planing mill planning sheet." This gives the order number, description of order, the machines on which the work is to be done, the number of thousand feet and the estimated number of hours required. These orders are entered upon the planning sheet in sequence as they are wanted for shipment, and copies are given to each man in attendance at the meeting.

Advantages of the System

The advantages of such a system of handling orders are so obvious as hardly to require enumeration. It keeps constantly before all the men co-operating to get out shipments exact current requirements necessary to fulfill promises. The planning board visualizes overdue, current and coming due shipments in the most emphatic way possible, and stimulates the production of maximum results. It also enables an intelligent estimation of the time at which a carload can be reasonably promised and restrains salesmen from promising more than can be performed. To sum up, the results are better service and satisfaction to the customer, greater economy of operation, greater efficiency of supervision.

The board perpetually provides for the planning of the orders at least three weeks in advance. As the end of the calendar month is approached the earlier columns of the board begin to be used for the first days of the coming month, so that on the 20th of July pins set for the 10th and 11th will represent the corresponding days in August. The boards are, of course, made of soft wood so that the pins may be easily inserted and removed.

From the foregoing description of this board, as used by this great lumber manufacturing concern, it will be seen that the principle is absolutely flexible and that such a board could be easily introduced to take care of the orders of a manufacturing, wholesaling or retailing establishment of any sort without any difficulty. The Great Southern Lumber Company is to be congratulated upon having probably the most simple and yet scientifically complete dispatching system which has been devised anywhere.—American Lumberman.

John M. Diver's Rapid Progress

John M. Diver, Detroit, Mich.

Mr. John M. Diver is becoming as dominant a figure in the lumber and timber trade of the United States as he was in Canada. Mr. Diver is now in the wholesale lumber business in Detroit with offices in the Hammond Building.

A "Canada Lumberman" representative spent a pleasant day with the former Sarnia lumber manufacturer last week, and found him as busy a man as ever. His business motto is "Everything in lumber." This means not only yard and factory stock but a complete line of cedar posts, piling telegraph poles, railroad ties and timber for railroad, construction and commercial purposes. He is shipping pine, fir, cypress, and hardwood lumber and timber to all parts of Canada and U. S. A.

Mr. Diver is also largely interested in the Yeomans Diver Company, one of the largest box factories in Detroit. The Yeomans-Diver Company is well known in the city of Detroit as one of the largest box corporations in the State, manufacturing boxes, box shooks, crates and crating. This branch of the business is under the supervision of Fred H. Yeomans, its secretary and treasurer, a life-long resident of Detroit, who has for years successfully handled the box business in the city. The company's property is situated at the foot of Lieb street, on the river, covering an area of about four acres. Its plant, located at 274 to 290 Wight street, with building built of brick four storeys high, is 250 feet long by 100 feet wide, with a power plant of 500 horse-power. The company have splendid dock facilities as well as railway connections, a switch running directly into their yard.

The Mack Axe Works, Beaver Falls, Pa., have appointed N. J. Dinnen & Company, of Winnipeg and Vancouver, as agents for Western Canada.

The Smart-Turner Machine Company, Limited, Hamilton, Ont., are supplying Messrs. George Gordon & Company, Cache Bay, Ont., with one of their Duplex Pumps.

Canadian Western's New Door Plant

Now Turning Out 600 Doors Daily—Modern Machinery and High Grade Lumber Produce a High-Class Product

Mr. H. J. Mackin, sales manager for the Canadian Western Lumber Company, Fraser Mills, B.C., paid a brief visit to Toronto recently upon business affairs connected with the company. Mr. Mackin reported that the large new door plant recently erected by the Canadian Western Lumber Company is now in operation and turning out about 600 doors per day, which is about sixty per cent. of the capacity of the plant. These doors are finding a market on the prairies and in Eastern Canada.

The commencement of operations at this plant is an event of much importance to the door manufacturing industry of Canada. The equipment of the plant is modern in every detail. All the machinery is electrically driven and the company state with pride that it is the most complete door plant in Canada. While it is not so large as some of the great door manufacturing plants in the United States, its equipment is just as perfect and in some respects even more so, as advantage has been taken of the experience of the largest plants in Washington and Oregon and thus the layout and installation of the machinery and equipment has been planned along the most modern and efficient lines.

The doors which are being turned out at this plant are not what might be termed ordinary British Columbia doors, as they are manufactured according to the American standards and grades. The fir door business has been more thoroughly developed in the States of Washington than anywhere else and the Canadian Western Lumber Company have adopted the methods of the Washington plants and improved upon them in several important features. The lumber production of the Canadian Western Lumber Company is so great that it enables them to select with great care such stock as they require for their door plant. Thus they are in a position to choose higher grades of stock and more suitable quality for the manufacture of doors than is the case at present with any fir door manufacturing company. It requires less than ten per cent. of the lumber manufactured in the Canadian Western Lumber Company's sawmill to take care of their door plant.

New Shingle Mill Also in Operation

The Canadian Western Lumber Company have also recently completed a shingle plant and during the past two months have been manufacturing an extra clear XXX shingle for the Eastern Canadian market. The equipment of the shingle plant consists of eleven electrically-driven upright shingle saws and one 2-block machine.

Shingle manufacturers in British Columbia are now expecting an advance in the price of shingles, justifying their expectation, Mr. Mackin states, by reason of the American tariff of 50c per thousand pieces being withdrawn under the new Wilson schedule. Already there have been a great many sales made for shipments to the New England States. The British Columbia shingle manufacturer is able to compete with American operators on the extra high grade shingles because cedar timber in British Columbia is of much superior quality and grows larger, thereby enabling them to get a larger percentage of the 18-in. and 24-in. clear shingles than can be obtained from the ordinary Washington timber. In the past, British Columbia shingle manufacturers exported and paid the 50c per thousand duty on a great many cargoes of shingles annually. The removal of the duty will give a welcome stimulus to the industry. A great many mills that have been manufacturing solely for the Canadian market will hereafter manufacture largely for the American markets.

Improvement Noted In Western Trade

Mr. Mackin reports that the market for lumber today is noticeably better than it was a few months ago, as a result of the very satisfactory crop in the northwest. After all, the prairie crop situation is the barometer of the lumber business in British Columbia. Building operations have been light this year because of the financial situation, and retail lumber yards have carried only hand-to-mouth stocks. After this year's crop was taken care of, active building conditions commenced to develop at country points, with the result that stocks on hand today are lower than they have been in years. The production of lumber both in the coast and mountain districts of British Columbia has been curtailed during the past six months, so that stocks at mill points are also low. Present indications are that there will be an increase in the amount of business for the manufacturers and wholesalers during the balance of this year and very good business in the spring. A good sign is the fact that the importation of lumber from the Western States into the prairies has lately shown some falling off, indicating an improvement in the markets in the United States.

Referring again to the fir door, Mr. Mackin said that it had been going into eastern Canada more extensively during the last few years than formerly. Up to that time, the fir doors used in Canada had been largely of American manufacture, owing to there having been no large door plant at the British Columbia coast.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

FOR SALE.—One of the most successful, best-equipped shingle plants in Vancouver, B.C. Owner wishes to retire. Can show net profits 20 to 40 per cent. over ten years. Steady demand for output—about 225,000 per day. United States market will be another big factor. Timber limits if desired. Less than \$20,000 will swing this plum—balance good terms. Apply editor, Western Lumberman, Vancouver, B.C., for particulars. 21-22

Miscellaneous

For Sale

Tugboat, 65 ft. over all, 14 ft. 3 in. beam, 8 ft. deep, fully equipped with winches, 10 and 20-in. compound engines, surface condensers and pumps. All connections and pipes brass and copper. Address T. N. McGrath, Tusket, N.S. 20-t.f.

MAIL CONTRACT

Sealed tenders, addressed to the Postmaster General, will be received at Ottawa until noon, on Friday the 7th of November, 1913, for the conveyance of His Majesty's Mails, on a proposed contract for four years, six times per week each way over Cheltenham and Rural Mail Route, from the Postmaster General's pleasure.

Printed notices containing information as to conditions of proposed contract may be seen and blank forms of tender may be obtained at the Post Offices of Cheltenham, and at the office of the Post Office Inspector, Toronto.

A. SUTHERLAND,

20-21 Post Office Inspector,
Post Office Inspector's Office,
Toronto, Sept. 24th, 1913.

Tenders for Pulpwood Limit

Tenders will be received by the undersigned up to and including Wednesday, the 31st of December next for the right to cut pulpwood on a certain area situated on the Metagami River in the District of Temiskaming.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the Crown dues of 40c per cord for Spruce, and 20c per cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario,—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario, for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into an agreement to carry out the conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,

Minister of Lands, Forests and Mines.
Toronto, Ont., Sept. 17, 1913. 20-24

Important Auction Sale of Valuable Pine Timber Limits

in the

**Townships of Hammell and
Merrick, District of Nipissing
and Province of Ontario.**

There will be offered for sale by public auction in the rotunda of the New Russell Hotel, in Ottawa, on Monday, the first day of December, 1913, at 2.30 o'clock p.m., the timber berths known as Berths No. 6 and No. 8 of the Township of Merrick, containing an area of 8¼ square miles more or less; also timber Berths Nos. 1, 2, 3, 4, 5, 6, 7, 8, and 9, in the Township of Hammell, containing an area of 27½ square miles, more or less.

The Temiskaming & Northern Ontario Railway runs across one corner of the lots in the Township of Merrick, while the Township of Hammell is situated on the waters of the Tomiko River, a tributary of the Sturgeon. These Berths are held by the vendors under renewable licenses from the Department of Lands, Forests & Mines of the Province of Ontario.

The Berths will be sold in two parcels. Other terms and conditions of payment will be made known at the time of sale. For further information apply to W. A. Cole, Auctioneer, Ottawa. 21-22

What Is a Planing Mill?

There is, even in the trade, the vaguest of ideas as to what constitutes a planing mill, says the Pioneer Western Lumberman. A seemingly correct definition is a mill operating machinery for the planing of lumber, that is reducing the surface of a board or timber rough from contact with a saw to a greater or less degree of smoothness.

Assuming this to be the case, the operator of a lumber yard conceives the idea, that it is foolish for him to send sizing and planing orders to a planing mill even though it is operated by one of his best customers, when to his understanding all he requires is an endless bed planer, a matcher and a self feed rip saw.

Action is stimulated by conference with a purveyor of machinery, who with ready wit points out the large saving that could be effected by operating such a plant in connection with the lumber business, and shortly thereafter appears a planked space with open sides and a shed roof, sheltering a few machines with a motor driven line of shafting, thereby eliminating the expense of a power plant, the whole surmounted by a sign reading "Hurry Up Lumber Company's Planing Mill."

To one who is at all familiar with the business, the limitations of such an equipment are self-evident and the real definition of a planing mill, is a factory with machinery and facilities for manufacturing anything that can be made from wood, with an organized force of estimators, draftsmen, foremen and mechanics, working in harmony under a manager who can say—"I have never turned down an order for an article made from wood, if the customer accepted my quotations his order was filled, even though it required the designing and

building of special machinery and the gathering of materials from the four corners of the earth.

Such an operator would have a machine room with every arbor true, every spindle capable of maximum speed without overheating, every saw free from blisters with each tooth gummed, swaged and filed to perfect alignment, every bit and knife properly tempered and sharpened, all machines set on solid foundations adjusted to reduce surface vibration to the minimum, the whole operated by a power plant capable of carrying the peak load without slacking and preferably operated by unit motors, taking their power from electricity generated by burning the mill refuse.

A well lighted bench department and glue room with core building and panel equipment, sash and door department with hand labor method whereby finished material would be handled without marring, the whole controlled by cost keeping methods that would insure a fairly correct knowledge to govern estimating and last but not least, the maintenance of delivery at the time promised.

A careful analysis of this brief summary illustrates the fact, that the operator of a real planing mill in order to be successful, must be a combination of business man, mechanic and artist and being

such, he is entitled to whatever profit there may be in the business.

Review of Current Trade Conditions

Ontario

Although there is not a large volume of business in progress to-day as compared with previous years, wholesalers and manufacturers report that a fairly steady volume of orders is coming in. None of the yards seem to be buying at all extensively. Business to-day is of an assorting nature, no orders being placed for future deliveries or for stocking up purposes. Apparently none of the retailers are at all worried about being short of stock early in the new year. They seem to have made up their minds to let that feature of the case take care of itself. If prices go higher they will undoubtedly let the consumer pay for what he wants, rather than seek to protect him by laying in stocks in advance.

The better grades of Canadian lumber particularly in the cutting-up lines for sash and doors have very little sale. This is due to a large extent to the fact that the sash and door manufacturers have been converted to the use of California and Oregon pine. Prominent wholesalers report that this is the result of the way in which Canadian grades have been put up for this class of trade as compared with the very satisfactory grading of the imported stocks. They assert that the Canadian manufacturers of these stocks would have been able to hold this trade, if, two years ago, they had introduced some rules of grading and inspection which would be satisfactory to the sash and door manufacturers. To-day, not only does this situation apply to cutting up grades, but shows signs of extending to the common and dressing grades of pine, particularly in 8 in., 10 in. and 12 in., as some of the dealers are beginning to feel that they can buy a very satisfactory grade in the imported stock at the same price as the Canadian stock.

There seems to be a fair amount of hemlock available at the present time, owing to the falling off in the building trade. Dealers are not buying extensively except in certain sizes in which they may be low.

B. C. shingles are showing a tendency to advance slightly, owing to the fact that the duty of 50c a thousand has been taken off. Dealers in Ontario will possibly find in another season that B. C. shingles are enjoying a much wider market in the United States and that they will find it difficult to secure stocks. One prominent wholesaler states that he expects dealers will soon be begging for shingles just as they were some three years ago when the price advanced to \$3.85 per thousand wholesale. The United States markets take an 18 in. shingle and the manufacturers prefer to make an 18 in. shingle rather than the 16 in. for the Ontario market.

Lath are pretty scarce and there are no signs of a surplus. The demand is still quite good.

Most of the wholesalers in Ontario are discussing the yellow pine situation quite keenly and expressing the opinion that retailers are making a mistake in throwing over Canadian pine so completely, as the time is likely to come in the near future when yellow pine prices will advance from \$3 to \$4 per thousand feet and they will then have to go back to Canadian stocks and consumers will be much less pleased with them.

Eastern Canada

A fair volume of business is being done in Montreal, but compared with the very active business of last year, trade is in reality dull. Prices are maintained however, particularly for the lower grades. No one seems at all disposed to express an opinion regarding the immediate future of the trade and, as to foretelling the conditions next spring, no one will say anything more than that they are hoping for renewed activity. Since the removal of the duty upon lumber entering the United States, exports of stock which had been held until the passing of the Tariff Act, have been quite extensive. An increase is also reported in the quantity of stocks being exported to Great Britain. Shipping space has been more plentiful and large quantities are being rushed across the Atlantic.

An improvement is noted in the market for eastern spruce at New York. A better movement is under way than was the case a month ago. Mills seem to have ample stocks however, and no price increases of importance are reported. Yard stocks are low and there is every prospect of an active business in spruce during the winter. At Boston, the trade in spruce has been less active during the past fortnight. Spruce frames and dimension are selling as a rule at \$24, although holders are trying to secure \$24.50. Since the removal of the duty, random has shown a tendency towards weakening. Boards are quiet

and are bringing about \$23. Boards planed on one side are bringing \$24 and matched boards \$25.

The demand for hardwoods at New York is broadening and a better average of prices is reported. Yards are short of stock in most cases and need their orders filled immediately. At Boston the prices for hardwood are steady, but no stronger, and the market is rather slow. A better run of business in hemlock is reported from New York suburban yards. Retailers continue to carry low stocks and to do a fairly good business, buying being strictly for immediate requirements only. The hemlock market at Boston continues slow. Some manufacturers are still asking \$23.50 to \$24 for eastern clipped boards. Dealers however, report that they can easily obtain stocks at \$23. Eastern random is uncertain and the range of prices is wide.

The shingle market at Boston is weak and unsettled. Some of the large Canadian manufacturers have reduced their prices for extras to \$3.75 and clears to \$3.50. Dealers are of the opinion that prices will go lower still as they have been offered good brands at 10c less. Red cedars are quoted as low as \$3.50 for extra clears. The lath market is easier for 1½ in., but 1⅝ in. remain unchanged.

Great Britain

The Board of Trade reports for September have been variously interpreted by financial experts in Great Britain. It is possible to take a pessimistic point of view in connection with these reports. On the other hand it is quite possible to extract a small amount of comfort from them. A number of important journals dwell extensively upon the fact that exports showed a falling off of about £800,000. On the other hand, it is important to note that imports increased by £4,180,485. The Timber Trades Journal referring to this says:—"We think that more allowance should be made for the indirect influence of the various strikes and consider that the expansion of £1,483,000 in the import of raw material alone during the month of September is something to set against the—let us hope—temporary slackening in the export of our manufactures." A falling off is shown in imports of hewn wood during the month, to the extent of 33,800 loads. A decrease is also shown of 3,798 loads of sawn. On the other hand imports of pit props during the month showed an increase of 140,846 loads.

The f.o.b. business is as quiet as ever. Consumption has fallen off in several districts and importers are not showing much inclination to purchase further stocks. No one claims that business is really bad, but that the volume is restricted. Spot prices continue firm. The few f.o.b. contracts reported are being made really to complete former purchases. Shippers are showing no unusual inclination to clear out the remainder of their stocks by lowering prices.

Latest reports from London tell of very quiet business, with an uncertain outlook for the immediate future. Buyers are holding off. Deliveries at London docks for the week ending October 4th amounted to 5,053 loads, as compared with 10,659 loads during the corresponding week of 1912. At Churchill & Sim's recent auction sale a lot of dry second, 3 x 7 in., 12/17 feet Quebec spruce was sold at £9 15s. A lot of second, third and fourth Quebec spruce 3 x 6 and 9 in., 11/13 feet brought £10. Some third Quebec spruce 3 x 11 in., 10/13 feet was sold at £11. A lot of dry second pine, 3 x 11 in., 8/13 feet, from Montreal was sold at £24. Dry first, 1 x 4 and 6 in., 6/11 feet pine from Montreal brought £18.

Trade conditions at Liverpool have been disturbed recently by the strike at Bolton, which it was feared might lead to widespread trouble in the cotton industries. Spruce deal c.i.f. transactions are now practically confined to liner parcels and recent figures will not encourage shippers to send forward much stock. This is a fortunate condition because any large arrivals of goods might cause a fall in prices. Referring to this situation, the London Timber Trades Journal says:—"Recent parcels have not realized values anticipated and in saying this we do not refer altogether to the somewhat indifferent parcels lately landed; but there have been several parcels of good deals sold below what one might call market value. The parcels already to hand will not seriously affect the position, but if these are likely to continue with any degree of steadiness the consequences will be serious. There is no doubt that the present demand is very far from satisfactory, and when the quays become cleared it will be seen that yarded stocks will be heavier than they have been for some years. At present, spot values have not been seriously affected." In the birch c.i.f. market, trade is very quiet and values are firm. No large quantities are expected. The spot market continues steady and consumption is improving. The market for Canadian pine deals shows no alteration

in prices. At Manchester, prices are a shade weaker, especially in spruce and pitch pine.

United States

Interesting opinions are already commencing to come out as to the effect of the removal of the duty on lumber entering the United States. The American Lumberman in its latest issue remarks that general trade continues of a hand-to-mouth order, but "the volume of business is steady and of such proportions as to make one believe that the manufacturer is not going to shut up shop because of the reduction in the tariff, but that he will readjust himself to conditions, for, that the American manufacturer is going to surrender his present share in the world's market without a struggle is hard to believe." Business is remarkable for the fact that everybody is exercising the closest possible scrutiny in purchases. Care is being taken everywhere to avoid overstocking. There is a fairly extensive movement of stocks in the large cities, to meet the requirements of building operations, but everyone agrees that fall trade is less than normal. Prices are irregular and the softness which has prevailed during the past three months shows signs of continuing.

A fortunate situation in some respects is that no serious car shortage has yet occurred to interfere with prompt shipments. It even looks doubtful now whether the volume of the freight movement will be large enough to cause any serious blockade. The important feature

of the northern pine market is the fact that the demand for low grade lumber continues quite active. Three, four and five boards are moving steadily at firm prices and stocks are not excessive. A normal volume of business is in progress among the box factories and dressed lumber plants in the Saginaw Valley. Upper grades are not moving so well, as orders for shop are better and few and far between. Minnesota retailers are carrying as small stocks as possible.

The demand for northern pine in the east is quite encouraging. Orders being received however, are all of a mixed character. Some prices are reported a shade easier, but in most cases they are firmly held. Buffalo lumbermen report that the tariff changes are not likely to affect their trade situation, as they expect the Canadian dealer to raise his prices to about the same level as those in the United States. Conditions have not changed materially in the Tonawandas. A moderate trade is in progress at Pittsburgh with prices fairly steady.

The hardwood markets indicate that buyers are making purchases only as they need stocks. No rush movement is reported. The demand for high grade oak, both plain and quartered, is quiet and prices are reported to be easing off to some extent, especially for plain white oak. In the northern hardwoods, birch and maple are in the lead. There is a good demand for rock elm and soft elm, neither of which are in oversupply. Hardwoods in general are doing better than soft woods.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Montreal Trade Continues Quiet

Montreal, October 24th; (Special to the Canada Lumberman):—Although a fair business is being done here and there, inquiries show that on the whole the lumber trade is slow. So far as wholesalers are concerned, it does not compare favorably with this time last year. Naturally, this is a rather quiet period, but many wholesalers say that it is not nearly up to the mark of 1912. Prices are still maintained, especially for the poorer grades of lumber.

If the financial situation should improve there is certain to be a heavy business next year. Many extensive building projects, for which plans have been drawn, are awaiting a more favorable monetary outlook. During the past season it has been difficult to obtain the requisite financial backing, and the lumber trade has suffered in common with the other sections dependent, to a large extent, upon building operations.

Firms exporting lumber to the United States report that, consequent upon the passing of the new tariff law, considerable lumber is being shipped over the border.

Exports are still being rushed to Great Britain and the continent. There has been an improvement in the quantity of shipping room available for lumber.

The ground wood market is very strong. The mills are shipping at a rapid rate, the price being \$18 at the mill, an advance of two to three dollars on recent prices.

Sulphites are quiet, although there are no large stocks on hand. With the advent of cold weather, which is always a busy time in chemical fibres, there is likely to be an improvement in market conditions, as European makers are demanding high prices for the product.

Canadian mills are all well sold up for news print. Notwithstanding the heavy increase in production, fair prices are being obtained, and there is no likelihood of any such quantity going on to the market as to affect quotations materially.

Ottawa Trade Active—Bushmen Plentiful

Ottawa, October 20th (Special to the Canada Lumberman): Though the revised United States tariff has been in effect about two weeks local lumbermen and manufacturers of forest products, such as paper pulp, etc., feel that it is yet too early to say exactly what the effect is going to be here. They admit, however, that since the change, purchases of lumber, principally medium grades, made some time ago, have been shipped to the United States. Several United States buyers, too, it is said, have been here "scouting around" to use the expression of one prominent lumberman, looking for an opportunity to buy what they want of this season's cut.

A canvass made of the leading members of the trade here elicited the information that the new tariff bill is regarded favorably, but it is generally admitted that it will be some time before prices will be affected. If the demand for medium grades and mill culls from the

United States is as great during the next few months as expected, there is likely to be a rather substantial jump in the prices. In the past two weeks 1¼ x 7 in. to 16 in. mill run spruce has gone up an even \$2 and a similar advance in hemlock and tamarac log run has been registered. On the other hand three of the grades in pine strips and pine shorts have declined \$2.

Trade locally is considered to be very good for so late in the year. Building in the city and district is particularly active and the permits for this month promise to break all previous records. The outlook for better things locally is bright. The Ottawa Electric Railway have just opened two extensions to their system, with the result that what was formally virgin land is now being opened up for building. Most of this property is within fifteen minutes ride of the center of the city and in what is considered the best residential section of the city.

All the mills in the city are working full time and will be until the severe weather sets in. This season's cut promises to be considerably larger than last.

Another costly lumber fire visited the mill and lumber piles of the Greater Ottawa Lumber Company last week and completely destroyed the whole of the plant and stock of the company, entailing a loss of \$60,000, nearly all of which is covered by insurance. This fire was caused, it is thought, by overheated machinery. Soon after the outbreak the flames spread through the mill with such rapidity that some of the employees, who were at work at the time, had narrow escapes with their lives. At one time it was thought some of them had perished. The mill was a two-storey frame structure valued at \$30,000 and the stock at the same amount. It was opened about two years ago. The members of the company are E. P. Magrath, P. J. Dawson, T. J. McGowan. Rebuilding will commence forthwith.

Provinces Win Companies Case

Judgment in the Companies Case, which is of great interest to lumbermen in general, was handed down last week by the Supreme Court of Canada, but as the verdict favors the companies, or the provinces, the defendants in the case, the Dominion Government, it is understood will appeal to the Privy Council in England. The case hinged on the respective powers of the different provinces, as opposed to the Dominion government, to incorporate companies. The argument of the provinces was that a company registered under a provincial charter had the right to do business in another province, under a charter from that province, without taking out a charter from the Dominion government. The E. B. Eddy Company, of Hull, which has its plant in Hull, Que., yet does business throughout Canada, was cited as an illustration. Had the judgment of the Supreme Court favored the Dominion government it would have meant the suspension of several companies and caused a general disruption of business besides affecting millions of dollars invested in companies operating under a provincial charter.

Bushmen Plentiful This Year

The number of men offering themselves for employment in the

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

OF DRY SPRUCE IN CANADA**

bush is greatly in excess of the demand, showing that the depression in the money market, which has been prevalent for several months, is having a serious effect on the labor market. One of the results of the plentiful supply of men has been to cut down the wages paid to bushmen. Men who were paid \$35 per month with board last year are only being offered \$30 this year, and men who received \$30 are now receiving \$26 to \$28. The recent regulations put into effect by the Dominion government compelling all employment agents to register as such and submit their records for government inspection in addition to being liable to punishment should they exact more than \$1 for obtaining employment for an immigrant has caused agents in Ottawa to refuse to have anything to do with immigrants whether British or not.

Six houses with all their contents, the former belonging to the Estate James Davidson Lumber Company, were completely destroyed by fire at Davidson, Que., a few days ago. Fortunately the occupants of the houses were all out at the time. The cause of the fire is unknown. Not only the men employed at the mills, but farmers in the district assisted in preventing the fire from spreading to adjoining property.

The James MacLaren Lumber Company, of Buckingham, Que., sued the estate of the late Charles Logue in the Hull Superior Court a few days ago for \$4,700 damages claimed for valuable timber cut from the company's limits in Hinck and Blake townships. Judgment was reserved.

Miss Ange Girouard, of Hull, sued the E. B. Eddy Company, of Hull, in the Hull Superior Court last week for \$5,000 damages, under the Workmen's Compensation Act arising out of an accident by which the girl lost her right hand when working in one of the mills of the company.

Chairman H. L. Drayton, of the Railway Commission, has returned from his mission to England where he went to confer with the British Government concerning the joint control of freight rates. Though his report has not been made public, nor any inkling of it given openly by him, it is forecasted that his mission was not very successful. To the correspondent of the Canada Lumberman he intimated that his report would contain some useful information that might have a significant bearing on the question of the regulation of ocean freight rates.

The cartage question that has been on the tapis between shippers throughout Eastern Canada, and the railways, has been settled for a time, if not permanently. Shippers are now paying three cents per hundred pounds instead of 2½ cents for the delivery of their goods in the cities. The railways threatened to withdraw their support from the cartage companies if they could not raise their rates half a cent per 100 pounds. The shippers at first objected and then gave way. A tentative agreement has been made between the railways and the shippers' representatives from October 1st to January 1st, but it is understood that it will be made permanent after the first of next year.

New Brunswick Trade Conditions—English Deals Easier

St. John, N.B., Oct. 20; (Special to the Canada Lumberman).—The past two weeks have seen comparatively little change in the lumber industry here. All the mills have resumed operations and will, no doubt continue to saw well up to winter. In the local market only a fair demand for lumber is experienced. The yards are fairly well stocked. The buildings now under erection are well along and very little new work is being started, which is only natural, as the cold weather is approaching when work is always curtailed more or less. This year is no exception, so the mills and yards do not look for any heavy demand locally this fall.

English Deals Easier

Prices for English deals have receded about \$1 per M. since the last of September, and today, not over \$16 can be had for the ordinary specification of English, with the scantlings and excess of narrows at the usual reduction. The buyers here do not hold out any great encouragement that prices will be higher on this market later on. Stocks are very heavy on the west coast, between 50 and 60 millions of spruce deals being on hand at Manchester and Liverpool on October 1st. If there should be any business at all, there is no reason to believe but that prices will rise somewhat, as all stocks of deals have been shipped from the north shore of the province and from Nova Scotia. St. John has nothing sawn and what it will saw from this time until the close of navigation will be light, therefore, if business should increase at all a scarcity of deals from this side should advance the market. Of course, it all depends on conditions in England, and they are not at their brightest, nor do they show anything to warrant an improvement in the near future.

American Markets Quiet

Practically no shipments are being made from here to the American market, as it is impossible to sell any stock that will net a profit to the seller, there being practically no demand. This is caused largely by the tight money market, the large yards even finding it

hard to finance their bills and many of them worth from one hundred to two hundred thousand dollars, are unable to meet their obligations promptly. How long this condition will continue is a problem no man seems able to solve. Practically no prices can be set for the New England and New York markets. It is a question of finding buyers. The sellers are asking, for schedules, delivered New England points, a base price of \$24.50 per M. running 2 x 8 and under, 20 ft. under, with 2 x 3 and 2 x 4 at \$21.50 and heavy and wide stocks, largely 2 x 10, \$25.50.

Lath sellers are asking from \$3.80 to \$4 at New York, but no large quantities are going forward, so it is felt that the lath market is very apt to "stiffen" before long. Very few laths are available at St. John, as mills have only been in operation a short time.

Low Grade Shingles Scarce

In the low grades, shingles such as 2nd clears, extra No. 1 and scoots, there is a great shortage all over the province, but for extras and clears there is a very heavy stock on hand all over the province, with very little demand, there being some fifty million of each in stock. Possibly this will make a much lighter cut of cedar logs during the winter than occurred last year, as shingles moved very much faster in 1912 and at much better prices than in 1913.

During the last two weeks a general downpour of rain has occurred all over the province, which will make the woods very wet for fall yarding, when everything a month ago pointed to a good dry season for yarding.

Tonawanda Trade Very Quiet

North Tonawanda, October 20th (Special to the Canada Lumberman): There is little change from the lethargic conditions that have marked the local lumber trade during the last two weeks. Business is about as near complete stagnation, so far as new business is concerned, as it has ever been in the history of the local market.

An unusual sight for the Tonawandas where there is plenty of lumber, but little timber, is a million and a half feet of white pine timber that is piled in the yard of the Haines Lumber Company on Tonawanda Island. The timbers range in length from 12 to 16 feet. They were brought from Michigan where the owners have extensive white pine holdings.

Receipts of lumber at the Tonawandas were brisk last week in spite of the fact that sales were slow. Twenty boats arrived during the last eight days with cargoes of from 600,000 to 1,200,000 feet. The close of navigation is now in sight and there will be a rush to get all the lumber possible down the lakes before insurance expires. Lumber cargoes are plentiful as indicated by the rate of \$3.25 per thousand feet paid on a boat load of hemlock that arrived last week.

Those who feared that Canadian lumber would be rushed to the local market as soon as the tariff was removed are still looking. One cargo of lumber that was held at East Saginaw a few days to escape the duty has arrived at the Tonawandas so far, the sole representative of cargoes that were said to be held back pending the passage of the new tariff law. The owners of the lumber escaped a tariff tax of \$600 on the cargo. The lumber was quickly swallowed up in one of the big local yards. This stock was of the cheaper grade, the better grades of Canadian lumber being few and far between after Canadian dealers take their pick of the market on the other side of the border. Canadian lumber is still as much in demand on this side of the border, but there isn't enough of it.

Busy Month for North Shore

Thessalon, October 25th; (Special to the Canada Lumberman):—October was a banner month for lumber shipments on the north shore. Shipments during the month of September were very light, owing to the then approaching change in the United States tariff. Now that lumber has been put upon the free list many available boats are in commission and are moving stocks away from north shore yards, which up to that time had been pretty well filled. Stocks along the north shore are pretty well sold and in most cases the purchaser is obtaining the benefit of the duty, \$1.25 per thousand feet. About 50,000,000 feet were shipped from the north shore during October, the largest shipper being the Thessalon Lumber Company.

Woods work is progressing favorably and the camps are all well filled. Men are much more easier to secure than in former seasons and although supplies are more expensive, horses are somewhat cheaper. Weather conditions have been quite favorable up to date and operators expect that skidding and road cutting will be done at much less cost than last year. If a favorable winter follows, the cost of logging should be quite reasonable.

Mr. H. H. Bishop, general manager of the Thessalon Lumber Company, returned recently from a business trip to Chicago. He reports that trade in Chicago is good and that a large amount of building is under way, so that most of the yards are doing extensive buying.

Upper St. John Cut will be Ninety One Million

Van Buren, Me., October 18:—Estimates which have recently been prepared indicate that the entire lumber cut on the upper St. John River, both the Maine and New Brunswick sides, for the winter of 1913-14, will be about 91,000,000 feet, of which 20,000,000 will go to St. John and 65,000,000 to Van Buren mills. A. E. Hammond will handle about 13,000,000 feet by rail. Hammond and Sirosis will cut about 5,000,000 feet which will go to Van Buren over the Bangor and Aroostook Railway. F. W. Collins & Son will cut 8,000,000 feet for Mr. Hammond in Northern New Brunswick which will go to Van Buren.

The estimates of the total cut for this section on both sides of the St. John River which have been secured from an authoritative source are given as follows:—

John A. Morrison for the St. John Lumber Company of Van Buren, on the Baker branch, 12,000,000 feet.

W. J. Noble, for Stetson, Cutler & Co., of St. John, on the main St. John River above Seven Islands, 6,000,000.

Albert Currier for Stetson, Cutler & Co., of St. John, on the main St. John River above Seven Islands, 5,000,000.

Flavien Chouinard for the St. John Lumber Company of Van Buren, on the Baker branch, 5,000,000; on the Big Black, 7,000,000.

Robert J. Potts for the St. John Lumber Company of Van Buren, on the Allagash branch, 5,000,000.

Joseph M. Michaud for the St. John Lumber Company of Van Buren, on the Allagash, 5,000,000.

Charles E. Jones for the St. John Lumber Company of Van Buren, on the Little Black, 3,000,000.

W. H. Cunliffe Sons for the Stetson, Cutler Company of St. John, on the Allagash, 6,000,000.

St. John Lumber Company of Van Buren for themselves, on the Little Black, 6,000,000.

John E. Dickey for Randolph & Baker of St. John, on the Little Black, 3,000,000.

John Kilburn for Murray & Gregory of St. John, on the Northwest branch, 6,000,000.

England Lumber Company for the Van Buren Lumber Company of Van Buren, on their Iroquois and the Madawaska, 9,000,000.

Hammond & Sirosis for A. E. Hammond of Van Buren, on T. 17 R. S., to be hauled by rail over B. & A., 5,000,000.

S. W. Collins & Son for A. E. Hammond of Van Buren, on the line of the International Railway, to be hauled by rail, 8,000,000.

Glasgow Quarterly Timber Trade Report

Edmiston & Mitchells, Glasgow, in their Quarterly Timber Circular, under date of September 30th report as follows:—The timber trade in this district during the past quarter has continued in a more or less dull condition, with the demand at no time attaining anything more than mediocre proportions, and but for the fact that the shipbuilding industry has called for fair supplies of wood-goods, the results obtained would have been much more disappointing. As it is, the movement into consumption shows a considerable decrease in comparison with last year.

There have been signs in different directions that the trade boom experienced during the last few years is now on the wane, and that a spell of quieter trade is in prospect. Some of the allied industries are already complaining of scarcity of new work, which is naturally being reflected in the demands from these sources. Wagon-builders and cabinet-makers both come under this category, and shipbuilders who are still well employed with old contracts, are also finding new work anything but plentiful. There is therefore less forward buying in evidence, the tendency being to keep stocks as low as possible, particularly as it is felt that values have reached top level.

Turning to the statistical position, the imports for the nine months are about fifteen per cent. less than for the corresponding period last year, while the consumption also shows a regrettable shrinkage of about twenty per cent. With regard to the stocks remaining at this date, it may be said that while they are by no means unduly heavy, they are of a fairly ample nature in view of the unsatisfactory conditions ruling.

Values for the most part have kept reasonably steady, a fact which in some measure is due to the moderation of imports, as had these reached at all heavy proportions, it is undoubted that values would have met with a set-back. As it is, there are few alterations of any importance to report.

The Clyde shipbuilding returns show that the output for the nine months to 193 vessels of 488,180 tons, as compared with 197 vessels of 472,273 tons in the corresponding period last year, and 180 vessels of 433,218 tons for the first nine months of 1911. There is now every prospect of last year's record output being exceeded.

Imports From British North America

Pine logs.—The import for the nine month's to date amount to only 276 loads as compared with 2,740 loads for the corresponding

period last year. The consumption for the nine months is merely 210 loads, and the stock now stands at 3,073 loads. These is an entire absence of demand, and no sales of any importance have transpired this year. Values are only nominal.

Oak logs.—The import over the nine months amounted to 963 loads, and consisted for the most part of deliveries against contracts. A moderate enquiry has existed for timber of good average dimensions, and a few sales of such were reported at firm values.

Elm logs.—Arrivals to date total 1,135 loads. A moderately steady demand has continued in evidence, particularly for timber suitable for shipbuilding purposes, and values are fully maintained. The stock on hand of 1,503 loads is by no means excessive.

Birch.—Logs.—There have been very heavy arrivals of round logs which were, however, almost entirely in fulfilment of contract, and a good proportion of which are included in the stock shown on hand at this date. Consignment timber has met with only moderate request, and values were barely maintained. Lumber.—An active demand has existed for planks at full prices, and any consignment shipments which came to hand were readily disposed of on arrival.

Pine deals and sidings.—Imports this season have been on quite a moderate scale, but, nevertheless, have proved more than adequate to overtake the requirements of the market. The little demand in evidence was confined chiefly to the lower grades as regards both deals and sidings, any movement which occurred in first quality being quite infinitesimal. Values have undergone little alteration.

Spruce deals, etc.—The business in Spruce has been of a disappointing nature, a fact which is very largely due to the increasing competition from the Baltic. There was a moderate import of Quebec and Lower Port deals, but difficulty was experienced in securing shipper's ideas of values.

Liverpool and Manchester Trade Statistics

The import, consumption and stock of spruce, pine and birch at Liverpool and Manchester on October 1st, are reported by H. W. Lightburne and Company, Liverpool, as follows:—

Spruce and Birch

Month Ending September 30th, 1913

Pine Timber Demand Still Quiet at Liverpool

Farnworth & Jardine, Liverpool, under date of October 1st report as follows:—The business of the past month was much interrupted through labour troubles. Imports in the aggregate were on a par with corresponding month last year, but owing to the difficulty in handing them, through traffic disorganisation, the deliveries were very much restricted, being fully 28 per cent. below September of last year. Stocks have accordingly increased, and of some of the leading articles are now too heavy, but values generally have been fairly maintained. Ocean deal freights are lower, partly owing to the absence of demand in this direction.

Canadian woods.—Pine timber.—Imports have again been quite moderate; there is no improvement in the demand to report, but

values rule high. Wane pine, 1st class: About 500 loads of large average wood have been imported to Manchester on contract; the demand continues quiet, and the deliveries small, but values show little change; stocks are sufficient. 2nd class is only in limited request; stocks, though not heavy, appear adequate. Square pine.—No arrivals; the demand is very slow. Red pine.—Practically no demand; the stock is light. Oak.—The arrivals of about 33,000 feet to Manchester, largely on contract, will probably go direct into consumption; deliveries small, but stocks are moderate, and values steady. Elm.—The import of 9,000 feet to Manchester was chiefly contract wood; deliveries show improvement; values are very firm, and stocks moderate. Pine deals.—The arrivals in quantity about similar to the previous month, but deliveries were restricted owing to transport difficulties, and stocks have increased; the demand is rather quiet, but values are firm.

New Brunswick and Nova Scotia spruce and pine deals.—The imports to the Mersey (including Manchester) during the past month amounted to 8,710 stds., against 7,680 stds. for the corresponding month last year; the consumption, taking into account the great difficulties in obtaining delivery, owing to labour strikes, may be considered satisfactory; still, stocks have increased, and are now too heavy. There is little change in cargoes value to report, but in liner shipments lower prices were accepted during the strikes. Pine deals are in fair request at steady prices.

Birch.—Logs.—There have been no arrivals; deliveries have been small, but stocks are light and values firm. Planks.—With small import and deliveries fairly satisfactory, stocks are now reduced to moderate compass; values are firm.

British Columbia and Oregon Pine.—The arrivals have been by the liners, viz., about 25,000 cubic feet, logs and lumber; only a limited enquiry, and stocks are ample; values are steady.

Glasgow Markets for Mahogany, etc.

Cant & Kemp's, 52 Saint Enoch Square, Glasgow, under date of October 3, report as follows:—Mahogany.—The stock is moderate and is chiefly in importers' hands. Prices are firm. Walnut logs and lumber.—The stock of logs is light as well as the stock of lumber. There is only a moderate demand which is chiefly for parcels of prime grade and wide average. Small and inferior timber is difficult to sell. Quotations are:—logs, 3/6 to 6/6 per c.ft.; lumber, prime grade, 5/- to 7/-; medium grade, 3/3 to 4/-; culls, 2/- to 2/6,—all per cubic foot, according to specification. U. S. oak logs, etc.—The stock of logs is moderate and the enquiry limited. Quotations are:—2/6 to 4/3 per c.ft., according to quality and specification. The stock of quartered and plain oak boards is ample for the demand. Quotations are:—quartered oak boards, prime grade, 4/6 to 5/6; Second grade, 2/9 to 3/3; plain oak boards, prime grade, 3/- to 4/-; medium grade, 2/3 to 2/6; culls 1/6 to 1/9 all per cubic foot according to specification. Wagon oak planks.—The stock is considerably heavier than at this time last year, and more than sufficient for the demand, which has been exceedingly slow for some months past. Consignment parcels are difficult to sell. Quotations are for first class parcels, 2/3 to 2/8; and for second class, 1/9 to 2/1 all per cubic foot. Austrian wainscot oak.—The stock is light, and parcels arriving are chiefly on contract. Prices are very firm. Quebec oak.—The stock is moderate, with a fair enquiry for first class parcels suitable for railway work. Prices are steady. Ash.—The stock is light, and the demand is good, particularly for first class parcels of logs. Prices are very firm, and unless some change takes place in the freight market, are likely to continue so. Birch.—The stock of logs is heavy, and largely in consumer's hands. The stock of planks and boards is moderate with a fair enquiry. Quotations are:—logs, 1/9 to 2/6. Planks and boards, 1/6 to 1/10 all per cubic foot according to quality and specification.

Prairie Province Trade Improving

Winnipeg reports indicate that wholesale and retail lumber merchants of that city have been experiencing an improvement in business since October 1st. Many reports were to the effect that October would compare favorably with October of 1912, from a business point of view. Good grain crops in the three prairie provinces, and the rapidity with which it is being marketed have been important factors in the stimulation of business. The building outlook for next season is encouraging, as a great deal of work that was postponed this year on account of the scarcity of money will be carried out. Mills in the prairie provinces and in the Rainy River district will probably enlarge their winter operations this year. Lumber prices are steady and an improvement is reported in collections. Payments in the country generally are expected to improve considerably towards the end of the year. Throughout Alberta the demand for lumber has been steadily increasing since the completion of fall farming operations.

The railroads of the United States use about 150,000,000 wooden ties each year.

Timms, Phillips & Co. of Vancouver, B.C.

Readers of the Canada Lumberman will have noted the quarter-page advertisement carried for the above company for some months past, and we are pleased to say that we have the company's authority for the statement that their shipments to eastern points have shown a steady and gratifying increase in volume following the initial orders sent forward. The firm specialize in fir, spruce and cedar lumber, and red cedar shingles, their output in these lines being of a very high quality, and prompt filling of orders is a cardinal principle of their business. A short sketch of the men at the head of the company will no doubt prove interesting.

H. Timms, president, is well and favorably known to the trade in Western Canada, and to many of the Eastern dealers as well, owing to his eight years' connection with the industry in Vancouver, most of which was spent in the service of the Imperial Timber & Trading Company, Limited, as manager. In that position his energy, business aggressiveness and knowledge of market conditions became marked qualities, which won for him a prominent place among the lumbermen of the province. In January last Mr. Timms decided to engage in business on his own account, the firm of Timms, Phillips & Company, Limited, being then formed.

T. N. Phillips, vice-president and partner, also enjoys a wide acquaintance with the lumber buyers of the West, having been manager of the Burley Lumber Company, Limited, Vancouver, for several

Herbert Timms, President of Timms, Phillips & Co., Vancouver.

T. N. Phillips, Vice-Pres. of Timms, Phillips & Co., Vancouver.

years, and previous to coming West had been connected with the Rat Portage Lumber Company at Kenora, Ont., his birthplace. While learning the lumber business Mr. Phillips became a hockey player whose brilliant work in forward position made him a tower of strength and caused the leading teams in the east to seek the aid of his effective stick. In 1903, while attending McGill College, he played with the Montreal seven, champions of the world; in 1904 with the Toronto Marlboroughs, winners of the O.H.A. championship; in 1905-7 he was captain of the famous Kenora Thistles, winners of the Stanley Cup in a famous match played with the Wanderers of Montreal; and the season of 1908 he spent with the Ottawa team. After going west Mr. Phillips did not lose touch with his favorite sport, lending his valuable aid to the formation of the Coast league and playing with the Vancouver team during the season of 1911.

Mr. Phillips left Vancouver on November 1st for prairie and eastern points, and will be absent about four months. Combining business with pleasure, he will call on the trade wherever he visits, his firm having planned to take full advantage of the great demand for lumber that is predicted for next year.

A report from the Saskatoon Board of Trade says that the enormous amount of grain which splendid weather conditions have enabled the farmers to thresh and ship, is beginning to tax the rolling stock of the railways in a manner likely to become serious in the near future. So far little or no shortage has been experienced; and the transportation companies deserve great credit for remarkably expeditious handling; but, it is impossible for them to provide cars for anything like the wheat which will be ready for shipment in the near future, and considerable congestion may be anticipated. Naturally, most of the farmers are anxious to ship at the earliest moment, as November 1st is their settling day, and as all the elevators are filled, the shipment of the grain is the only method of turning it into money. The completion in December, 1914, of the great Dominion Government Interior Elevator at Saskatoon, will largely solve the car shortage difficulty.

A Short-cut Method of Cruising

By C. S. Judd

There was recently brought to my attention a short-cut method of cruising timber or what might be called an easy method of check-cruising which has frequently been used by a prominent timberman on the Columbia River in the State of Washington.

When purchasing stumpage on the basis of an estimate this timberman has made use of this method on occasions when he has desired a better check-cruise than merely his own ocular estimate and has desired to base the results of his field work on some tangible figures.

The timber that he purchases is usually of good quality, uniform in character, and as a rule is found on accessible valley bottoms which are readily reached by wagon roads. He drives along the road carefully scrutinizing the timber until he comes to a spot where it appears to be of average density and average size. Here he begins at any convenient tree picked out at random and estimates and records its diameter outside the bark at breast height. He then looks in all directions and mechanically selecting the nearest tree, irrespective of what direction it is found in relation to the first tree, paces the distance and the diameter of the second tree.

The process of selecting the next nearest tree and recording its diameter and its distance from the tree just measured is repeated until the diameters of about twenty-five trees have been recorded. Each time the nearest tree is mechanically selected, unless, of course, it has already been measured. In other words, the measurement of the diameter of any particular tree and of the distance between it and a tree that has already been measured is never repeated.

The course that is taken in going from tree to tree has no reference to the points of the compass and may be described as a series of connected straight lines, each line varying greatly in direction according to the location of the trees.

The timberman then goes back to his vehicle and carefully noting as before the character of the timber as he drives along selects another spot where the size and occurrence of the timber appears to be typical. Here in the same manner he measures about a score more of trees. This is repeated as many times as his convenience will allow.

When he returns to his office the timberman has measurements of the diameter of a large number of trees and of the distance between them in the order in which the measurements were taken. The diameter of the average tree among which he has measured is then determined. Being of a scientific turn of mind, this timberman recognizes the axiom that the volumes of trees vary more nearly as the squares of their diameters than as their diameters. He determines the diameter of the average tree therefore in the customary manner by computing first the average basal area of all the trees and from this the corresponding diameter. The volume of the average tree is then computed either from a volume table or from a log rule, making allowances for height, taper, and thickness of bark.

The next step is to determine the average number of trees per acre. The distances between the measured trees are totalled and this total is divided by the number of measured distances. The result gives the average distance, measured in feet, that each tree is apart from its neighbor. This average distance is then squared to obtain the average area or ground space in square feet that each tree is allotted in the forest. This average area is then divided into 43,560, the number of square feet in an acre, to determine the average number of trees per acre.

The rest is simple. The volume of the average tree is multiplied by the average number of trees per acre and the result is the volume of timber in board feet on an average acre. The product of this average volume per acre and the acreage of the claim gives the total volume or cruise on the tract of land under consideration.

This method of course has many drawbacks which tend to give inaccurate results. An error in selecting an area where the density of the stand and the size of trees is not representative of the whole tract will result in an estimate either too high or too low. No data for the preparation of a map can be taken by this method and the estimate can not be separated by species. It should be used, however, only where there is a large percentage of one species such as Douglas fir in the stand and when the desired result is only one figure for either the average volume per acre or the total cruise of timber on a subdivision of land.

The advantages of this method are many. It is convenient, simple and rapid. In measuring distances no regard need be taken of the cardinal points, hence there is no orientation and no compass or other instrument is needed in the work. No time is consumed in looking up section corners or lines for a starting point or in measuring and laying off the boundaries of a sample plot.

It would be interesting to test the results obtained by this method with those secured by some of the standard methods of estimating timber used by the Forest Service.—Forestry Quarterly.

An Important B.C. Legal Question

An interesting point of law was brought up in the arbitration court in Vancouver recently before Judge McInnes. The widow and children of Gus Hill, a logging camp employee of the Victoria Lumber Company instituted the case under the Workmen's Compensation Act. The point at issue is whether or not a logging camp comes within the definitions of companies to which the Workmen's Compensation Act applies. So far as the facts are concerned Judge McInnes found for the plaintiff and reserved judgment upon the point of law. This matter is of the utmost importance to all logging camps and is one upon which no ruling has yet been made. Gus Hill was killed at Chemainus, last October by the fall of a tree and his widow claims the maximum amount, \$1,500, for the loss of her husband.

The act reads that the benefits are for those employed in engineering work, in manufacturing work, and all other works of construction and alteration where machinery is employed. A similar question has been up several times, but hitherto the cases have all been decided upon some less important issue. The nearest case, so far, was one in which an employee was killed during the clearing operations at Shaughnessy Heights. In that case Judge McInnes held that the clearing was an engineering operation, being part of a plan to fit the property to be a residential district. This decision was set aside later by Mr. Justice Morrison, but upon an appeal to the Court of Appeal the original decision was upheld. It is regarded as certain that, whichever way the decision goes, the matter will be taken to the Court of Appeal in order to provide a precedent.

A well-known British Columbia manufacturer of lumber, writing to the Canada Lumberman, states that general trade conditions have shown little alteration during the past two or three months. The opinion prevails that for the balance of the year business will be about the same as it is at present. From the first of the year manufacturers, however, are looking for a decided improvement and are counting upon good business by June, 1914. Other letters which the Canada Lumberman has received from British Columbia express almost identical opinions to those mentioned above.

Much of the piling, wharf material, and lock gates of the Panama canal are made of greenheart, said to be the most durable wood known for these purposes, which comes mainly from British Guiana.

The New U. S. Free List for Wood

Readers of the Canada Lumberman are already familiar with the main facts in connection with the removal of the duty upon lumber entering the United States. The actual clauses referring to wood under the free list are as follows:—

647. Wood: Logs, timber, round, unmanufactured, hewn, or sawed, sided or squared; pulp woods, kindling wood, firewood, hop poles, hoop poles, fence posts, handle bolts, shingle bolts, gun blocks for gunstocks rough hewn or sawed, or planed on one side; hubs for wheels, posts, heading bolts, stave bolts, last blocks, wagon blocks, oar blocks, heading blocks, and all like blocks or sticks, rough hewn, sawed, or bored; sawed boards, planks, deals, and other lumber, not further manufactured than sawed, planed, and tongued and grooved; clapboards, laths, pickets, palings, staves, shingles, ship timber, ship planking, broom handles, sawdust, and wood flour; all the foregoing not specially provided for in this section.

648. Woods: Cedar, including Spanish cedar, *lignumvitae*, lancewood, ebony, box, granadilla, mahogany, rosewood, satinwood, and all forms of cabinet woods, in the log, rough, or hewn only, and red cedar (*Juniperus virginiana*) timber, hewn, sided, squared, or round; sticks of partridge, hair wood, pimento, orange, myrtle, bamboo, rattan, reeds unmanufactured, India malacca joints, and other woods not specially provided for in this section, in the rough, or not further advanced than cut into lengths suitable for sticks for umbrellas, parasols, sunshades, whips, fishing rods, or walking canes.

Ottawa Lumbermen Pleased With New U.S. Tariff

Ottawa, October 23.—Ottawa lumbermen in general are well pleased with the alterations in the United States tariff which recently went into effect and removed a duty ranging from \$1.25 to \$2.25 per thousand feet on lumber going from Canada to the United States. The prevailing opinion in Ottawa is that the new tariff will not affect local prices for some time and no one seems to be able to predict what the result will be in the long run. The immediate affect will be to assist Ottawa lumbermen in moving large stocks held up there, which were bought by United States lumbermen some time ago and held at Ottawa pending the change in the tariff. Mr. P. C. Walker, general manager at Ottawa for Shepard & Morse said that he looked for no other important change at present.

Canadians Should Get the Benefit of Duty Removal

A Buffalo lumberman interested in a southern mill, in speaking of the alleged prospect of severe competition from Canadian lumber under the new tariff, says there is nothing to fear in that direction, and that he can advise mill proprietors that there is no cheap lumber in Canada that, for example, would work into the market to the detriment of North Carolina pine. He thinks it is unlikely that British Columbia shingles will compete to any great extent. These shingles are heavier and the freight and other costs of handling them will make up for any lowering of duty. White cedar shingles are likely to have greater entrance into the New England market. In the opinion of this lumberman, the new tariff law is a good thing and will stimulate, rather than retard, business.

Quebec Exports of Pulpwood During 1912

Gebhart Wilbrich, United States Consul at Quebec, in a recent report to the government at Washington, says: "The price of pulp wood consumed by Canada during 1912 decreased from \$6.45 to \$6.02 per cord, and though the statement has often been made that the price of pulp wood exported to the United States increased greatly in 1912, the records of this office furnish no evidence of that fact, as the invoice prices of wood sold during 1912 are substantially the same as in former years.

The restrictions placed on the exportation of pulp wood from this province in May, 1910, were removed from four limits in December, 1912, with the expectation, it seems, that such removal would enable the four paper-producing companies to export their products to the United States free of duty. As it was apparent, however, that those companies were not in the position to export wood, because they required it for their own use, and hence that no corresponding benefit was extended to American importers of wood, no freedom of duty was granted by the United States, thus leaving the partial abrogation of the Quebec restrictive policy without beneficial effect, either to American purchasers of wood or to Quebec exporters of pulp and paper. That the adherence to this policy of restriction on the part of Canadian provinces will not result either in materially reducing the quantity of pulp wood obtainable by American consumers, or in raising the prices of this wood, seems reasonably certain in light of the figures furnished and of the material still available for years to come.

There is little doubt that a considerable increase in the exports of

pulp wood and its products to the United States will continue from year to year, for wood and water power have just begun to be used to any great extent in manufactures in this province and are capable of indefinite expansion. One large pulp and paper mill in the north-western portion of this district with ample water power and large public limits, now turns out great quantities of pulp and paper, and ships all of its products to the United States. Another mill in the northern part of this district started to make paper in 1912, and will soon run to its full capacity. A third mill on the Saguenay River was greatly enlarged in 1912, and has now begun shipping paper as well as pulp. A fourth mill a few miles from this city has increased its output, and is preparing to increase its capacity still further. A fifth mill is now being built near Quebec, and will be ready to start by the end of this year. All of these mills have fine water power and great timber resources, which, given favorable market conditions, will boom the pulp and paper business greatly in the near future. In addition to this, the possibilities of future development of the large wood and power resources of the lower St. Lawrence and of the Island of Anticosti, at the mouth of the St. Lawrence, indicate the extent to which the pulp and paper industry of this province may develop in the next decade.

The increase in forest exports to the United States was, however, not confined to pulp wood, pulp, and news print, but extended to the various classes of lumber and timber, which in 1912 were \$1,259,372 against \$778,249 in 1911.

Personal News of Interest to Lumbermen

Mr. J. Stanley Cook, secretary of the Montreal Lumber Association, and assistant secretary of the Montreal Board of Trade, was married on October 14 to Miss Jeannette Diemer. The marriage took place in Cleveland, Ohio.

Members of the American Forestry Association throughout the United States and Canada are being advised that a forestry conference will be held on November 18, 19 and 20 in connection with the National Conservation Congress in Washington. At this Congress reports will be presented by ten sub-committees, upon the results of their investigations into forestry and lumbering problems.

R. W. Breadner, formerly tariff expert for the Canadian Manufacturers' Association, who was appointed last year chief appraiser for the Department of Customs at Ottawa, has been selected to act as chief adviser to Hon. W. T. White, Minister of Finance, in tariff matters. Mr. Breadner will advise the minister concerning any changes which may be proposed in existing customs tariff of Canada.

Mr. A. G. McIntyre, who was recently appointed to the position of chief of the government's department for the study of wood products, recently spent several weeks at Madison, Wis., studying the methods and organization of the forest products laboratory at that place. Mr. McIntyre will make an extensive report upon his observations at Madison, with a view to assisting the government in the establishing of the forest research laboratory at Montreal in connection with McGill University.

J. B. Fraser, president of the Fraser-Bryson Lumber Company, and well known among the lumbermen of this Province, has just had the painful experience of being lost while ranging in one of his company's wood limits. In company with his cousin, Robert Chamberlain of Detroit, he went into one of the company's limits in Pontiac County with which he was not very familiar. They left the camp early in the morning to examine the timber, and Mr. Fraser, who has had great experience in the woods, thought there would be no difficulty in striking camp on their return. Unfortunately he left his compass in a coat in the camp and, as the sky became overcast, it was not possible to judge bearings by the sun. The two men wandered in the woods for three days, during which time much rain fell, and they had no other food than wild berries. They were finally located by search parties sent out from the shanty. When discovered they were on the verge of exhaustion from hunger and weary tramping through a trackless forest.

Railway Companies Will Cancel Cartage Arrangements

After December 31st all agreements between the railway companies and the cartage companies for the handling of freight will be cancelled. This was the decision of the railways at a conference between the companies and the Board of Trade held in Montreal on October 17th. The public will therefore have to make its own cartage arrangements direct with the companies, this applying to all parts of Canada. The railways are determined not to go on with the present system, on the ground that it greatly complicates their business.

Mr. Francis Rosconi, a retired lumberman, died at his residence in Maisonneuve, P.Q., on October 3. Mr. Rosconi formerly carried on business at Actonville, P.Q., retiring twenty years ago. He was 79 years of age.

That's Easy, Get A Linderman

This is what they all say who have tried it out

**DOMINION BOX AND PACKAGE COMPANY
LIMITED
MONTREAL, CANADA**

June 25th, 1913

Messrs Canadian Linderman Co., Ltd.,
Woodstock, Ontario

Gentlemen:—

Answering yours of June 23rd. regarding the matter of Economy in the use of your machines would say that it is pretty early yet to make any definite statement as to the ultimate saving by this process. The gross saving in our case amounts to about \$4.00 per day in labor and about \$4.00 or \$5.00 per day in lumber per machine, not to mention of course the very superior job which we secure and the fact that we can have solid stock of any size at any time. What our net saving would be considering the repairs necessary as against the groovers and squeezers heretofore used, we are of course not in a position to say at this time. If the 8' machine operates as continuously and satisfactorily as the 4' machine has done we are inclined to think that the repairs and replacements on the Linderman Machine would be about the same as upon the groovers and squeezers replaced by them.

We are sorry that we cannot give you more definite information, but you will realize that it is a little early to quote exact figures. In any case, however, we are well pleased with the process and the results and intend to make these figures safe or better them by eternal vigilance in the matter of maximum output and minimum repairs.

Very truly yours,

C. B. FULLER, JR.

Superintendent.

Canadian Linderman Co., Ltd.

Muskegon, Mich.

—Factories at—

Woodstock, Ont.

OPPORTUNITIES

WE own and offer for sale on attractive terms a few especially well selected tracts of timber running from 50 million to one billion feet that are ready for immediate operation, having a good local demand at high prices.

The timber on the Pacific Coast is the last stand of the the great forests. Well selected timber in British Columbia is the best investment on this Continent and offers especially attractive inducements for manufacturers.

EDGINGS

Ontario

Daniel Senecal will erect a box and basket factory at Wyoming, Ont.

A by-law granting a fixed assessment of \$20,000 to the Goderich Organ Company was passed by the ratepayers of Goderich, recently. The company is arranging to make important extensions to its plant.

The Riordon Paper Company have started another digester at Hawkesbury, making 13 machines at their two mills. A fourteenth will be started in a few days, bringing the number up to the maximum.

The Scholey Bros. planing mill at 191-195 Ontario street, Toronto, Ont., was recently destroyed by fire, which is believed to have been of incendiary origin. The loss will be in the neighborhood of \$7,000, which is fully covered by insurance.

The Parry Sound Basket and Veneer Company, Limited, has been incorporated with a capital of \$60,000, to manufacture baskets and crates, and to carry on business as lumber operators, timber merchants and manufacturers and dealers in wood products, with head office at Stoney Creek. The provisional directors are S. D. Biggar, F. F. Treleaven and R. W. Treleaven, all of Hamilton.

A serious boiler explosion occurred in Manley Chew's sawmill at Dollar-town, near Midland, Ont., on October 21st, causing the death of two employees. Three other employees were seriously injured. The boiler and engine rooms were demoralized and the whole mill was moved from its foundation. A fire commenced after the explosion, but was extinguished before causing any damage.

A meeting of the creditors of the Dryden Timber & Power Company, Dryden, Ont., was held recently in Toronto, at which Mr. D. L. Mather, of Winnipeg, president of the company, was appointed liquidator. It is reported that the company will be reorganized and that the liquidator was authorized to borrow \$200,000 to continue operations. Mr. J. B. Beveridge will continue as manager. Operations are being carried on to the fullest extent during reorganization. It is expected that in a few months the affairs of the company will be placed on a sound footing.

The Greater Ottawa Lumber Company suffered another serious loss by fire during the third week of October. The flames destroyed the whole plant and stock of the company, entailing a loss of \$60,000, nearly all of which is covered by insurance. It is thought that over-heated machinery caused the fire. The mill was valued at \$30,000 and the stock at the same figure. The mill was opened two years ago. Rebuilding will commence at once. The company is composed of E. P. Magrath, P. J. Dawson and T. J. McGowan.

The contract for Section 2 of the Welland Canal has been let by the Dominion Government to the firm of Baldry, Yerbarg and Hutchinson, of London, England, and St. Catharines, Ont. The contract price is slightly under \$5,500,000. There are now under contract three sections of the new canal and there remains six sections for which tenders will be called. These tenders will be let with as little delay as possible. The advertisements for section 4 are now practically ready and will probably be issued in a few days.

The Rosedale Saw Mill Company recently complained to the Dominion Board of Railway Commissioners that the Canadian Northern Railway had increased their switching charges from their siding to the C. N. R. interchanges with the C. P. R. and G. T. R. in the Toronto terminals. The sawmill company also charged that the C. N. R. discriminated against them in favor of another lumber company. The C. N. R., at a former hearing had been ordered to furnish certain important information in connection with the case. This information was not forthcoming at the last sitting and Chairman Drayton intimated that if it was not provided soon the Board might be obliged to make an order which the railway company would not like. The railway company's representatives stated that the information would be forthcoming quickly. The Rosedale Saw Mill Company reported that they had been compelled to shut down on account of the increase in the railway company's charges.

The Andrews Lumber Company, Limited, Sault Ste. Marie, Ont., notice of whose incorporation was recently published in the Canada Lumberman, are a Canadian corporation with capital stock placed at \$150,000. The company are operating sixty miles north of the Sault in Alona Bay. They are building a solid rock dock about 1,000 feet long with an "L" across the end about 125 feet long. The dock is 25 feet wide and the "L" 35 feet wide. The company will have 25 feet of water inside the dock. The Andrews Lumber Company have 6,400 acres of mixed hardwood, pine and spruce. Birch predominates in their limits and there is also a small amount of cedar. They are building a circular mill, leaving room behind the saw to put in a re-saw at a later date. They are also building a tie mill, shingle mill and lath mill. In addition to the limits owned by the company there is a great deal of timber surrounding them which can be bought at favorable prices as they need it. The output will be about 4,000,000 feet of hardwood, spruce and pine lumber, fully half of which will be birch; 3,000 to 5,000 cords of spruce pulpwood, 25,000 to 35,000 cedar ties, 5,000 to 10,000 cedar poles and about 50,000 cubic feet of white pine board timber. The mill is being built right on the shore. The company have a large pond and are also putting in a hoist so that they can take logs from the lake and dump them into the pond.

Eastern Canada

W. & J. Reg. Sharples, lumber dealers, Quebec, P.Q., have been registered. Dupont & Frere, sawmillers, Ste. Flore, P.Q., have been registered.

The Provincial Lumber & Supply Company, Montreal, P.Q., has been registered.

R. T. Smith & Company, Hillsdale Avenue, Westmount, P.Q., suffered loss by fire at their sash and door factory recently. The damage amounted to about \$25,000.

The British Industrial Company, owners of large timber limits on the

Salmon River, intend to erect a large paper mill in the lake St. John district, Quebec. The plant will be located on the Ashuapmouchouan River, the chief tributary of Lake St. John.

A large quantity of lumber belonging to Deschenaux Bros., sash and door manufacturers, Verdun, P.Q., has been destroyed by fire. The outbreak commenced in the yards.

Six houses belonging to the Estate James Davidson Lumber Company, together with all their contents, were recently destroyed by fire at Davidson, P.Q. The cause of the fire is unknown.

The Beauce Pulp & Lumber Company, 68 Peter Street, Quebec, P.Q., are considering plans for building a new mill at Scott Junction, P.Q., to replace the one which was recently destroyed by fire.

A meeting of the bondholders of the Chicoutimi Pulp Company has been called by the Royal Trust Company for November 3, to consider a proposal for the exchange of the company's 5 per cent. 30-year bonds into 6 per cent. 30-year bonds.

Active work has commenced upon the creation of the new Forest Products Laboratory which the Dominion Government is establishing at Montreal in connection with McGill University. It is expected that in the neighborhood of \$116,000 will be expended during the first year for machinery, equipment, salaries, etc., and that this sum will be increased from year to year.

The mills of the Argenteuil Lumber Company, Morin Heights, P.Q., have been totally destroyed by fire. The plant was a very good one, the company manufacturing clapboards, shingles and lath. A small electric plant which supplied the district and mills with power and light was also destroyed. The damage is estimated at \$30,000 with \$10,000 insurance. The company were very busy, a large number of orders being in hand.

A. E. Hammond, of Bangor, Me., one of the best known lumbermen on the St. John River, has sold his interests in the Van Buren Lumber Company to Hon. W. W. Thomas, of Portland, Me., and has begun the erection of a new and modern mill at Violette Brook in Van Buren. The mill will have a capacity of about 10,000,000 feet of long lumber and 25,000,000 shingles annually. It is stated that Mr. Thomas, in this purchase, was acting for Stetson, Cutler & Company, who thereby secured a controlling interest in the company. The new owners will not take over the plant until 1914.

The box factory at Wilkins Siding, Queen's County, N.S., belonging to W. H. McElwain, of Boston, which was recently destroyed by fire, is being rebuilt on a much larger scale and the owners expect that it will be ready to start up early in November. The entire supply of box stock, amounting to about 6,000,000 feet per year is handled through this mill from boards furnished to the company on a long time contract by the Sable Lumber Company, of which the W. H. McElwain Company are the managing owners. The Sable Lumber Company have recently started up four of their sawmills and expect to run them continuously until June 1st, 1914. An extremely severe drought which prevailed throughout southwestern Nova Scotia recently, prevented the company from making an earlier start at these mills.

Western Canada

Finch & Withers, lumber dealers, Strathclair, Man., recently suffered loss by fire.

T. D. Robinson & Sons Limited, lumber and fuel dealers, Winnipeg, Man., recently suffered loss by fire. The loss was covered by insurance.

The Fort Qu'Appelle Boat Building & Woodworking Company, Fort Qu'Appelle, Sask., is building a factory at a cost of about \$50,000.

The M. & E. Lumber Company, Limited, has been incorporated at Calgary, Alta., with a capital of \$10,000. Calgary will be the headquarters.

The Hanbury Manufacturing Company, Brandon, Man., have postponed, until the summer of 1914, their plans for extending their plant for the manufacturing of office furniture and fixtures.

The Everett Pulp & Paper Company has been incorporated in British Columbia with head offices at Vancouver. The capital stock is \$672,000. The company intend to erect a pulp and paper mill in British Columbia.

The Vancouver Lumber Company, Vancouver, B.C., has agreed to accept the award of \$16,875 and \$2,500 costs made to them in the recent arbitration proceedings against the city of Vancouver for damage done to their property by the construction of Connaught bridge. The plaintiffs have claimed damages amounting to \$519,000.

The Weeks Dunell Cedar Company has been incorporated in British Columbia with capital of \$50,000 and head office at Fanny Bay. The company will take over the option for the purchase of a portion of district lot 43, Newcastle district, Vancouver Island, from Geo. Stevens. The objects of the company are to carry on business as manufacturers of and dealers in cedar and other shingles, also to manufacture and deal in various other lumber and timber products.

The Bishop's Crossing (P.Q.) Sash and Door Company, Limited, has obtained a Quebec charter. The capital is \$30,000. The incorporators are: E. B. Evans, Julius W. Bishop, Thomas E. Evans, Thomas L. Tite and Hector H. Dunn, all of Bishop's Crossing.

The recent railway disaster on the Midland Railway, in England, in which a number of people were burned to death, causes the Chemical Trade Journal and Chemical Engineer to say that it is "urging no counsels of perfection, but that it is perfectly practicable to render wood non-inflammable, and for a long time past all the woodwork employed in the construction of the rolling stock on the underground railways of London has been so treated." The idea that steel cars should be constructed for passenger traffic does not seem to meet with any great consideration at present.

Wanted Lumber

WE are in the market and pay cash for 1" Cull Birch, 1" Cull Elm, 1" Cull Maple, and No. 2 Hemlock, for stock both in shipping condition and to be sawn.

Correspondence with mills solicited for above mentioned stock and for any other lumber, lath or posts you may have to offer.

“Hamilton” Sawmill Machinery

We're specialists in machinery for stationary sawmills, and, as we have never built any other kind, our machinery is the result of over fifty years' concentrated experience.

It is therefore better—in design, workmanship and operation—because our knowledge of these things is exact, and we have worked all our knowledge into our machinery.

It is always built to produce lumber economically—our line includes **circular gangs, stock gangs, twin circulars, steam tension band mills** and **steam set works**—some of the most successful labor and time-saving sawing machines built.

Do you know of another builder who **manufactures them all**?

As we build all these machines in different sizes, we are able to give you exceptional service.

Write us when you need machinery

William Hamilton Company, Limited

Peterborough, Ontario

“Brazel Patent” SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9' wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. **Brazel Plows** cut 6" wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fills up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12" of loose snow each time the plow passes over.

The Correct Belt for Every Kind of Drive

Use Scandinavia

- On your main drives and on all direct drives whether straight or crossed.
- On wet drives, provided belting stays wet.
- In places where it is hot.

Scandinavia has good surface for clinging to the pulley, runs true, is flexible and enormously strong.

"Circumstances alter cases" when choosing the right belt to get longest and best service. Write us about your belting problems. We can save you money. Send to-day for copy of THE MAIN DRIVE.

Use Lanco Balata

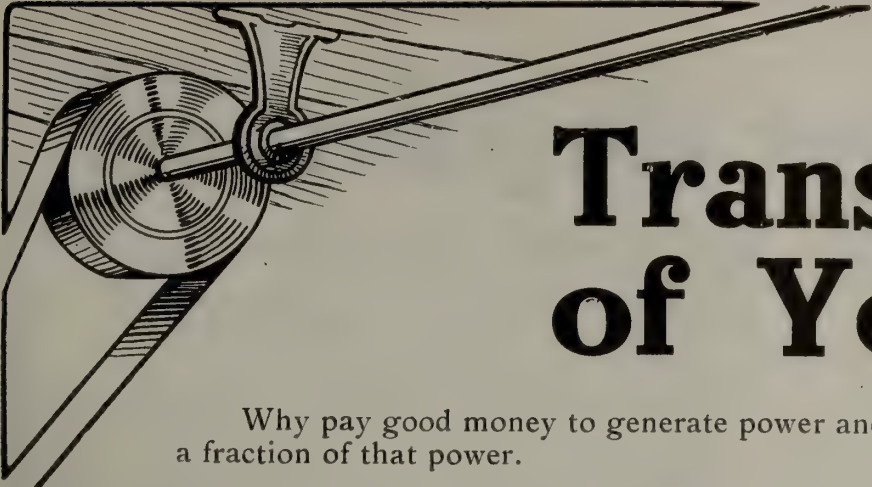

- Where the conditions are constantly changing from wet to dry.
- Where belt must run under extremely cold conditions.
- Where you want an endless belt.

Lanco Balata will stand up under high speeds. It is impregnated with pure balata gum ensuring the highest service giving quality.

Toronto

Federal Engineering Company, Limited

Montreal

Transmit 100% of Your Power

Why pay good money to generate power and then employ a poor belt that will only transmit a fraction of that power.

If you equip your mill with Goodhue Belts you can transmit 100% of the power generated.

Goodhue Belts stretch 15% to 25% less than other belts and have just the right amount of "cling" on the pulley.

Write us for particulars and prices.

**YOU CAN DO
IT WITH— A GOODHUE BELT**

J. L. GOODHUE & COMPANY, LIMITED.
DANVILLE, QUEBEC CANADA.

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

Results from logs of given dimensions cut on Breeze, Denison & Co. pat. band mill.

Diam.	Log Length	Feet Lum.
8in.	16 ft.	45
10	12	54
10	16	69
11	15	96
14	16	171

by using our
**Patent Steel Band
Mill and Carriage**

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

Are your horses of use to you?

This seems an absurd question—and the answer is always
"Of course they are"—In which case provide your stables with:

Johnson's Reliable Veterinary Remedies

Johnson's Horse Liniment, No. 1 (Alcoholic)

1 gal. jugs (Imperial)	\$4.50 gal.
1 lb. bottles	8.00 doz.
2 lb. bottles	15.00 doz.

Johnson's Horse Liniment, No. 2 (an oil liniment)

1 gal. jugs (Imperial)	3.00 gal.
1 lb. bottles	6.00 doz.
2 lb. bottles	11.00 doz.

Johnson's Horse Colic Remedy

A sure and speedy cure for all kinds of Colic	
1 gal. jugs (Imperial) 40 doses	5.00 gal.
1 lb. bottles 4 doses	8.00 doz.
2 lb. bottles 8 doses	15.00 doz.

Johnson's Veterinary Healing Ointment (Gall Cure)

2 lb. tins	2.00 per tin
4 oz. tins	3.50 doz.

Johnson's Condition Powders (Concentrated)

1 lb. Packages	3.60 per doz.
----------------	---------------

Johnson's Camp and Household Remedies, such as Cough Syrup, Healing Ointment, Headache Powders, Big 4 Liniment, Stomach Bitters, Cathartic Pills, etc., etc., have stood the test of twenty-five years and are in use all over Canada, from the Atlantic to the Pacific. Prices are lower than those of all other manufacturers. Letter orders receive prompt attention.

A. H. Johnson, Wholesale Druggist, Collingwood, Ont.

Are Your Horses in Good Condition?

Horses for all lumber work are subjected to the hardest hauling under the most severe conditions. They should therefore be as fit as all possible care and attention can make them.

**In the Lumber Camp,
Around the Mill, In the Yard**

and wherever lumber has to be hauled the horses are always liable to a multitude of small injuries which if not attended to promptly may develop into lameness or disfigurement, thus reducing the working capacity of the horse and impairing its value from a sale standpoint.

You should always have handy and ready for use

Good Liniment

to reduce bruises, strains, soreness; allay pain and inflammation quickly, be an antiseptic dressing to a cut or burn, or to heal a wire cut, wound or laceration.

ABSORBINE

is an antiseptic healing preparation as well as a resolvent and a discutient. It will assist nature in bringing about a dissolution of the bunch, restore the circulation, gradually restoring the part to its normal condition.

It will produce permanent and complete results without blistering or removing the hair, and will leave no blemish. You can work the horse at the same time.

All enquiries on special cases answered without delay—full information and instruction on request. Absorbine \$2.00 per bottle at dealers or express prepaid.

Tools You Can Rely Upon

Cutter Heads for Jointing

For jointing the edge of a board or plank the Shimer Jointer Heads will be found to be superior tools. The Bits begin cutting at the top and shear downward, leaving the corner of the plank or board full, with a clean cut finish across the edge. They will be found very complete tools for the purpose and are shipped out under our guarantee to give satisfaction.

Price, complete to joint 15-16 to 1 1/4 in. lumber \$31.20. Extra Bits to joint 1 1/2 to 2 in. lumber \$1.56 each.

Heads for making Ship Lap

The Shimer Cutter Heads for Ship Lap are so proportioned in the Bits and their seats that a perfect draw cut is made. They work interchangeably with our Matcher Heads and always produce good work.

Price, per set, complete \$33.64 to \$38.48 according to thickness of cut. Extra Bits for making Wainscoting on these Heads, \$1.95 each.

These tools will keep your work up to standard and save you all the fitting and trying. For particulars address

SAMUEL J. SHIMER & SONS, Galt, Ont., Can.

WHY you should install the Mahony Blower

System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses 1/3 less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

Griplock Riveted Chain Belt

Section of Griplock Riveted

No More Breakdowns—No More Delays

This is the slogan that users of **Griplock** Chain Belt have adopted. No hooks to be opened up, no breaking of chain belt in **Griplock**. **Griplock** is so constructed that it will withstand the severest kind of service. It is built by the Chain Belt Company, Milwaukee, Wis.; a concern that fully understands the requirements of the Lumber and Saw Mill Trade.

We would be very glad to mail you sample links for your inspection.

JM Asbesto- Sponge Felted Pipe Covering

**The Ideal Insulator for
High Pressure Pipes**

Made up in laminated form, like the leaves of a book, J-M Asbesto-Sponge Felted Pipe Covering confines a large number of small particles of dead air between the layers. Thus maximum insulating efficiency is secured. The layers consist of thin felts composed of pure Asbestos fibres and finely ground sponge, forming a real cellular fabric.

J-M Asbesto-Sponge Felted Pipe Covering is tough yet flexible, and is practically everlasting. It can be removed and replaced as often as required without injuring its efficiency. For high pressure and super-heated steam pipes it has been proved by years of severe testing to be without an equal as an insulator.

Every Millman Should Have This Book

IT describes fully the requirements of good machine knives, the making of Disston Knives and pictures a large number of the various patterns of knives which we make.

We have been manufacturing Disston Knives for over a quarter of a century, during which time, each year has added to their fame.

Fully equipped with modern machinery, possessing every facility for producing high class work, and using Disston Crucible Steel exclusively, it is not surprising that the largest knife users everywhere will use no other knives.

Another Successful Record made by Cling-Surface. This time on a Rope Drive.

You wouldn't think that this short length of rope had transmitted power for five years and out in the open where it was subjected to rain, sunshine, frost and the storms of the lake regions.

The remarkable preservation of both exterior and interior under such severe duty is the direct result of proper treatment with Cling-Surface.

The rope shows slight wear on the surface, but rope drives seldom fail because of surface wear. Failure usually begins at the core where severe rubbing of fibre against fibre occurs. Cling-Surface penetrates and lubricates every fibre, to the very center. Close contact and firm grip on the driving and driven pulleys are thus secured, power losses are minimized, the drive is waterproofed throughout (Cling-Surface will not wash off in the rain), and initial tensions may be reduced to such an extent that free, easy running becomes practical as in this case.

Cling-Surface is used and recommended by the largest makers of rope.

Whether your drive is belt or rope, indoors or out, you need Cling-Surface. Give us a chance and we'll prove this to your complete satisfaction.

Send us a first order now, or at least ask for literature.

A LITTLE MACHINE WITH A BIG REPUTATION

This machine grinds and gums knives and saws with the greatest accuracy.

There are thousands in use in every spot of the universe.

We make a specialty of all kinds large and small saw and knife tools.

SAMUEL C. ROGERS & CO. 18 LOCK ST. BUFFALO, N. Y.

DIXON'S GRAPHITE WIRE ROPE GREASE

Combines the function of a perfect lubricant with that of a perfect rust preventive. It cannot be washed off or decomposed by acid or by alkaline water. It penetrates the rope and minimizes wear. Its use will cut down your wire rope expense. "Wire Rope Lubrication," No. 238, explains the best lubricating methods.

RUBBER GOODS FOR LUMBERMEN

Belting Our long experience in the making of Rubber Belts enables us to specialize on this line. "Monarch," "Red Strip" and "Lion" are our leading brands for power transmission. (Write for Booklet B-1.)

Packings "Redstone" High Pressure Sheet Packing has proved by test that it will outlast any other similar packing on the market. We make Spiral and Ring Packings, etc., that are equally reliable. (Booklet P-1.)

Hose for Steam, Water, etc., etc., in various grades, made especially to give satisfactory and economical service under different conditions. (Booklet H-1.)

Fire Hose One or more of our twenty brands of Fire Hose will be found, not only in the best equipped Factories, Mills, etc., but in almost every Fire Department in the Dominion. (Booklet H-1.)

Two Factors With Which You Are Familiar Regulate Timber Values

Supply—it cannot increase during the life of this generation.

Demand—for wood and wood products will not decrease during the life of this generation, if ever.

Caught between these two forces which are moving toward each other steadily, timber values literally are being

Shoved Up

by the pressure behind them.

For these reasons timber is a good investment whether bought for present or future operation or as an investment.

Timber now is being offered at prices which will make your investment profitable, not in many years but a few years.

You are entitled to information about timber bargains. Ask for it.

BUILT FROM EXPERIENCE

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service and often in localities where repairs cannot be made without great inconvenience.

When you want a locomotive you cannot afford to overlook the experience of this company.

Experience in building large locomotives is invaluable in connection with the design of smaller ones in order to insure reliability which is the main question in logging work. You know what delays cost you.

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works
Philadelphia, Pa., U. S. A.

HEISLER GEARED LOCOMOTIVES

Engine being operated by the Trout Creek Logging Co., Ltd. of Trout Creek, Canada

Especially adapted for heavy hauling on steep grades, sharp curves and uneven tracks. For logging, switching and pulling on main lines, mills, furnaces and industrial purposes.

FLAT GANGS Unexcelled in the manufacture of

Flooring Strips
Silo Stock

Cedar Siding
Door Stock

Boards

Shiplap
Box Lumber

from cants and flitches, from either hard or soft woods.

ROUND LOG GANGS

JUST WHAT THE NAME IMPLIES—taking all your small logs just as they come from the pond and cutting them up into boards or dimensions, getting every board there is in the log, never over-slabbing (wish we could say this of all head sawyers.) Built to handle either one or two logs at once, up to 14 in. diameter.

KEEP THE SMALL LOGS AWAY FROM THE HEAD SAW and CARRIAGE entirely, raise your cutting capacity, and install economy by the same stroke.

Not an **EXPERIMENT**, but an **ECONOMIC NECESSITY**.

Think it Over Carefully, then Write us for Details.

"Dunbar" Shingle Mill

THIS mill is acknowledged the most complete and satisfactory shingle mill on the market. It has a capacity of from 15000 to 45000 per day according to the quality of the lumber.

Our literature contains full particulars.

Maritime Foundry & Machine Wks.

Limited

Chatham,

New Brunswick

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited
ORILLIA, ONT.

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

Waterous No. 0 Portable
Sawframe—carries 60" saw
"Best by Test"

CIRCULAR SAWFRAMES

For Portable, Medium and Heavy Mills

WATEROUS Circular Sawframes are built to suit every mill size. Their capacity ranges from 2000 to 25000 ft. per day. Every frame we build is supplied with a heavy mandrel

of larger diameter than is the general custom. Three bearings are used to support it. Fittings include wide-faced powerful iron and paper friction feed-works, disc wheel splitter, timber guage, belt tightener, and rigid and quickly adjustable saw guide.

In the design and construction of these Frames we have worked from the operator's view point and have combined in them convenience, accessibility and simplicity of handling, with exceptional strength and accuracy.

For many years the No. 0 Sawframe, which is shown in the cut above, has been sold as part of our Portable Outfit, and its indorsement has been universal. The heavier frames of cast iron and steel construction throughout have also been given the test of years of actual service, and with improvements suggested by this use have made good wherever installed.

A new catalogue, No. 110, of Sawframes and Accessories only, has just come in from the printer—we have a copy here for you.

Waterous No. 1 Sawframe—takes 60" saw—weight, 2300 lbs.

North Tonawanda, N. Y.

James W. Sewall

For eleven years my business has been growing. Since 1910 I have made detailed timber estimates and maps of over 700,000 acres of land. In 1913 on one contract alone I planted 200,000 trees. Experience and system aid correctness and efficiency. Let me serve you.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |

POWER PLANT

- | |
|---|
| 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| 2 Double Duplex, high pressure Water Pumps. |
| 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| 2 125 h.p. Water Wheels. |
| 1 Upright Engine for sawdust conveyer. |
| 1 10 h.p. Engine. |
| 1 Mitts & Merrell Hog. |
| 1 Wood Machine for 22-in. wood. |
| 1 Wood Machine for 16-in. wood. |
| 1 Edger for ripping dry lumber, installed. |
| 1 Edger for ripping dry lumber, not installed. |
| 1 30 h.p. Generator, 250 volt. |
| 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- | |
|--|
| 1 Automatic Filing Machine for 12-in. D.C. band saws. |
| 1 Automatic Grinding Machine for 8-in. S.C. band saws. |

"DEFIANCE" Woodworking Machines

are known the world over as the most economically operated tools on the market to-day. This has been proven in the largest and best equipped woodworking plants where quality and quantity is desired.

A superior example of a finely constructed machine is shown herewith as our new

NO. 1 HUB TURNING LATHE

It is the largest and most powerful machine of its kind ever built for making carriage and wagon hubs of different sizes and shapes up to 18 in. diameter, 18 in. long at the largest. It receives the block in its rough state, performs the roughing, turning cupping, finishing the ends, cutting beads and shoulders for bands, all at one operation.

It is heavy and well built and will perform a vast amount of perfect work.

You should know more about its good qualities. Write us for particulars and price.

THE DEFIANCE MACHINE WORKS DEFIANCE, OHIO, U.S.A.

Representatives:—A. R. Williams Machinery Co., Toronto (Ontario), St. John (New Brunswick), Winnipeg (Manitoba), Vancouver (British Columbia), Reid-Newfoundland Co., St. Johns (Newfoundland), Williams & Wilson, Montreal (Que.), W. L. Blake Co., Portland, Me. (Maine, New Hampshire and Vermont).

NO. 1 HUB LATHE

"The Narrow Saw King"

The Narrow "Saw King" Cross-Cut Saws have won their way to universal popularity by the good work they do and their general reliability. They have been put to every test and come through successfully, proving that they are worthy of the confidence placed in them. If you want the best results, use a Narrow "Saw King."

The Narrow "Saw King" Cross-Cut is specially adapted to Pulp wood and Small timber being a straight back Saw and ground to a true taper, three gauges from cutting edge to back of saw.

Our Double Band Mill, Huttig, Ark.

Why We Can Give "Value Received"

We Own one hundred thousand acres of the best virgin Southern Hardwood timber.

We Operate large band mills at Huttig, Ark., and Deering, Mo.

We Cut Forty Million feet of hardwoods annually and carry 15,000,000 feet in stock.

We Sell only stock cut on our own mills and so can **GUARANTEE** the quality of every shipment.

We Ship high grades that increase the size and percentage of your cuttings, reduce factory costs and shrink the waste pile. Therefore:

We Can save you money on every shipment of oak, ash, gum, elm, cypress, tupelo, hickory, cottonwood, sycamore, soft maple and dimension.

*Let us prove this on your next order.***Wisconsin Lumber Co.**

**The Truck That Saves It's Cost Several Times Over in The Year**

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9' wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. **Brazel Plows** cut 6" wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fills up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12' of loose snow each time the plow passes over.

Goodyear Conveyor Belt for the Rainy River Gravel Co., Vancouver. Made in one piece—seven hundred and fifty feet long.

A seven hundred and fifty feet Goodyear Conveyor Belt in actual service at Rainy River, Vancouver.

Part of an order of 140 rolls of Elevator Belting for the Saskatchewan Government Elevators

Special Belts for Special Purposes

Goodyear Imperial High-speed Belting

For high speed a High-speed Belt should be used. Great strength is demanded. A belt that is to grip a small pulley and transmit high power must be specially built for the purpose. It must resist the strong tendency to slip on the small, rapidly-revolving pulleys.

This Goodyear High-speed Belt is made with a friction surface that grips the face of the pulley—conveying *all* the power.

It gives long service. The Belt is durable because there is no internal friction—no ruinous grinding. That is where the Imperial High-speed Belt excels. It flies around a small, high-speed pulley without setting up internal friction.

In Goodyear Belts the elimination of all stretch, and the solid cohesion of duck and rubber, prevent any movement within the belt. Thus the Belt gives long and efficient service.

Elevator Belts

Elevator Belts are a Goodyear specialty. The essential requirement in these belts is strength—and Goodyear Elevator Belts have it. That is why they are in constantly-increasing demand. The buckets do not pull out. Long wear in the belt is assured because the plies of fabric do not separate in service. Goodyear Rubber Belts are used in hundreds of elevators throughout Canada.

Conveyor Belts

Where a sound and reliable belt is needed for hard service—for the conveying of stone, grain, ore, coal, etc., a Goodyear Conveyor Belt specially made for the work is the best investment. The Goodyear Conveyor Belt has a rubber face of great toughness, which prevents cutting and chipping, and increases the life of the belt. Not affected by weather. We make Conveyor Belts to any specifications. No better conveyor service can be given than that obtained from a Goodyear Belt.

Endless Belts

We make Endless Belts to order in any width, length and thickness—and for any purpose.

Send for our interesting book on the choosing of a Belt—you'll find it useful. It is free.

The New Hanchett Swage Shaper

For Bands, Gang Circular and Cylinder Saws

Is a Shaper that you will like and swear by. It has the simplicity, adaptability and efficiency that you have been looking for in a shaper. The instant you look upon it, it impresses you; when you put it upon your saws and feel how easily it slides from one tooth to the next—not a hitch nor a catch except when it is flush in the tooth stop; when you feel the perfect balance and note the perfect alignment of the teeth; the simplicity and perfect adjustments throughout—it appeals to you. When you see the efficient work produced—it convinces you, it captivates you. WHY? Because it is made to suit you; to fit you; to meet your requirements, after we have given nearly a quarter of a century to the study of your needs.

Note the cuts shown herewith. Note the lateral adjustment of the tooth-stop by means of a conveniently located knurled screw; the straight up and down adjustment of both the tooth stop and back rest; by the same means. With this construction, no adjustment is necessary in changing from short space to long space teeth. Note the manner in which the tooth-stop is held—a groove at the side and the adjusting screw at upper corner, thus there is no obstruction of any kind in the line of travel of the saw from back to front except at point where tooth engages tooth-stop. This insures a free riding shaper and a positive stop at the desired point. Note the action of the dies, controlled by a centre control lever giving balance to the shaper and causing the dies to move in unison against the tooth. you will find this shaper 100 per cent. efficiency. Wouldn't you like to know more of this new shaper?

Write for one on 30 Days' Approval, to be returned if it isn't the best shaper you have ever used.

SPARTAN BELTING

*Dominant in the Field
of Hard Service*

Spartan Belting like the Spartan men of old is intensely strong and durable, resisting absolutely those abnormal conditions which rapidly ruin ordinary belting.

Planers and matchers that eat up lumber at the rate of 200 to 300 lineal feet per minute demand the maximum efficiency in belting equipment.

Spartan Leather Belting

is built especially for those high speed drives. It stands hard service on small pulleys because of its unusual flexibility which ensures a firm and instantaneous grip.

We guarantee that **Spartan Belting** when used under the same conditions will transmit more power and with greater economy than any other form of transmission.

Send for Spartan Book and our Text Book the Care of Belting. Both are free and sent by return mail.

 Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

No. 22

A Weakness in Business Methods

At most of the conventions of lumbermen and in fact at business men's conventions in general, an important subject of discussion is that which involves terms of credit. Both in Canada and the United States, the varying conditions under which business institutions have developed and are now being conducted have led to the creation of a great many different systems of charging customers for credit. So widely different have these customs become in both countries that one is obliged in practically every case to give close scrutiny to the question of interest payment before quoting a price upon an enquiry. As to the actual methods of granting credit, there is a fairly uniform custom of quoting a net price at a date a month or two distant, with a discount for immediate payment and a rate of interest payable after the expiration of the date of net payment. The difference in practice, in different parts of the country, develops after the passing of the date of net payment.

Everyone in business knows that the ideal customer is the one who pays cash and saves the discount. Business, however, is based upon the credit system, and those who can follow the cash payment principle are comparatively few. Therefore, the net cash price, on a date a month or two distant has become the accepted method of quoting prices. The lumber business is conducted almost entirely upon this basis, a system which works out fairly equitably because of the time which so frequently elapses between the giving of an order and the delivery of the stock.

It is unfortunate that the members of the lumber trade in Canada are not sufficiently united to take a definite stand upon the whole credit system and to adopt rules, varied possibly according to the necessities of the different districts, but which can be enforced with fairly general strictness, defining just what shall happen in connection with the adding of interest to an account after the passing of the

date for net payment. Practically every business man places at the head of his business stationery a statement as to the conditions upon which he is prepared to grant credit, but how many of them live up to it without impartiality? The prosperity of Canada and its rapid development of late years have tended to make business men much more lax upon this question than they should be, and today, when a species of slight business depression is felt, the awkwardness of this way of doing business becomes a matter of much concern. During recent visits to large wholesale lumber dealers the Canada Lumberman has frequently been invited to discuss this matter and has found that the trade is, with encouraging unanimity, coming to the conclusion that they must enforce the payment of interest after the expiration of the date of net payment.

In the first place, this is nothing but a just arrangement. It results in each customer getting for his money exactly what every other customer of the same firm gets. Under the rather loose custom formerly prevailing, and even to a large extent prevailing today, a man who makes payment upon the net date frequently gets less for his money than a man who makes payment at a later date, because the creditors have been too easy on the latter and have not enforced the payments of interest. Every business man is entitled to take such a course if he pleases. He may make a present to any man he likes of the interest upon his debt to him, but the practice is unfair to those who pay promptly and to those who take discount and make immediate payment. Moreover, the practice is one which, except in the cases of rare exceptions, cannot be defended upon business principles.

Strict adherence to the principle of insisting upon the payment of interest will keep many a sound company from stretching its credit beyond the danger limit and make it certain that they will do a steady and profitable though smaller business, rather than take chances and possibly come to grief from presuming too far upon their ability to carry credit. The trouble with Canadians in the lumber business is that they have been brought up upon the credit system so-called, which in many cases becomes, not a genuine credit system; but a charity system, based upon the failure of many companies to insist upon interest on past due accounts.

So general has this become that many companies expect such treatment in the majority of cases. What is actually needed is very definite laws in regard to the legality of collecting fixed rates of interest after the net date and a general unanimity on the part of the trade to line up to them. It would be well worth while for the lumbermen of Canada, through their various organizations, to start a campaign with this object in view. No absolutely hard and fast rules are required, which would involve a man or a company in ruin under exceptional cases. What is wanted is a generally recognized custom of paying interest when interest is due and not simply paying when it is insisted upon by legal pressure. Such conditions would make the lumber business a far more profitable and pleasant one for all parties engaged in it.

Canada's Foreign Lumber Trade

Exports of forest products from Canada during the month of June, 1913, were valued at \$4,323,636. This was nearly \$300,000 less than the total for June, 1912, but \$50,000 greater than the total for June, 1911. The greatest total during the last decade was in June, 1906, when exports of forest products were valued at \$6,935,917. Exports of forest products during June, 1913, stood third in the list, being exceeded by agricultural products, of which the value was \$15,492,137, and products of the mine, of which the value of exports was \$4,721,731. These figures relate to the products of Canadian forests, and do not include foreign produce exported from Canada.

During the three months ending with June, 1913, the exports of forest products were valued at \$9,232,914, being \$263,511 greater than the total for the corresponding three months of 1912, and \$1,114,141 greater than the total for the corresponding three months of 1911. The total for the corresponding three months during 1906 was \$12,347,074, and in 1910 the total was \$10,043,175.

Exports of deals (spruce and other), during the three months

ending June, 1913, were valued at \$1,364,402. During the corresponding period of 1912 the total was \$1,279,558 and during 1911, \$1,166,242. The exports of deals were largely to Great Britain, the total to that country during April, May and June of the present year having been valued at \$1,149,356.

Exports of planks and boards during the three months ending June, 1913, were valued at \$4,190,092, of which the United States took planks and boards to the value of \$3,265,322. During the corresponding three months of 1912 and 1911 the exports of planks and boards were valued at \$4,073,844 and \$3,758,187 respectively. It will thus be seen that in the principal exports of the lumbering industry to the United States and Great Britain, there was an increase for these three months during 1913 as compared with each of the two previous years.

The total exports of woods and manufactures of wood from Canada to all countries during these three months also showed an

increase as compared with the two previous years, the totals being as follows:—1913, \$10,466,699; 1912, \$10,170,569; 1911, \$9,282,133.

Imports of planks and boards during the three months ending June, 1913, were valued at \$1,515,742. Of this total the imports from the United States were valued at \$1,374,314. During 1912 and 1911 the imports of planks and boards were valued at \$1,899,745 and \$1,446,076 respectively. The imports this year were therefore about \$380,000 less in value than during 1912, but \$70,000 greater than those for 1911. The imports of planks and boards free of duty from the United States during these three months in 1913 were \$250,000 less in value than during 1912 and \$90,000 greater than during 1911. Total imports of wood and manufactures of wood into Canada from all countries during the three months ending June, 1913, were valued at \$7,242,217. During the corresponding three months of 1912 and 1911 the values were as follows:—\$7,056,020 and \$5,195,892 respectively.

Are Railway Companies Honest?

One of the most frequent subjects of discussion in lumber offices is the unsatisfactory and inexcusable situation which exists all over the country in connection with claims made upon railway companies for overcharges upon shipments of freight. It is the universal practice of railway companies of Canada and in other countries as well, to delay as much as possible in the settlement of such claims and harass the shipper to such an extent that in many cases the claim is dropped and the railway company puts the money into its pocket. It is quite possible, at the expense of considerable, to secure settlements on these claims from the railway companies. A few progressive firms are doing so to-day. It is necessary however, to establish a definite system of following up all correspondence with the railway companies and practically to devote the attention of separate department of the business office to the work. When this is done and considerable expense is incurred, very good results are obtained. Under present conditions this is the only course that can be adopted.

In the long run this tax must come out of the pocket of the consumer and add unnecessarily to the serious cost of living. If the facts could be got at, it would unquestionably be found that this policy on the part of the railways is directly responsible for much of the high cost of living in connection with every article of merchandise. There is actually in this connection a great waste of money. It is a waste which could quite properly be taken into consideration by the Conservation Commission. It is one of those wastes which can be stopped and for which there is no excuse. Railway companies may have difficulties, peculiar to their own business, which entitle them to put a tax of this nature upon the public, difficulties which do not apply to other industries and businesses, but if they have, it is still to be demonstrated. We do not believe that they are in any way entitled to evade the generally accepted rule of honest dealing and to put into their pockets great sums of money collected annually in this way. In some manner, the laws of the country, or their enforcement are sadly inadequate in this connection.

Take for instance the simple matter of allowances made in connection with the weight of flat and box cars. During the summer an allowance of 500 lbs. is supposed to be made for box cars and 1,000 lbs. for flat cars. From November 1st to April 30th a special allowance of 500 lbs. extra, making 1,500 lbs. in all, is provided for, in the case of flat cars. How many firms are getting this allowance regularly? Every lumberman with whom we have had the opportunity of discussing this matter declares that he has to fight the railways continually to get this allowance. In every case the claim of the lumberman for overcharge is either right or wrong. If it is right, no great amount of correspondence should be necessary before the railway companies admit the overcharge and make a refund. Whenever it happens that the claim is wrong, the railway companies lose no time in advising the claimants to this effect and showing that, when its own interests are at stake, it can act quickly enough. If the interests of the shipper only are at stake, the policy of the railway companies is, with practically no exceptions, to harass him, in the hope that he will grow sick of the trouble and abandon the claim. This is going on all the time

and the railway companies are retaining moneys to which they are not entitled. It amounts simply to a case of theft, for which they can depend upon not being brought to book, for, if the claimant sticks to his guns long enough they finally make payment and dispose of the matter. If statistics could be secured they would show that the percentages of cases in which the railway companies treat the claimants in a business-like manner is so small as to be practically negligible.

After discussing this question with a number of lumber firms, the Canada Lumberman wishes to offer a bit of advice to its readers, which, if accepted and acted upon, will in the end, be of much value to them. It has been proved conclusively that persistent following up of claims against the railway companies will bring results in the end. Lumbermen should, both in their own interests and in the interests of the consumers, adopt such a plan. A large firm of wholesalers, well known in Ontario, looks after the matter in the following way. A duplicate is kept of every communication sent to the railway companies in regard to claims. Each claim is numbered. It will be found that the railway companies always acknowledge the first letter. This acknowledgement is noted, by the firm in question upon the duplicate copy of the original letter which was sent the railway company. A short time is allowed to elapse and a second letter is sent. This is not likely to bring a satisfactory reply, if any at all. It is followed by other letters at regular intervals. Unless this practice is followed out systematically, the policy of the railways to defer action will eventually have an influence upon the claimant and induce him to allow the claim to drop. The firm referred to above showed the Canada Lumberman a record of the claims which it had made and had followed up persistently. Out of a large number of claims which had thus been made, less than two per cent. had been turned down by the railway companies. This company makes a practice of presenting only claims which it knows are entirely justified and follows them up without fail until a settlement has been secured.

Referring again to the matter of allowance upon flat cars, it is important to note the situation in connection with the I. C. R., a government-owned railway. This company, being a government institution, is not subject to the Dominion Board of Railway Commissioners. Its tariffs are arranged to suit itself. Instead of making an allowance of 1,000 lbs. and 1,500 lbs. on flat cars in summer and winter respectively the I. C. R. makes an allowance of 500 lbs. the year round on lumber only. No allowance is made for shipments of shingles. If it is unfair to collect freight upon snow, ice, rubbish, etc., carried on a car of lumber, it is equally unfair to collect it when carried upon a car of shingles, but the I. C. R. does not see it this way.

While on the subject of railway exactions, mention should also be made to the minimum carload trouble, a source of much heartburning on the part of lumbermen. Recently the minimum for cars 36 ft. 6 in. long and under was raised from 30,000 lbs. to 34,000 lbs. and other minimums were advanced in proportion for larger cars. There are many cases in which it is quite impossible to load a car to this capacity. The shipper is therefore charged freight upon several thousand

pounds which have not been carried. The railway company receives payment for a service which it has not rendered. All of the light weight varieties of lumber which make up a large proportion of the shipments in Canada are frequently subject to this overcharge. Special sizes moreover, cause even greater trouble. Long lengths cannot be loaded profitably upon cars. For instance a 2 in. x 10 in. 20 ft. long causes a great loss to the shipper, because two such pieces cannot be loaded end to end upon a 36 ft. 6 in. car. A great deal of space has to be left vacant, but the shipper is obliged to pay freight upon the minimum carload.

These transportation questions have always been a great tax upon the lumber business, which depends very largely upon freight rates for its prosperity. Up-to-date it seems as if the railway companies have

had things pretty much their own way in the matter. The Board of Railway Commissioners have had various aspects of the question before them from time to time, but little of value to the lumber industry has been accomplished. Until the lumbermen as a class are prepared to realize the importance of united action upon the matter and to adopt a systematic campaign, it is not likely that much will result. The fact however, that good results have been secured by individual firms in connection with the matter of overcharges, indicates clearly that good results are possible in a large way, if a representative body of lumbermen will take up the matter and gradually educate both the railway companies and the Board of Railway Commissioners to a full realization of the injustice which is being done not only the shipping public, but above all to the consuming public.

War and Western Pine

An interesting diagnosis of Western Canada's financial indisposition, was published recently in the American Lumberman. The article, which is entitled "War and Western Pine Exports," brings to mind "The House That Jack Built" and contains so clear an outline of a troublesome problem, that we reprint it as follows:—

If Turkey had not precipitated a war with the Balkan States France would have no reason to scent a panic. If France had not foreseen a panic, or imagined that one was close at hand, it would not have turned so many of its securities into gold coin. If France had not attempted to realize gold on its securities the Bank of England would not have depleted its gold reserve in helping France to avert an imaginary panic. If the Bank of England had not depleted its gold reserve it would not have been necessary to call upon Canadian banks in Toronto, Montreal, Quebec and Ottawa to take up time loans and send gold to the Bank of England. If the Canadian banking system were other than a chain of branch banks, working under the direction of the banks of the four largest cities of eastern Canada, the western Canadian banks, especially in the Prairie Provinces, need not have acceded to the demand made by the banks of eastern Canada in their efforts to meet the demand made upon them by the Bank of England. If the money that was deposited in the branch banks of western Canada last spring had been allowed to remain, their development would have kept pace with former years. If development in the Prairie Provinces had maintained its usual standard Canadian imports of western pine would not have dropped to the present low level.

No better illustration of the far reaching effects of war can be drawn than that which the Balkan trouble had upon the Canadian financial situation. The western pine region is the nearest source of timber supply to the Prairie Provinces of Canada; therefore imports

of western pine by Canada serve better to illustrate the low ebb of Canadian finance than would those of other kinds of wood. Comparative figures on the cut and shipments of western pine for the first nine months of 1913 and 1912 will be found on page 28. These figures show that Canada, during the first nine months of 1912, imported 68,861,273 feet of western pine and during that first nine months of 1913 only 18,940,563 feet were imported. Thus it will be seen that imports of this wood dropped 50,000,000 feet during the first nine months of this year, compared with the same period of 1912.

The association reports of cut and shipments from various sections of the United States show, in many instances, curtailment of production, but in no instance can there be found such a glaring decrease in shipments to any one locality as from western pine territory into Canada.

In western Canada there was a good yield of practically all crops, but farmers who are disposing of their product find it necessary to sell at a price that nets them a low percentage of return compared with returns in previous years. Crop returns this year were sufficient to warrant much development in the Prairie Provinces, which in turn would have called for considerable lumber from western pine territory, but as long as the Canadian financial situation continues to linger in the present rut imports of United States lumber will hardly improve. Of course, no matter how stringent money matters are there is always a little development that seems absolutely necessary. For that reason the Prairie Provinces will import some lumber, but these imports will be small as compared with imports of last year. During September, 1913, a little less than 400,000 feet was imported.

Thus the decrease in exports of western pine to the Prairie Provinces of Canada is traceable to the war with the Balkan States.

Editorial Short Lengths for Busy Readers

Sir Wilfrid Laurier in a recent address expressed a conviction that within 25 years all the New England manufacturers of pulp and paper will transfer their works to the Valley crossed by the National Transcontinental Railway.

Prices which the B. C. Forestry Branch has obtained in the sale of three timber leases indicate that the policy of cruising all Crown lands on which merchantable timber is located is a wise one. A clear profit of \$8,000 was made recently. Some weeks ago three applications were received in which the standard price of \$5 per acre was offered, making an approximate total of \$4,000. After making a cruise the government obtained a price of over \$6,000, together with a royalty of 50 cents a thousand on all timber. In this sale the department got a record price for cedar in the north, namely, \$1.61 a thousand feet, standing.

The latest bulletin issued by the Census and Statistics office at Ottawa concerning field crops in Canada, covers the month ending September 30th. The bulletin states that the estimate of spring wheat is 188,468,000 bushels as compared with 182,840,000 bushels

last year. For fall wheat the estimate is 19,107,000 bushels as compared with 16,396,000 bushels last year. The total estimate of wheat production this year is 207,575,000 bushels as compared with 199,236,000 bushels last year, an increase of 8,339,000 bushels or $4\frac{1}{4}$ per cent. The yield per acre for all wheat is 21.15 bushels as compared with 20.42 bushels last year. Final estimates based on threshing results will be issued as usual on December 15th.

Before the Board of Railway Commissioners recently, complaint was made by the Canadian Lumbermen's Association, The Canadian Manufacturers' Association and the Toronto Board of Trade, regarding the cumbersome procedure adopted by Canadian railways in settling claims of shippers. Mr. T. Marshall, of the Toronto Board of Trade, stated that there were claims still unsettled which had been hanging fire since 1905. If freight agents would use a little more common sense and less red tape and rule, there would be fewer disputes. The Board of Railway Commissioners listened to the argument with interest, but announced that it had no jurisdiction to issue such an order as was requested. This was a matter to be settled in the civil courts.

The Development of Electric Logging

Practical Application of Electrically Operated Cables on the Skyline System—
Details of the Undertaking on a Large Operation

By E. J. Barry*

Loading Logs by Electricity—The Hoisting Gear.

Loading Logs by Electricity—The Drums and Motor.

In October of last year the Potlatch Lumber Company, of Elk River, Idaho, placed in service two electric logging engines, and from results obtained, it is confidently anticipated that these will prove the forerunners of many similar installations in all countries where logging operations are carried on.

Last month the writer was able to make a test on these machines, and the results are given in the hope that they may be of interest to lumbermen in general.

The logging engines were especially designed and built for electric drive by the Willamette Iron & Steel Works, Portland, Oregon, for use with what is known as the McFarlane skyline system. The McFarlane system is especially adapted for use in country where the logs have to be removed from steep hillsides. A 1½-inch steel cable is anchored to standing timber on the crest of the hill, the other being fastened to the hoisting drum of the donkey.

This cable may be carried out a distance of four thousand feet under favorable conditions, that is to anywhere the weight of the trailing log will not cause too great a sag.

A carrier or trolley attached to an endless line brings in the logs, clearing the entire hillside within the limits of its travel.

When one portion has been cleared the main cable is moved to a new location and so on until a radius of from 3,000 to 4,000 feet has been cleared of timber. The logging engine may remain in one place for two or three weeks, and thus save the expense of moving continually, which the older method of ground haulage involves. Also

the logs are in much better condition for the sawmill when they have not been hauled bodily over gravel and rocks. Pieces of gravel are embedded in the bark with disastrous results to the saws when they come in contact.

The skyline method permits of much faster handling as the logs, having only one end trailing, are not likely to encounter obstacles.

The electrical equipment of each machine consists of one 150 h.p. General Electric, Form M-550 volt, 600 r.p.m., 60-cycle, 3-phase wound secondary logging type motor, equipped with solenoid brake.

The motor is totally enclosed and of very rugged construction to withstand the exceedingly hard service the work involves. The control consists of a seven-point controller connected to a bank of resistance grids located in the rear of the skids on which the machine is mounted.

The controller also operates the primary circuit, making the drive self-contained.

As a safeguard a time element oil circuit breaker switch is also installed, together with an ammeter mounted in view of the operator, who is thus able to determine the safe stresses he can place on the steel cable. In practice it has been found that the cable is the weak link in the chain, the meter being able to take care of any and every load applied so far.

The brakes are operated by air from a Westinghouse compressor driven by a 7½ h.p. motor. Compressed air also operates the signal whistle, a very important feature of logging equipments as in most cases of long haulage the operator cannot see the load on starting, but

* Of the St. Paul & Tacoma Lumber Co., Tacoma, Wash.

Loading Logs by Electricity—The Log Carrier.

Loading Logs by Electricity—Transformer Car on Right.

must depend on signals given by the hook tender as to what he has to do.

Power is transmitted at 11,000 volts from the sawmill power plant located three and one-half miles from the present logging operations. A portable sub-station mounted on flat cars as shown in photographs step down the voltage to 600. Power is then supplied to the motors by triple conductor 000 cable steel armored and lead covered.

Expulsion fuses and horn gap arresters protect the primary side of the 200 kw. three-phase oil-cooled transformers.

The line construction has been made as simple as compatible with safety and inclusive of all charges, clearing right of way, material and labor, but cost of land not included, amounted to \$767 per mile.

The photographs show the general contour of the country in which these operations are being carried on and also why it is unnecessary to make frequent changes of locations for the logging engine. In photograph No. 1, the entire hillside has been cleared from the position shown.

The average daily haul for the month of April this year was 33,000 feet for No. 1 donkey, an excellent showing, everything considered. On May 13th, the machine under test brought in 55,000 feet of logs, establishing a record. When certain mechanical defects in the equipment have been rectified it is expected that this record will be exceeded.

The rate of travel of the trolley at present is 1,000 feet per minute hauling in an average load of 1,700 log feet. It is expected to increase this rate of travel to 1,200 feet per minute on the new carrier shortly to be placed in operation.

It is to be remembered that the white pine logs in this district are small compared to the fir and cedar of the Coast timber, where the distances hauled would have to be shortened considerably.

For the test a curve drawing wattmeter was used with an indicating wattmeter as check, an ammeter and voltmeter were used to check power factor.

Running out light the carrier showed an average power input of 84. Hauling in logs scaling 1,000 to 1,500 feet showed an average power input of 139 h.p.

Loading logs on cars averaged an input of 107 h.p. Power factor equalled 68 per cent. average.

A decided saving in time and power consumption would be effected by using a separate motor and light hoisting apparatus for loading and so permit loading and handling at the same time. At present the one hoist has to do duty for both operations for which it is not suited. A 50 h.p. meter would have ample capacity for loading logs either on rollways or cars.

The advantage of electric over steam haulage can be summed up briefly. No fuel required, with consequent wastage of good lumber averaging about 1,000 feet per day for each engine. Elimination of fire risk in the forest; power labor costs, no firemen or wood cutters required to supply fuel; no freezing of boiler tubes in winter and consequently no charge for night watchmen in cold weather; maintenance costs less than with steam; boilers have to be washed every two weeks and engines with reciprocating parts are harder on upkeep; no water required. This is often a serious item, it being necessary in many cases to pump water for a distance of two miles; no delays to get up steam and no shut-downs through failure of pressure, a frequent happening on very long hauls; no danger of boiler explosion; greater adaptability in regard to speeds which can be increased beyond standard engine speeds presently in use—this is an important point that will be recognized by all logging men, from the fact that the steam donkey is being built larger every year to give higher rotative speeds to increase the speed with which logs can be brought in. The speeds of reciprocating engines of the logging type appear to have reached a maximum owing to the great weight of the apparatus built to stand the racking strain which these speeds impose. On the other hand the speeds of motors are peculiarly adapted for fast work from the absence of reciprocating parts and adaptability for speed control.

Speed variation with efficiency is an essential feature for logging work. There are places where logs must come in at the utmost speed available and others where a slow pace is necessary. The electric motor of proper design fulfills these requirements more completely than any other mechanical appliance.

The output of each machine can be standardized readily.

The output of steam donkeys will vary in ratio to the attention paid to proper firing.

It is estimated that a saving of at least 50 cents per thousand would be effected.

During 1911 the St. Paul & Tacoma Lumber Company, between contracts and camps, hauled eighty-one million feet, log scale. On combined operations the gross saving would be \$40,500 from which the cost of energy would have to be deducted.

Our records average 10 kw. hour for each 1,000 feet logged. This varies somewhat but is sufficient for practical purposes. 810,000 kw.

hours per year at a rate of 1.5 cents, equals \$12,150. \$40,500 minus \$12,150 equals \$28,350, saving effected even at a minimum of 50 cents per thousand.

The saving in elimination of one of the gravest fire risks can hardly be estimated in dollars and cents, but would pay a heavy interest, no one can doubt.

British Columbia's Forestry Provisions Effective

The returns from the leases of Crown timber in British Columbia, as shown in statistics which were recently submitted by the Forestry Branch of the Provincial Government, show that the policy adopted in the management of the forest resources, is bringing in good results from the government's point of view. The chief forester, Mr. H. R. MacMillan, in a recent interview upon the subject, said: "During the last twelve months sixty sales of standing timber, involving over 300,000,000 feet, have been completed by the Forestry Branch, and the Department has on hand today sixty-five applications for consideration, covering a further 100,000,000 feet. The value of the timber sold amounts to approximately \$400,000, the price obtained by the department varying from one and a half to two and a half dollars per thousand. The policy adopted by the department of cruising the timber before offering it for sale, and having an expert investigation made of each lot in order to determine the upset price at which it shall be offered, has materially increased the revenue obtained from these lands. After the cruise is completed, an expert makes a careful estimate of the cost of operating, and of hauling to the ocean, adding the charges for towage and transportation to the markets. A fair profit is allowed for the lumberman, and the price per thousand feet based on the total cost of handling."

That this policy has eliminated speculation in timber lands to a great extent is clear from the fact that in not a single sale negotiated by the department has a transference of title been made or asked for by the original bidder. Under the old system of timber licenses, the only revenue obtained by the government was the royalty of fifty cents per thousand feet demanded under the law. This royalty still holds good, but, in addition to this amount, an additional charge of from one to two dollars per thousand has been added to the revenues of the province.

"The policy, although it follows the lines of the generally accepted modern idea of true conservation, is an entirely new one, and its success was considered problematical by opponents of the government. But if the proof of the pudding is in the eating, the Forestry Act has certainly justified its adoption.

"In order to hedge the timber speculator around with difficulties, the contracts drawn up by the Forestry Department stipulate that only a certain number of years shall be allowed for the purchaser to carry out his contract. The period varies according to the accessibility of the output, its size and other conditions, and generally is set at from one to two years, although in a few special cases the period of clearance has been extended to four years. The contracts are also framed to prevent waste and to further the benefits to the whole industry accruing from close utilization, and although no attempt has been made to interfere, within reasonable bounds, with the actual logging operations, a close watch is kept on the methods adopted by the contracting companies, and a campaign of education has been begun to instruct loggers as to the most economical method of getting timber out.

"The policy of the government is guided by a desire to promote the best interests of the lumber industry in the province, and at the same time, as the largest owner of stumpage in the world, British Columbia is naturally anxious to conserve her own interests and to increase her legitimate revenues. In almost every case, the timber offered and sold by the government has been adjoining areas where logging operations are already in progress, and these lands would not have been profitable for new companies to operate upon, so that the timber sold means so much clear revenue to the department, after deducting the costs of cruising and sale. The timber leases have also had a beneficial effect in stopping trespassing. During the past twelve months forty cases of trespassing have been brought to the attention of the department.

British Columbia Royalty Again Under Discussion

A despatch from Victoria, B.C., states that representatives of coast and mountain lumbermen associations and officials of the Forestry Department are considering proposals for a new royalty basis, which, if acceptable, will probably be put into force by legislation at the next session of the legislature. It is understood that the mountain lumbermen will abandon the Doyle scale and accept the B. C. scale, now used by coast interests; that the present royalty figure of 50c per thousand feet will continue until 1916, after which for ten years coast lumbermen will pay \$1 per thousand feet on No. 1 and No. 2 fir and spruce and No. 1 cedar and 50c on all other varieties of timber. Mountain lumbermen will pay 50c on all varieties.

Waste Reduction—The Problem of Today

How the Operation in a Softwood Mill May be Made Profitable—Products to be Manufactured out of the Waste

By Chas. Allen

TAKING up the waste reduction matter where we left it in the article in the issue of October 15th, we had reached the point of making a practical use of the small logs from a spruce operation of about three million feet. No doubt the simplicity of handling these logs as suggested, will cause many to think that, after all, there is not much to this waste matter, if that is all that is necessary to handle this thing profitably. That is just the point I want to bring out, its simplicity from a practical point of view, and the fact that waste saving is a straight business proposition. This problem is not dependent upon theory for its solution. We use every day great quantities of wood goods that should be made from these small logs. I have seen hemlock logs 12-in. on top, and up, being cut up into 2-in. x 3-in. and 2-in. x 4-in. at large expense for sawing. They were cut up into 2-in. by live gang, then run through the edger again and again until reduced to the size wanted. Nothing less than 10-in. top was hauled in the woods for this cut and I had the opportunity of examining the slash from that logging. Had it been taken down to 6-in. top, fully one hundred thousand feet additional would have been sawn at a smaller sawing cost into 2-in. x 3-in. and 2-in. x 4-in. than these large logs. Hence they would have given a larger profit per thousand feet than the large logs and would have reduced the average cost per thousand in the mill yard.

Waste in Conversion of Large Logs

How often have we all seen large logs being reduced to small sizes, while the tops of these same trees could have been handled at less cost into the same sizes? I do not understand why business men continue to let this thing go on and I hope that it will soon stop. There is no more reason why the valuable wood at the top of the tree should be thrown away than that the wood from the butt of the tree should be thrown away; in fact, less reason, as the tops admit of cheaper handling at the mills than do the butts.

I want to try and make this point strong before I pass it. All the wood that is in the tree can and should be saved. It is easily possible to do it. It pays to do it and it is simple of accomplishment. Any suggestion that calls for higher costs in manufacturing, great complications in the handling of the raw material, or large capital outlay in the equipment required to convert these small logs into a marketable product, is not in my opinion a real solution of the problem. On the other hand, it seems very difficult to get a manufacturer to take up these simple and saving plans.

The Problem for a Small Operator

In operations of the size we have been discussing, where the logs saved average only about three hundred thousand feet and a further saving of something less than that amount can be made from the waste at the mill, making a total saving of not more than five hundred thousand feet per year, it would be a hard matter to keep in your employ permanently, an expert man to follow this waste saving up, but the services of such a party for a month or two in one winter and something like the same period in the mill one summer during which time he would work out your problem for you and break in any regular men in handling your particular case, would cover the ground. You could then go ahead at no additional expense, and your men, now that their interest was aroused in waste saving, would no doubt find additional uses for this raw material. You would be surprised how many profitable uses for waste will present themselves to you, once you have made a start at saving.

The operations that need, and can easily afford, to keep an expert waste man, are the ones cutting from say eight millions of feet mixed varieties of timber and up per year. These operations usually cut a widely varying combination of logs of both soft and hard wood. There are as many combinations and proportions of different varieties of lumber as there are mills. Some cuts include white and red pine, spruce, hemlock and other kinds of soft wood, as well as birch, beech, maple, elm, ash and other hardwoods.

I am not going to try to lay out any line of procedure for such unknown quantities, as it would be simply impossible to convey any intelligent idea of the possibilities of such mixtures. These are the operations which need expert handling in the waste department and they should prove a "paradise" to the man who is interested in saving waste.

The Larger Operator's Saving

Take a twenty million feet cut of this class and figure that the woods saving would run from one and one-quarter to two million feet, and the mill saving in many cases fully one million feet more. Then

you get some idea of what chance there is in the waste saving department of such an operation. The total raw material available would be anything from two to three million feet. If your waste handling would turn but two dollars net per thousand feet, the net profits from waste on such an operation would run from four to six thousand dollars per year. Is it worth trying for or is it not?

Many owners and managers will look on the above statements and think that they are much overdrawn. I wish that I could believe they were. The fact of the matter is, that they are very conservative. Many concerns are throwing away much more profit than here stated.

"This three million feet saved from waste makes quite a respectable cut, does it not? Many people build fairly expensive mills to handle no more per year. Your possibilities for output in the softwoods from this class of stock (small logs and mill waste) include the following: scantling, crating pickets, staves, wainscoting, ceiling, laths, squares, box boards, boxes and many special things of local importance. The hardwoods will be taken up as a lot later. This list is far from complete. All the above commodities are in demand in the market by the millions of feet or pieces. They are now being put on the market, cut from the present stocks of logs, while the very logs that are best suited for this class of output are being rejected and left to rot. You are using your big and expensive machines to produce what you can make with small and inexpensive machines. The big mill cannot handle this small log and waste stocks with its heavy machines, so provision must be made to handle it, but that is not expensive if you have the power to spare from your present machines. If you have not the power to spare then it must be supplied.

The Layout of Equipment

The most satisfactory arrangement, provided there is not room in the present mill, is secured by an ell or extension. This extension would contain the machine to handle the waste and would, for a complete outfit, contain any one or all of the following machines, depending on what output would prove the most profitable at the several locations:—twin-slabber, edger, ricker, lath machine, shingle machine, stave machine, turning-lathe, heading rounder. Few mills would want all these machines but twin-slabber, edger, ricker, and lath machine are almost indispensable in the handling of small logs and mill waste. Most mills now have lath machines, but these machines usually have all they can handle from the "big mill," so it would be necessary to have another lath machine to work up the waste from the small logs.

The class of lath machine needed for this kind of work is the type generally used throughout the Maritime Provinces, a combination bolter (single) and lath machine. Gang bolters do not give the best satisfaction on this class of work.

All scantling would be made by the twin slabber, edger method. Crating, wainscoting (rough), pickets, box board, etc., by the ricker. All slabs would go to the lath machine. If you use the other machines, their names will tell you their uses, and if you want all the dollars out of your present waste you will use every one of these machines.

The mill waste that you will have a chance to save is in the form of slabs, edgings and trimmings, and the amount of saving you can make from it depends to a large extent on what class of goods you are cutting. If you saw spruce largely into deals your saving will be large. This statement holds true in the case of two-inch and dimension frames. If you saw into inch boards, you have a poor show for a large saving. Most mills saw a variety of tops into all kinds of stock from one inch up in thickness, so, taking things all round, there is a great chance for waste products.

Most mills put their slabs and edgings into lath but there is a big loss from these, as there are so many choice pieces less than four feet long thrown away. These pieces should go to the ricker and be cut into crating and box stock. If large and of white pine, they should go to the shingle machine.

The Resaw a Gay Deceiver

You must also look out for this resaw business on your slabs. Many times you rescue a spruce board say 12 feet long and 6 inches wide containing six feet, worth twelve dollars per thousand, leaving that particular board worth 7.2 cents, while, if you had sent the whole slab to the lath machine you would have got from 36 to 42 more lath from it than you did get, and if lath are worth anywhere from \$2.50 to \$3 per thousand you just dropped anywhere from two and one-half cents to six cents on that board. You just keep your eye on that re-

saw. It looks very nice and innocent, running along with other machines, but is a gay deceiver. It has its uses and its place, but is by no means all it pretends to be.

It is just as much a waste to reduce the selling value of a piece of wood as it is to throw away a piece of wood that has some value.

The chief product from your edgings must be lath, in softwoods. The pieces not four feet long will, in the case of deals, make 3-ft. pickets or 2-ft. crating; if 2-in. thick, crating only; if 1-in., not much of anything.

Shingles Produced from Trimmings

Trimmings in all the thicknesses down to 3-in., produce large quantities of shingles. These shingles may not be of high grade, but they should not cost you, bunched and piled, more than sixty cents per thousand. They make a good shingle for side walls and will turn a good profit almost anywhere. You can make a lot of barrel headings from trimmings on the shingle machine from all thicknesses of stock. As a matter of fact you can make so many things from this mill waste, if you go at it, that it will surprise you. I have noted an average of fifteen thousand shingles to each one hundred thousand feet of pine and spruce that was being sawn into deals, planks and scantling. The market at that point paid \$1.50 per thousand at the mill and the shingles there cost 50c per M. to saw, bunch, and pile, leaving a clear profit of \$15 per hundred thousand feet sawn from the trimmings alone.

This mill cut no headings, but had they done so there would have been a still larger profit from these trimmings. You can also get a lot of small boxes from softwood trimmings if you resaw them. I fully believe that a large percentage of all the boxes used could be made from the waste now burned at large mills.

Selling Special Pieces to Factories

The things discussed as being made from the slabs, edgings and trimmings are only a few of the many uses this waste could be put to. In every locality there are factories using small pieces of wood for all kinds of purposes. They usually buy certain dimension stock and cut it up themselves at more or less waste to them. In almost every case they would buy these small pieces cut to size, provided the parties supplying them would see to it that these small pieces were accurately cut. This would simplify things for them (the factories) and give the mill men, who have the small pieces in the form of waste, a chance to turn this waste into money. The mill man may argue that this factory has to buy its supply of wood from him anyway so why bother to cut it up for the said factory?

This is not the point. All the stock so sold to the factory calls for stumpage, while the small pieces cut out from the waste are part of the stumpage already used up. If the small pieces can be supplied at even a less profit than regular stock, it is really paying the lumberman better, as this stock has no charge against it for logging and stumpage.

A Saving of From Four to Six Per Cent.

The only cost against any output from what is now mill waste, is the actual labor involved in its rescue from that waste. Like the small log from the top, it carries no overhead charge except the interest on the money invested in the machines that produce the output and the depreciation on these machines.

When you figure on anything from waste remember the raw material costs you but little or nothing. As a matter of fact, this raw material from the mill (waste) is now a source of expense to you. You are not going to get rid of all the expense of disposing of your waste, but you are going to cut down the quantity quite a lot, which should make some saving in the destruction of it.

Like the small log, the mill waste output is going to pay you a larger profit per thousand than your regular stock.

If you make pickets, crating, box stock, heading, or shingles from your mill waste (after you have saved as many laths as possible) you will add to the output from your stumpage from four to six per cent. (without counting in the lath). This would be a clear pickup of from 400,000 to 600,000 feet in a cut of ten millions and you can easily make this "pick up" pay handsomely.

Foreign Pulp Coming to Canada

Lately there have been considerable importations of wood pulp from Norway into Canada, for the purpose of being manufactured into paper which is exported to the United States. The pulp can be laid down here at a cheaper rate than it can be manufactured in Canadian mills, owing to the smaller capital cost of the Norwegian mills—in some cases 50 per cent. lower—the use of sulphur pyrites, obtainable at cheap rates, in place of the pure sulphur used by Canadian mills, and also, in certain instances, owing to the dumping of pulp at rates less than the cost of manufacture.

The chief objection on the part of those interested in the Canadian pulp industry is to the clause in the Canadian customs laws which allows a drawback of 99 per cent. of the duty on imported

pulp, provided that the paper made therefrom is exported. Some of the importers are American capitalists owning Canadian mills, and it is argued that it is unfair to Canadian makers of pulp to allow foreign competition under such conditions as will give undue advantages to rival makers. It is not to be expected that Canadians will embark additional capital in pulp enterprises when faced by circumstances which allow practically a free entry of the goods into this country.

Ontario Government Sells Timber Limits

The Ontario Government recently advertised for tenders for the right to obtain licenses to cut the red and white pine timber on a number of berths in the townships of Thistle and McWilliams in the district of Nipissing. Tenders were received up to the 30th of October. Following are the names of the successful tenderers together with the amounts paid for the different townships:—

Berth No. 1 Thistle, H. H. Hettler & Company, Chicago, Ill., \$12,000.

Berth No. 2 Thistle, Geo. Gordon & Company, Limited, Cache Bay, Ont., \$6,000.

Berth No. 3, Thistle, H. H. Hettler & Company, Chicago, Ill., \$32,000.

Berth No. 4, Thistle, Georgian Bay Lumber Company, Waubashene, Ont., \$18,250.

Berth No. 1, McWilliams, Georgian Bay Lumber Company, Waubashene, Ont., \$14,250.

Berth No. 2, McWilliams, Geo. Gordon & Company, Limited, Cache Bay, Ont., \$10,000.

Berth No. 3, McWilliams, Geo. Gordon & Company, Limited, Cache Bay, Ont., \$51,000.

Berth No. 4, McWilliams, Geo. Gordon & Company, Limited, Cache Bay, Ont., \$4,000.

The above prices are in addition to the Crown dues of \$5 per thousand feet and the ground rent of \$10 per square mile.

St. Lawrence Company Constructing Plants

The St. Lawrence Pulp and Lumber Corporation are constructing rolling mills. The sawmill will be in operation early in the spring. A townsite is being laid out and a standard gauge railway is also being built. The company purchased the timber limits of the old Pabos Lumber Company, in the Gaspé Peninsula and Bonaventure, P.Q., and the line now under construction will enable the lumber to be transported from the limits of the mills. The main line runs from the mill site at Pabos Mills to the limits, and on this road engines of special design will be used. From the main line, branches will be constructed, as required, down the various gullies to the lumber camps. On these branch lines, engines of a different type from those in use on the main line will be employed. They are specially constructed for climbing heavy grades, the drivers and tender wheels on one side being geared to a longitudinal shafting.

The main line is now built a distance of four miles, and is connected with a branch to the first lumber camp. Cutting will proceed throughout the winter at this camp, the lumber being transported to the mill by train.

There is a lack of stream flow in the Gaspé Peninsula, and for this reason driving of logs has not been very successful, operations having been confined to a few of the larger streams, leaving considerable areas of spruce, balsam, birch and cedar untouched so far as lumbering is concerned. It was for this reason that the railway lines referred to were designed.

During the summer shipments can be made by water from a deep water wharf at Pabos mills, while the mills have also railway sidings connecting with the Atlantic, Quebec and Western Railway. Mr. W. H. Racey, formerly of Price Brothers, is the general manager.

New York State Regulates Shingle Counting

Montreal, November 6:—The Department of Weights and Measures of New York has adopted the following regulation with regard to shingles, which will come into force on February 1, 1914:—"Shingles shall be sold by numerical count. For the purpose of representation, random width shingles when packed in regulation frames 20-in. in width, and when packed 25 courses at each end, four such bundles shall constitute a thousand, and when packed twenty courses at each end five such bundles shall constitute a thousand. Openings in bundles shall not average more than 1½ inches to the course. A variation of one inch in length shall be allowed in 10 per cent. of the shingles in a bundle. Marking may be done on the bundle or else a representation made on a sales slip, ticket, or tag accompanying the bundle."

The object of this regulation is to protect buyers in New York State.

The Reader's Viewpoint on Trade Topics

Opinions on Questions of General Interest—Reducing Logging Waste—The Panama Canal's Probable Effect on the Lumber Trade

Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few that have been received lately:—

A Practical Application of Mr. Allen's Proposals

Editor Canada Lumberman: Fredericton, N.B., Nov. 1st.

I have read Mr. Allen's able articles in your two editions of October 1st and 15th and quite agree with all he says regarding waste in logging operations. To get the top out of the woods is something many of us have been striving after, for a great number of years. The Timber Regulations of this Department for some time have contained a provision that all logs must be taken out up to 5 inches in diameter, and, while I do not claim that it is wholly carried out in practice, our lumber operators are gradually seeing that an era has arrived when less wasteful methods must be followed to get the true value from our forests.

Mr. Allen in his two articles has not touched upon the more important aspect in the removal of the tops, viz., the lessening of the fire danger. I am quite convinced that, if the land owner were to allow the operator to remove these tops without stumpage cost, with a further provision that the crowns of the trees should have their under branches lopped off, it would, to a large extent, minimize the fire danger, and be a tremendous advantage to our forests.

I also quite agree with what Mr. Allen says about more forest supervision in the actual work of lumbering. These matters have been repeatedly advocated at meetings of the Canadian Forestry Association and the time is assuredly coming when wasteful methods such as he speaks of will be, to a large extent, if not altogether, eliminated from forest operations.

I will say for Mr. Allen's information that I have leased some lands of my own for a considerable spruce operation which required the log-getter, not only to pay the same stumpage for the tops as for the merchantable, but to remove everything up to five inches and to underlop all the crowns. All trees are sawn down at the swell of the roots and sawn up into lengths. I have placed competent overseers to see that the conditions are carried out and I expect to have good results. Ten years ago I would have been laughed at, were I to have exacted these conditions.

I am sorry I cannot agree with Mr. Allen in his statement that after virgin growth is cut away, quite as good never follows. This statement is something new to us, and upsets the principles of nature. If one were to follow this reasoning, as well might he say that when you break up land and sow it to wheat, you will never have so good a crop as the first one. My theory is in lumbering: remove the merchantable log at maturity; let in the air and light, and the same process will rotate, resulting in a bountiful nature supplying as good a log as the virgin one that was cut away.—T. G. Loggie.

The Panama Canal's Effect on Lumber Trade

Editor Canada Lumberman: Peterborough, October 27th.

The opening of the Panama Canal this year marks a more important epoch in the history of the western part of this continent than the discovery of gold in California in 1849. It brings at once our western Pacific slope and its products nearly one-third of the circumference of the earth nearer to the great markets of the United States and Europe, and at the same time, brings the Pacific slope the same distance nearer to the great bases of supplies of all the necessities of life and of every conceivable form of manufactured goods, without having to pay the toll of exorbitant freight rates to obtain them.

Take as an instance the effect of the operation of the Panama Canal on the forests of British Columbia. Today it costs 75c per hundred pounds in freight rates to transport by rail, timber and lumber from the western coast to the eastern coast, which is equivalent to an average toll of \$22.50 per thousand feet, but, when the Panama Canal gets in full operation, this freight toll will be reduced below 30c per hundred pounds and will effect a saving in freight rates on timber and lumber between these same shipping points of over \$13.50 per thousand feet.

A part of this saving will be absorbed by the eastern consumer, much by the British Columbia lumber manufacturer and more by the owner of British Columbia standing timber. The full operation of

the canal will do more. It will open up, in the great populous centres of the United States and Europe, a wider and more constant and profitable market to the lumber manufacturer of British Columbia, and will eliminate many of the present risks and dangers of having to sell his product almost solely in the unstable and easily congested market in the western provinces. The British Columbia logger will have a more certain and uniform market for his logs. The manufacturer will be enabled to bring up the production of his plant to its fullest capacity and at the least minimum cost.

There is no question that vessels from the Pacific coast heading for the Atlantic via the Panama Canal will be laden, under normal conditions, to their fullest capacity with the products of the forest and the mines and the fertile lands of the western portion of this continent. These resources on the Pacific and the demand for them on both sides of the Atlantic amply justify this assertion. The very fact that Seattle under past adverse conditions holds the second place among the seaports of the United States in shipping tonnage, also supports this assertion. But the question arises will these same vessels have to return for a new cargo laden with unprofitable ballast? It would be strange and unnatural if that were the case. The most obvious answer is "no." These vessels will return laden from the east with manufactured goods, wares and merchandise of all kinds, in such quantities as will effectually reduce the high cost of living on the Pacific coast and will furnish thousands of workmen and their families, living in populous centres on both sides of the Atlantic, cheap transportation via the Panama Canal to Pacific seaports where employment will be certain and the cost of living under new conditions will be moderate. R. R. Hall.

The Cost of Forest Surveys

The Canada Lumberman:—Dear Sirs:—Feeling that you care to assume some responsibility for the truth of your advertisements, I take the liberty of calling your attention to the phrasing of one in a recent number of the Lumberman. A forestry concern states that it carries on forest surveys, cruising and examination and that "absolutely accurate results may be obtained at a cost varying from less than one cent to about four cents an acre." The context of the advertisement would show that this means in the estimating of timber and mapping of lands.

Such phraseology is not consistent with truth. As a rule only the most casual examination of land can be made for one cent per acre; "absolutely accurate" is so strong a term that I doubt if it can ever be obtained in timber estimating, as, outside of the careful measurements, the element of discount for hidden defects must always be had.

Analyzing the estimating force, and putting this cost as low as it can be had for experienced men, we have a statement for per diem expenses as follows:

Cruiser, \$3.00; Assistant, \$1.00; board, \$1.00; total \$5.00.

This allows no travel or incidental expenses, but I wish to place my figures so low as to be beyond criticism. At one cent per acre, this force must cover 500 acres; at four cents per acre it must cover 125 acres. It will not be possible for it to count the trees, (much less to measure them) on more than 30 or 40 acres per day, and in my own experience from 12 to 20 acres is more in keeping with a normal day's work. "Absolute accuracy" cannot be had on a percentage count on areas; it cannot even be had if every tree on the tract is counted. When you consider that under ordinary conditions, where travel, lost time, figuring, extra help, outfit, etc., must be taken into account the cost of such a crew will surely be at least \$10 per day, and the claim of "absolute accuracy" at one cent to four cents becomes even more absurd.

I wish you to consider this letter an open one for your columns and a protest against the too vigorous claims which are being made by some of the engineering and forestry concerns in America, and which too often leads to employment under false hopes of results to be gained. Accuracy in timber estimating can be had, but it is not "absolute accuracy," nor can it be obtained at so low a cost as this advertisement claims. As a matter of fact in actual work which I have done during the past few years, the price of four cents per acre for timber estimating alone, will not allow much more than 2½ per cent. of the area to be actually measured and counted. I certainly should not claim "absolute accuracy" where so small a percentage is covered. That such claims as this mentioned above are to a high degree unfair, and unprofessional also, is my opinion. Yours very truly, James W. Sewall, Old Town, Maine, November 4th.

Mixed Trade Conditions in Eastern States

Editor Canada Lumberman:—

Boston, Mass., Oct. 30th.

In the general lumber market in New England and New York State, conditions seem to be somewhat mixed. We have had a great deal of very bad weather here lately, which has slowed up the retail trade greatly. Also, financial conditions have been such that it has been very difficult to obtain money on mortgages. This has stopped most of the speculative building, or at least, has greatly slowed it down, and has curtailed the lumber business considerably, so that the market is generally rather weak and uncertain in price. Spruce has been weakening somewhat lately and shingles have been weak. We would say that the average price of spruce timber has dropped 50c. in the last two weeks. On the other hand, the eastern mills are beginning to get sawed out and getting ready to shut down, so, if the weather should continue warm we may possibly have some improvement, or at least, have a steady market on spruce for the balance of the year.

It is our opinion that financial conditions will be much better another year. Business is slowing down all around and we think a great many people are restricting their operations to some extent, so they will not require as much money. We look for a more plentiful supply. There seems to be a good deal of uncertainty about the new banking and currency bill, and a great deal may depend on the final outcome of this measure. Personally the writer is of opinion that some fair sort of measure will be worked out, which will put our finances in a somewhat better condition. The bankers are nearly all pessimistic and talk as though things would be left worse off than they are now when the new bill is passed.

All of the retail trade is pursuing a hand-to-mouth policy, buying nothing unless they need it, and generally wanting what they do buy in a hurry. Still there is a considerable volume of business moving at an unsatisfactory profit. Low grade southern pine and Carolina pine have been selling at the lowest notch for a number of years and there seems to be no indication of improvement. In fact, if anything, they have been a trifle easier in the last two weeks than they were previously. On the other hand, low grade white pine seems to be pretty well cleaned up, and we think in the Canadian market, and in the west, there is very little surplus. In fact there is an actual shortage in many kinds of No. 3 barn bds and poorer, particularly in box and mill culls, so that it appears to be quite firm at present. Some people are making contracts ahead to be sure of a supply.

Shepard & Morse Lumber Company.

The Disappearance of "Batiste"

Editor Canada Lumberman:—

North Bangor, N.Y., Nov. 1st.

As wood operations are in full blast throughout the northeastern States and Canada, I would like to make a few remarks through the columns of your paper. The problem of obtaining skilled labor for the bush is a serious one, under existing conditions. In years past, here in the Adirondacks, the personnel of the camps was composed mostly of French Canadians, with a mixture of native stock. Times have changed. Where is our friend "Batiste?" The man who could make his axe bite far into the wood with an eager stroke—he of the big peavey, strong of limb and sound of wind. He is no longer in evidence, "Gone like the leaves of the forest when the chilly blasts of October seize and whirl them aloft and scatter them far o'er the ocean." "Batiste" used to come up the tote road with a bag filled with Canadian woolens—a generous supply of socks and mitts, the kind that Mother used to knit, usually his mind made up for a big stake. Well, good-bye "Batiste," you were a good man and we miss you.

The forgoing does not necessarily mean that there are no French Canadians here. It simply means there are, comparatively speaking, only a small number to what there were in former years.

Similar conditions obtain in Northern Ontario. If we were to step into the average logging camp in the above region today, we would find a mixture of tongues—Pollocks, Hungarians, our Canadian friend with his rich colonial accent—our friend "Batiste," is also here. Our friends from Continental Europe keep by themselves. "For East was East and West was West, and ne'er the twain will meet." Perhaps these men will, eventually, be more profitable than the short-stop, or the native with his mind made up for a prospective spree.

Geo. B. Oberton.

At Quebec, the Public Utilities Commission have investigated a complaint of the Chicoutimi Pulp Company against the Lake St. John Railway Company for charging \$2 instead of \$1 for demurrage, which is alleged to be exorbitant. The railway company contended it was a fair charge. It was allowed, the company said, by the Railway Commission on Federal railways in Canada. The company cited the fact that many consignees whose warehouses were full, often found it cheaper to leave the goods in the cars and pay \$1 per day for the same.

The Purpose of the Forest Products Laboratories

Montreal, November 6:—A start has been made with the Forest Products Laboratories established by the government at McGill University, Montreal, under the charge of Mr. A. G. McIntyre. They constitute a branch of the Forestry Section of the Department of the Interior, and are intended to conduct scientific investigations which will assist the movement for forest conservation, particularly in the matter of preventing waste and of utilizing lumber which is now regarded as of little or no value.

The purpose of the laboratories may be thus set forth:

1. To secure authoritative information on the characteristic mechanical and physical properties of commercial woods and products secured from them.

2. To study and develop the fundamental principles underlying the preservative treatment of wood, its use for the production of more products.

3. To develop practical ways and means of using wood which, under present conditions is being wasted.

4. To serve as a public bureau of information on the properties and utilization of forest products.

5. To co-operate with consumers of forest products in improving present methods of use.

The work carried on at the Forest Products Laboratories leads to a better utilization of our forest resources, viz.:

1st—Finding more efficient methods of manufacture of woods.

2nd—The elimination or utilization of the wastes of manufacturing and logging.

3rd—Finding use for woods not now commercially useful from a study of their mechanical and physical properties.

4th—Finding better use for woods now used to make the lower grade commodities.

5th—Looking for Canadian woods to substitute for imported woods either in their natural state or after treatment.

6th—Studying and developing the fundamental principles underlying the treatment of wood in its use in the manufacture of fibre products—alcohol, turpentine, resin, tar, etc.

7th—Serving as a public bureau of information on the properties and utilization of forest products.

8th—Co-operating with consumers of forest products in improving present methods of use and formulating specifications and grading rules for commercial woods, materials secured from them (such as gums, ails, resin, etc.), and materials used in the treatment of wood (creosote, zinc chloride and other preservatives).

The work of the Forest Products Laboratories will be divided into the following subdivisions:—

1st.—Pulp and Paper.

2nd.—Wood preservation.

3rd.—Timber Tests of the Mechanical Properties.

4th.—Wood Distillation.

5th.—Timber Physics.

6th.—Chemistry of Woods and Wood Products.

7th.—Pathology and Agencies Destructive to Wood.

The office of the laboratories has been opened in the old Medical building at McGill. The timber tests of the mechanical properties will be made in the Engineering Building, strength of materials laboratories. The engineer in charge is Mr. Russell W. Stearn, B.A., B.Sc. An order has been placed with the Tinius Olsen Testing Machine Company, Philadelphia, for a 30,000 pound three screw universal testing machine which will be used to test for tensile strength, compression, cleavage and for other standard tests of mechanical properties. An order has also been placed with the same company for an impact testing machine, which will test the resistance of wood to shock.

The department of timber physics will be in charge of Mr. W. Boyd Campbell, B.Sc., McGill. This department will study the seasoning and drying properties of Canadian woods, their physical and microscopic structure, and the identification of all Canadian woods by their fibre structure.

The appropriations for next year for the Canadian Laboratories are now before the government and it is expected that the three departments of timber physics, timber tests, and pulp and paper will be in full operation next summer, with a total staff of thirty. It is also probable that the following year there will be a department of wood preservation. There is, further, a proposal for the government to erect a separate building on the McGill grounds to be entirely devoted to the investigation of forest production.

Mr. McIntyre has returned from a three months' visit to the United States Forest Products Laboratories, Madison, Wis. He also paid a visit to Washington, New York and Boston, visiting the laboratories of the United States Government, Bureau of Standards, and the pulp and paper laboratories of Arthur D. Little, Boston. The United States laboratories spend annually about \$125,000 in testing forest products and employ a staff of eighty people, of whom one-half are experts in their various lines.

Boiler Explosions—What They Teach

Importance of Competent Inspection and Insurance
Demonstrated by a Recent Sawmill Fatality

One of the most important matters which a lumber manufacturer has to consider is the safety of his employees. Of late years many improvements have been invented which make it possible for him to be much more certain than in former times, that accidents will not happen in his plant. One development, not an invention perhaps, but of just as great importance to the lumber industry as many great inventions have been, is the development of the boiler inspection and insurance business. It is possible to-day, by taking advantage of the services of companies which make a business of inspecting and insuring boilers, to be very certain that a boiler is being operated under safe conditions. Yet accidents, or rather catastrophes, will happen. It is of the greatest importance, therefore, that all who have to use so dangerous a contrivance as a boiler should see to it that, so far as they are able to know, it is being safely operated, and that the man in charge is thoroughly capable. To do this, the most reliable method is undoubtedly to employ the services of a company which inspects boilers, making sure that the company's standing and reputation as mechanical engineers is such as will afford a guarantee of efficient inspection.

In the lumber manufacturing industry there are probably many old iron boilers in use which were constructed many years ago and require much more careful attention than modern boilers. Every once in a while we hear of such boilers exploding, causing great damage, and sometimes loss of life. A case occurred recently in a lumber manufacturing plant which affords a cogent illustration of the two-fold advantage of boiler inspection and insurance. The property loss in this case was between \$15,000 and \$20,000. Business operations were stopped, two men were killed and two were seriously injured. We are informed that this boiler was being operated at a pressure considerably in excess of the pressure at which it should have been worked, and reliable, if not expert, evidence was given at the inquest following the disaster, to show that the cause of the explosion was over pressure. While the boiler, as far as can be learned, was not insured, and therefore presumably, not under regular inspection, no one thinks for a moment that the owner did not feel satisfied that the pressure at which it was being operated was well within the limit of safety. If the boiler had however been under competent inspection it is safe to assume that the first information regarding his boiler that the owner would have had would have been a reliable report as to the pressure which he would be safe in using. The use of a boiler under any circumstances ought to place upon the owner the responsibility of adopting every reasonable means of insuring himself of its safety. This is a moral responsibility which he should be ready to accept and act upon. The best method of doing so and a method that is almost universally recognized would be to have the boiler inspected and insured.

We are informed also that the boiler under consideration was not less than thirty years old and that the pressure at which it was being operated was probably twenty-five or thirty pounds per square inch in excess of the pressure it was fit for. If these facts are correct, it is perfectly clear that competent inspection would have exposed its weakness.

This instance, and others, make it important to call attention to the matter in these columns. It is altogether probable that there are other boilers of similar construction in operation in this country to-day. The owners of such boilers should take to heart the lesson of this particular case and do all in their power to prevent the occurrence of such a disaster to their own boilers, at the same time securing the means of reimbursing themselves for any loss which they may be called upon to meet, should necessity arise.

We hold no particular brief for boiler insurance companies. We do feel, however, that these companies, when properly managed, are of great service to the boiler owner. This class of business is being carried on in Canada by several companies. The essential feature of the business is periodical inspection, the chief object of which is to prevent boiler explosions and attain efficiency in the operation of the steam plant. Its secondary feature is insurance, which stands ready to indemnify the steam user for such loss as adequate inspection has been unable to prevent. The business is by no means new, a very large number of steam boilers being under inspection, and insurance against the loss resulting from boiler explosions carried by the owners thereof. This would scarcely be the case if the value of the benefits derived therefrom did not exceed the cost of inspection and insurance.

The great majority of boiler users undoubtedly appreciate the benefits derived from competent and efficient inspection services. They recognize that such services, if thorough in every respect, minimize the possibility of explosion, that they prevent waste in the cost of

operation and maintenance and that they ensure the efficiency of the entire steam plant.

As inspections vary, the boiler user should satisfy himself as to the quality of the inspection services he is likely to receive before contracting for them. He should keep in mind the fact that, to attain the results he desires, a thorough practical and expert knowledge of steam engineering in all its branches must be possessed by the company rendering the services. This knowledge must embrace the design of steam boilers, their construction, the safe working strain that may be put upon them, and their installation and operation. The greater the knowledge and the longer the experience on which that knowledge is founded, the greater will be the results attained by, and the benefits derived from, the inspection services.

While very many explosions are and can be prevented, there are many that cannot, for the reason that no inspection services, however, perfect, can overcome carelessness or lack of knowledge on the part of the boiler attendant, or undiscoverable faults, or defects in material or construction. This has brought about the necessity of combining "insurance" with "inspection," the former being the supplement of the latter, its use being contingent upon the failure of the inspections to prevent an explosion. Until an explosion does happen the insurance has no actual present value.

The combination however, may be said to afford as complete protection to those operating steam plants as it is possible to obtain, and for this reason every steam user should carry an adequate amount of insurance. By "adequate" is meant a sum that will be sufficient to reimburse him in full for the direct losses that may result from an explosion of his boiler. The possible extent of these losses is only limited by the value of the destructible property within a radius that can be affected by the force or energy released by the explosion. The carrying of an inadequate amount of insurance means that the boiler owner is carrying a certain portion of the risk himself.

A Possible Market for Canadian Poplar

The Canadian Trade Commissioner at London, Eng., in a recent report says:—"One of the largest London firms in the box shook trade who, among other connections, do a big business in India and Ceylon with users of tea chests, hold the view that Canadian poplar is well suited for this purpose and that a large trade can be done provided that satisfactory arrangements can be made for the shipment of regular supplies upon a competitive basis.

"While veneer chests are preferable where a long transportation is necessary, many of the growers possessing easier shipping facilities use ordinary boxes manufactured largely from Baltic woods, but owing to the prevailing smell of the Swedish fir and the occasional presence of gum, this variety of timber is far from suitable for the purpose. For this reason it is thought that poplar wood free from such disadvantages, is in many respects an ideal material for the construction of tea chests.

"The same firm further considers that poplar would be preferred to Swedish fir for butter boxes, of which they also handle large quantities, because in this case again the contents are apt to be impregnated by the smell of the wood and suffer accordingly.

"In latter years there has been a great falling off in the export of box boards, etc., from Canada to the United Kingdom, due partly to the development of the wood pulp industry and also to the heavy demand existing in the Dominion for practically all varieties of manufactures of wood. For this reason the prospective business may not appeal to the majority of woodworking factories, but as the adoption of up-to-date appliances admits of a considerable proportion of otherwise waste material being utilized, some of the mills who have a large output capacity and are well located for obtaining cheap ocean transportation may like to take up the matter with the London firm interested."

Donnacona Paper Company Will Soon Start Operations

The Donnacona Paper Company, Jacques Cartier, P.Q., expect to start operations in their mill early in January, making fifty tons of newsprint and eighty tons of ground wood per day. The plant is a very complete one, and is under the management of Mr. G. M. McKee, formerly of Hincksley, New York.

Hon. Robert Rogers, Minister of Public Works, recently announced that he had inserted a clause in the contract for the improvement of Toronto Harbor, which provided that all the timber and lumber used on the work shall be produced by Canadian mills. The clause states that the timber and lumber shall be of Canadian origin, provided that the contractor is able to obtain it of the quality, in the quantity and at the times required for the proper carrying out of the contract and at reasonable prices. Failing this the Minister will have the right to permit the contractor to purchase the timber elsewhere.

The Endurance of Railroad Timbers

Valuable Report Presented by Special Committee of
American Railway and Bridge Association

At the annual convention of the American Railway and Bridge Association, held recently in Montreal, an interesting report was presented by a committee appointed to consider the preservation of timber. The report is quite extensive so that we are not able to reproduce it in full. We give however, the following interesting extracts.

"The life of timber varies with climatic conditions and also with the properties of the soil; therefore no accurate length of life can be given which will apply to the country as a whole, but we believe it to average about as follows:—

Variety	Length of life (years)	
	In contact with soil	In air
Cedar	20	..
Chestnut	12	..
Cypress	20	20
White oak	10 or 15	15
Long leaf pine	10	12
Norway pine	6	10
White pine	7	10
Spruce	7	10
Tamarack	8	10
Douglas fir	8	16

"In some localities timber will not last as long as this, and in others it will last a great deal longer. In the interior valleys of California and parts of Arizona and New Mexico timber has a much greater life, especially when not in contact with the soil, trestle decks of Douglas Fir 25 years old being common, and some as old as 30 years having very little decay.

"Long leaf pine and Douglas fir are the best varieties for structural work and have a fairly long life when not in contact with the soil. On the other hand, cedar, cypress and redwood have a fairly long life in contact with the soil but are useless for beams, etc., as they are too weak and brittle. White oak perhaps is the best all around timber, being durable both in the air and when in contact with the soil, but there is not a sufficient supply to permit of its use for structural purposes and it has more value for other uses.

"The Southern Pacific Railway has in place, in trestles, about 105,000 creosoted Douglas fir piles, treated by the boiling process ranging in age from one to 23 years with probably more than two-thirds of them over 12 years old. Of this great number not more than 500 have ever been replaced on account of decay and many of these piles 20 or more years old are as good as when driven. There is no doubt but these piles will be good for 30 years at least. The same timber would not have lasted eight years untreated. The number of decayed piles shown above is estimated and is considered to be above, rather than below, the actual number.

If these piles were all 40 ft. long let us see if it paid to use them.

An untreated pile costs	
40 ft. pile at 10 cts.	\$ 4.00
To drive, \$6.00	6.00
	<hr/>
	\$10.00

If it lasts 8 years, cost per year = \$1.55.

A creosoted pile costs,	
40 ft. at 30 cts.	\$12.00
To drive, \$6.00	6.00
	<hr/>
	\$18.00

If it lasts 30 years, cost per year	\$ 1.17
Cost untreated for 30 years	46.50
Cost treated for 30 years	35.10
105,000 piles at \$46.50 (untreated)	\$4,882,500
105,000 piles at \$35.10 (treated)	3,685,500
	<hr/>
Saving	\$1,177,000

or nearly \$40,000 per year.

"This same company has in service quite a number of untreated cedar piles that are twenty years old and are still sound. These piles cost about 15 cents per foot and the driving costs about the same, making the total cost 30 cents per foot. If they are good for twenty-five years they will cost 2.13 cents per year and if good for thirty years, 1.95 cents per foot per year. Creosoted, they would cost 50 cents per foot driven and would have to last about 45 to 60 years to equal the cost of the cedar untreated.

"The use of timber for cross ties has been one of the heaviest drains on the forest supply and there is no doubt but it will continue to be so while we have any timber left. It is true that the average

price of ties has not gone up as much as was predicted a few years ago, but it is also true that the quality is not so good and there is a greater cut of the softer and poorer woods. Hundreds of patents for concrete ties have been taken out but it is doubtful if any of them are satisfactory, and it does not appear that the time is ripe for them. Steel ties are proving satisfactory in service, excepting that they are hard to keep insulated; but they are too expensive to compete with wooden ties at present prices. The question of tie supply has not yet reached a critical stage and, with the present tendency toward the use of preservatives it is doubtful if the time will ever come when timber will not be available for cross ties.

"Cross ties fail from two causes, mechanical wear and decay, each of which has a great bearing on the other. The tendency at present seems to be to try to preserve a tie long enough to have it wear out before getting so badly decayed as to be unserviceable. It is probable that, with the usual track fastenings, a tie would wear out in about 20 years so as to be no longer fit for use even if perfectly sound; this applies particularly to heavy traffic lines. On light traffic lines, ties would probably last 50 years, except for decay. Instances are shown of cedar and redwood ties being in use 30 years or more, from which it would appear that a great deal can be done to preserve track ties by using improved fastenings, especially on heavy traffic lines. Tie plates are already coming into general use even with hardwood ties and they have proven to be money well invested.

"About one-quarter of all ties now used are treated with preservatives. In 1911, out of 135,000,000 purchased, 31,000,000 were treated as follows:

Creosote	17,600,000
Zinc chloride	8,600,000
Creosote and zinc chloride	3,000,000
Miscellaneous	1,800,000

A Valuable Book Upon Logging

One of the most interesting publications which we have had the good fortune to receive is a recent book entitled "Logging," by Ralph Clement Bryant, F. E., M. A., Manufacturers' Association, Professor of Lumbering at Yale University. The book, which is published by John Wiley & Sons, New York and Chapman & Hall, Limited, London, England, is splendidly gotten up, on a high class of paper, with excellent type and a large number of good illustrations. The price is \$3.50. The book takes up in a very attractive manner the principles and general methods of operation in the United States. It has been prepared as a text book for use in forest schools. On account of the breadth of the subject an attempt has been made to deal only with the more important features of operation, hence the innumerable variations in equipment and method which are peculiar to different forest regions are not included. There are six main sub-divisions of the book. Part I. deals with logging in general. Part II. refers to "preparing logs for transport." Part III. deals with land transport, and Part IV. with water transport. In part five an excellent summary is given of logging methods in specific regions, and in part six the various minor industries connected with logging are described. A valuable appendix also contains in very handy form a number of the most important log rules and tables of cubic contents. Much other valuable information is included in the appendix and a well arranged index is published at the end of the book. The book will make a strong appeal to all who are interested in the logging industry. It will be of great value to them and will also be extremely useful in all forestry schools.

The Renouf Publishing Company, 25 McGill College Avenue, Montreal, are the publishers' agents for this book for the Dominion of Canada and the Colony of Newfoundland.

Brazil's Wealth of Timber

Brazil is, without doubt, the country which possesses the most precious timber for general construction and shipbuilding, and for the manufacture of furniture and other articles. A country of varied and luxuriant flora in diverse climates and zones of vegetation, Brazil possesses a multitude of timbers which are highly appreciated for their resistance, beauty, and durability. The importance of this timber does not consist only in the hardness of the wood; in many species the grain is so beautiful and wavy that it appears as if engraved by skilful artists. Other species emit an odour of such sweetness and intensity that they seem to be the reservoirs of pure essences prepared by famous chemists. All the States possess timber of superior quality, but some of them are uncommonly rich in valuable species and varieties, as Amazonas, Para, Matto Grosso, Bahia, Espirito Santo, Rio de Janeiro, Minas Geraes, and Parana. In proof of the wealth of the forests of Brazil it is sufficient to mention the St. Louis Exhibition, where the samples of timber excited the enthusiasm of the American people, and where the press declared Brazil the richest forest country in the world. The timber trade, however, has not yet attained to a high degree of development, owing to difficulties of transportation, costly rates, and a lack of good ports for quick loading and shipping.

The Retail Dealer and His Problems

Competition Among Retailers—Short Length Troubles

Securing Competitive Business

Many a dealer has been puzzled, and always will be, as long as lumber is sold in bills and peddled around for the lowest prices, to know what to do in cases that are illustrated by the question that was asked by a young manager, "How can I get my share of trade, and a good profit with a man for a competitor who stoops to little tricks to get ahead of me, especially if he promises fair and then changes the bill a little to make a loophole to sell it, under the idea that 'it was another bill' and not the one we figured competitively?"

Then he adds in parenthesis (we have two or three), which I suppose means that he has this many competitors who are up to this little game. Or perhaps he meant he had lost that many bills through this scheme.

This is an old, old game that is generally played where the situation is supposed to be harmonious, and the result of an understanding to be good. But it is not in human nature to be "good" where a bill is going around in dull times among several young managers ambitious and eager for trade in order to make a good showing in their daily reports without some one among them working some scheme to capture it and still "save his face" with his competitors. At least, it is not in the nature of young fellows who are put there to get their share of the trade, and a little more, if they know they won't be "called down" by their employers who perhaps are party to an "understanding."

It is a debateable question whether there are not cases where the dealer is justified in making some changes in the bill a little to make a loophole to cover mistakes which may have been made in making it out. I have done this myself in scores of instances where the party has been in the habit of trading with me and I knew he was ignorant of what was in the bill. I always considered a customer a friend of mine and that he traded with me because he had confidence that I would do the right thing by him. Regarding him in this way, I felt in a way bound to serve his interests where they did not seriously conflict with my own. I have saved money for many a customer in bills that had been made out by carpenters who were indifferent to what grades or other things they specified as long as they didn't have to pay for them. Being, as I was, well versed in everything pertaining to the common building line, I could detect these things, and where I knew they would add a lot of unnecessary cost to the owner who was a friend of mine I generally pointed them out to him and explained the difference. If it was a matter of grades, I took him out in the yard and showed him the difference.

Cut Out the "Stuffing"

Many a bill has come to me for figures that I know was "stuffed" by a carpenter who wanted to get more stuff out than what was needed, so he could pick out what he wanted and have the rest sent back to the yard. In self-defence, I have gone over the bill, and eliminated enough to cut the cost materially. Of course, I was foolish enough to do this without letting the owner know, and explaining why there was no use in having material in the bill that he did not need and could not possibly use on the building. Then, if he took my view of it, and concluded to make the deal at my figures, and bought it without going elsewhere again, I could hardly be expected to urge him to go away and show the other fellows what I had done.

I have had bills brought to me by men who told me they had but little money and wanted it to go as far as possible and therefore to do the best I could for them. They perhaps were for small houses that they would move into from their dugouts, sod houses or small shanty. In looking over these bills I have often found where the careless or ignorant carpenter had specified the highest priced finish, the best flooring, and sills that were more suitable for a barn. If I knew the party and his circumstances, I felt I was doing him a favor to point out these things, and show him that a grade lower and a 6 x 6 sill were good enough for that purpose. Don't you suppose that these men felt grateful for the interest shown them in thus saving them their much needed money? This was one of the ways I had of holding my trade.

As a matter of course, however, this kind of interest did not always work to my advantage. There always is a proportion of men whose naturally suspicious natures lead them to distrust anything of the kind. They cannot imagine that a dealer will talk of changes in a bill that are not for his own interests, and therefore, they shy at any such suggestions. Then again, as is natural, some are parties who have done more or less trading at the other yard, but are desirous of giving all the yards in town a chance to figure on the bill, and if I suggested a change or pointed out an error in the bill, they would want to defer buying

until they had been around again. I have found through my observation and experience, that unless the man is a stranger, he has in his mind a preference as to the yard where he would like to buy the bill. He keeps this, of course, to himself. At the same time, however, he don't intend that the preferred yard is going to get any more out of him for the bill than he can buy it for elsewhere. The trick in a case of this kind is to find this out. If you can do this, there is no use then to suggest changes in the bill that are to his interest.

After I had settled down in the place where I won the greater part of my yard experiences. I found it was best, that when a bill came to me that I had good reason to believe the man preferred to buy at the other yard to give a reasonable price at which I would sell it, and not feel disappointed if my competitor sold it in this way. I believe I avoided a number of "scraps" that I would have had, had I done otherwise.

Another Old Trick

There is another old "trick" that I have often seen played that has turned the sale of many a bill from where it of right and fairness belonged. Better to explain it, I will recount an experience that rankled for some time in my mind against my competitor.

It was a fairly good sized house bill that I had good reason to think would come my way. The owner was a farmer whom I generally had on my books for a larger or smaller amount, and, as I knew he did some of his trading at the other yard also, I presumed he was on their books as well. It was several days after I had given him my final bid, that I met him on the street and inquired if he had made up his mind about it. In an embarrassed sort of way, he said that he had given the bill to the other yard, and in explanation of why he did so, went on to say that the bids were practically the same, although I was the lowest by two or three dollars, but that his wife who was with him at the time, was taken with the offer to give her her choice of the best front door she could pick out that he told her sold at retail for \$15, and as there were only plain doors in the bill, this offer looked so liberal that she persuaded me to buy the bill there. The manner in which he told this to me caused me to think that if his wife hadn't been with him he would have come over and seen me again. But the shrewd fellow in the other yard knew more about women folks than I did at that time and making her this present—as he called it, of a finer front door than any of her neighbors had, was too much for any consideration of any rights that I might have had in the matter, such rights as these become intangible in the light of an offer of this nature, and the average woman, or man either, is liable to ignore them.

Another Winning Card

Another thing that turns bills when there is close bidding between competitors, is the offer to furnish a better grade of some item that is specified in the bill. A better grade of flooring, or a little more costly finish for certain rooms in the house, may be substituted in such a way as to decide the deal. This may be done too without any taint of trickery being attached to it. You and I know there are times when certain items in the stock are low and in a bill you may be figuring you know you have not got enough of one of these items, or you may be entirely out of what is listed in the bill. You knew too that if you have to buy it the cost will be about the same as furnishing the item out of the higher grade which you have plenty of in stock. Now, if the bill is close, though you may not have a hint of the other fellow's figures, and you offer to substitute the higher for the lower grade, and by so doing hear the welcome words, "You may have the bill," are you going to call up your competitor before you close the deal and acquaint him with what you are going to do and the reasons for it, so that he won't feel that you are playing a trick on him? Probably he may in time find out the reason that landed the bill in your yard, and he may think you used it as a "loop hole" of an excuse for doing so.

We are all too apt to impugn the motives and reasons that we don't understand in the actions of our competitors, forgetting at the time they may be feeling the same way about us. There is hardly a dealer of any considerable experience in the business but will tell you he has sold bills and got a higher price for them than was offered by competitors. No doubt many of you who read this have had the same pleasing experience, for it is a pleasing thing to know that a man is willing to pay money for the privilege of doing business with you. There is no trickery about this kind of preference. A tricky man don't get it. It only comes from such previous dealings as have inspired the confidence of those giving it to the dealer, who is thus reaping the reward of his fair dealings with those who trusted him. But, when such bills

are sold, it is almost sure to entail suspicion and distrust in the minds of competitors who are in the dark as to how and why it was done.

It is unfortunate, but it is true, that in many instances, a situation that has been harmonious has been thrown into a state of war, and all previous agreements cancelled, just because some man has used his privilege to pay one dealer more for a bill than the competing dealer has offered it for. You who have been fortunate enough to receive such a preference know that the chances are that you haven't the chance to explain matters to your neighbor before there is a load of the bill going out of your yard. He sees that load, and perhaps turns to the bill book and goes over the figures again for a possible mistake. Finding none, he is puzzled to know how that a bill that was fairly his should have been lost to him. It won't be long before he seeks for an explanation, and when told the reason, it will require from him a great deal of faith in your word to believe it, for the average dealer is loth to believe that the other fellow is his superior in ability and personality and that his stock is better than his own. He forgets that his personality will sell goods to men that you can't. But such is the fact. Two men may be as nearly as possible equal in ability and salesmanship, and handle the same class of material, and yet one of them may possess that mysterious something which inspires the feeling of confidence in men who are conscious of the fact that in buying goods that they know little about, they must trust somebody. So they are drawn to the one who inspires their confidence in a greater degree than anyone else in the same business.

A dealer having this faculty enjoys an advantage that cannot be taken away from him, nor can it be neutralized by any artificial means, such as an agreement on prices, or any other means that may be thought of to equalize the inequality which more or less exists in a group of men that are competitors for the same business. I don't care what the nature of such agreement or understandings are, the dealer with the superior winning personality united with the knowing how to sell, is bound to get the larger share of the trade, and he will have it too, without being tricky to get it.

I have been in the position of the new dealer starting in and having it all to learn, and I have been also in that of the dealer with long years of experience in the same town, and I therefore know how the two regard each other, and their different viewpoints in considering each other's actions. As is natural, the young dealer don't understand the older and more experienced one, but the latter understands him, and this is one of the inequalities between the two. To offset this the young dealer cuts prices to get business, and is apt to get "sore" if he sees his low cut bills being hauled from the other yard. He is "sorer" still when he finds out that some of those bills have been sold for more money, and his natural feeling is that he has been tricked out of them.

Prices Not the Whole Thing

It is one of the hardest things for a beginner in the running of a yard to learn that prices are not the whole thing in the securing of trade; that he himself must have the drawing faculty and the knowing of something else about his business besides the knowing how to keep books and figure up the measurements and prices of lumber. It has nearly broken my heart to see bills going away from me that I thought I should have had, but I understood it better, where in later years, I had customers who would come in and hand me a list of what they wanted and tell me to do the best I could, as they were not going anywhere else. Every old dealer has had more or less of these expressions of trust and confidence in him from those of his customers who felt towards him more than a mere business relative. And I know they will agree with me in saying they are among the few things that sweeten a business life.

"How Can I Get My Share of Trade?"

is what causes the new manager in a new town many a sleepless night. He has been placed in charge of that yard and given to understand by his employers that this is what is expected of him, which means in the concrete that he must prove himself to be equal to the other one or more competitors in the place. Generally, there has been a previous attempt by his employers to effect some sort of an understanding in this matter of division of trade. Practically, however, this is more of a formality than anything else. Really, I think that anything of the kind has the effect of hampering the new man in the developing of a trade, and if he puts any reliance on what has been mapped out for him in this respect by his employers, it won't be a great while before he finds that the other fellows are "putting it over" him. There is "nothing to it," in any arrangement of the kind.

There are two principle ways in which a new comer in the lumber business of a town may go to work to obtain his share of the trade, and I don't know but that they are the only ways. Both are difficult enough.

One course is to fight your way into the position by open warfare, and the other is to start in and build up a business by using your brains instead of the cut-price pencil. The former one is the most expensive, and not calculated to produce a "good profit for the com-

pany," although it will no doubt produce a "volume of business." This method of course will produce a disturbance and the length of time it will last depends on the disposition of the other fellows to fight and continue it, with the chances in favor of producing a soreness of feeling that no truce will ever heal.

This was the old time method of doing, and I know old lumbermen to-day who think it the best and shortest way to fight your way in for an equal place at the business trough. That is the primitive way which you may see verified when you are "swilling the hogs."

It takes more time to get trade by the process of creating and building up, and it takes a real man with the business instinct of the real merchant to accomplish it. Such a manager needs no tricks, nor does he employ any but what are legitimate methods. More profit comes from pursuing the latter course, though it takes a little longer time, but it is the best way in the long run.—C. H. Ketrledge, in the Mississippi Valley Lumberman.

Marketing the Short Length Stock

Does it Pay the Consumer to Insist on All Long Stock— The Importance of Separating for Widths

It is too bad that in the economy of nature all the trees didn't grow so as to produce nothing but first and seconds, 14 and 16 feet long. Unfortunately, however, timber is imperfect, like man; there are knots and shakes and other defects, and there are stunted little trees that weren't intended to produce extra long lumber; while not even the greatest mathematician could squeeze long boards out of all the parts of the trees, says *Hardwood Record*. Consequently the lumberman who is confronted with the task of selling the product of the mill, and finds that he must dispose of a good many boards that are regrettably short, compared with the lengths which the consuming manufacturer declares that he must have, necessarily has to give a good deal of thought to the problem of finding a satisfactory outlet for them.

He may do one of two things: either sell his lumber just as it runs, with the buyer taking a chance on the length question, or pick out the long stuff and sell it at a premium to the man who insists that he must have it, at the same time accumulating left-overs of short stuff which must be disposed of. While a lot of lumber is sold, especially to furniture manufacturers and others who can use a great variety of cuttings, without a great deal of emphasis on lengths, the widths constituting the main question, interior finish manufacturers are the ones who keep after the lumbermen about lengths.

Most of them either buy with a guarantee as to length, with say 33 1-3 per cent. 14 ft. and 16 ft. or, what amounts to the same thing, exact a statement from the seller that the lumber will contain a satisfactory amount of long. So in the end it amounts to making sure of giving the interior finish man a big percentage of long stuff, either directly, by making a charge for it, or indirectly, in order to hold his business.

Selling the long lumber is comparatively easy, the main question being one of getting the price. If consumers can be found—and they are to be located without much difficulty—who will pay a good stiff premium for their long lumber, it doubtless pays the lumberman to lay out those dimensions for that particular trade, though of course he then has left on his hands a lot of short stuff, which must be sold as short without the redeeming feature of a few thousand feet of long to color it up.

Most consumers believe that the premium they are asked to pay for long, that is, the difference between the price of run-of-pile stuff and extra lengths, is ample to cover the difference in value. On the other hand, the lumberman who sees only this premium, without realizing that he has destroyed much of the salability of his stock, is likely to make the mistake of thinking that he has made good money on the sale, whether he succeeds in moving the remainder promptly at a fair price or not. And there's the rub. If the short stuff sticks around for a few months longer than it should, the mere interest on the investment, without figuring the possibilities of turning the money over profitably in other sales, is going to reduce the profit margin, when the lumber is actually sold, to a rather low figure.

Thus, in the last analysis, the question of the success or failure of the plan of picking out the long stuff depends on this factor: Has the short stuff remaining been moved at a good price within a reasonable time? Consequently the whole story, from the standpoint of the lumberman, lies in disposing of short lengths.

A shrewd wholesale hardwood man in one of the leading markets stated to the writer not long ago that he sincerely believed a lot of consumers, especially interior finish men, were deceiving themselves badly in pushing too hard for long stuff.

"Why," he said, "I know of a block of good chestnut, 10 ft. long, with some 12 ft. in the lot, which can be had for \$5 or \$6 a thousand less than lumber containing 14 ft. and 16 ft. lengths. Yet a lot of consumers shy at the first lot, just because it's short stuff, without stop-

ping to consider the difference in cost, and what it amounts to in the long run. If a manufacturer of this kind buys 50,000 feet of chestnut, with a guarantee of a third long boards, and pays \$5 a thousand more than he would have to pay for the short stuff I am referring to, the lot has cost him \$250 more; and this extra cost is concentrated on the long, naturally, making its price actually \$15 a thousand more than was paid for the short. It doesn't seem to me to be possible that there is that much difference in value."

The case cited is of course extreme. Ordinarily the difference in the price is not as much as that indicated, and for the general run of trade the added cost of long lumber is not as much greater as suggested; but nevertheless the instance quoted serves to make the point that consumers do sometimes set up long lengths as a kind of fetish, and in striving to get material which will fit into their business most readily they pay prices which are more than the lumber is worth to them.

This is not decrying the value of long lumber, by any means; as a matter of fact, a manufacturer of interior finish stated recently that there are many cases in his business when long stuff is not merely desirable, but necessary.

"Of course," he explained, "we can use a lot of short lengths, making heads and aprons and other short dimension stuff after we have cut the full casing lengths out of boards of that size. But when we come to making long ceiling beams, baseboards, and other stock which will not splice readily, we just have to have long lumber. The tendency nowadays to build bungalows and other similar types of homes, with exceptionally large rooms has called for a greater percentage of long lumber in the interior finish trade, and that is one reason why the purchase of much exclusively short-length lumber would not appeal to me, unless the price were mighty low. In that case I could buy enough special lengths to take care of my requirements. Personally, though, I prefer to buy the regular run of lumber, with the proviso that if it doesn't run properly as to lengths it won't be accepted."

And the consumer is, of course, in a position to enforce this provision, so that many lumbermen make a special point of giving their customers among the planing mill and interior finish trade better lengths than the price really justifies, simply because they know that this character of stock is needed, making it all the harder on the man who solicits this trade with nothing but short stock to offer.

In the interior finish trade, as in many others, however, the dimensions of the lumber form a secondary consideration to the intelligence of the men at the saws. Some sawyers and cutters in a factory of this kind can get all that is necessary out of what would ordinarily be regarded as short stuff; while others will make kindling wood out of long boards. But when the mill has a good, practical crew of men at work, with a careful foreman, who sees that in working up each job the long cuttings are made first, before the short are touched, in order that there may be an opportunity to get the hard sizes out of the stock before it is cut into for the easier dimensions, good results can be secured with a minimum of long stock.

Lumbermen with short lengths to dispose of have found that the matter of separating as to width plays an important part. In lines consuming poplar, for example, it has become well known that when the lumber is piled for width it is much more desirable from the standpoint of the user.

The big advantage of this plan is not only that a better price can frequently be realized for each width, sold separately, than if random dimensions were offered, but that placing the emphasis on the width helps to distract attention from the matter of length. In other words, instead of allowing the shortness of the boards to make them undesirable in the eyes of the customer, a negative quality is transformed into a positive one by concentrating on width and leading with this feature. This is not only a practical, useful plan which saves effort on the part of both lumberman and consumer, but also has something of applied psychology back of it.

There is an occasional market for short stuff, offered merely that way without the protection of special widths. One manufacturer who formerly made up his short poplar into lath, netting only a fair return, found a man who could use all of his short stuff without its being worked, so that he is getting a little more than before, without the trouble and investment required to convert it into lath.

Mr. R. H. Alexander's Views on Lumber Trade Matters

Mr. R. H. Alexander, Vancouver, B.C., in giving evidence recently before the Labor Commission at Victoria, referred to conditions in the lumbering industry. The price of lumber, he said, "was lower at present, than it was six years ago, and it was selling actually at a price below the cost of production. He accounted for this by the general weakening of the lumber markets throughout Canada and the United States and the great amount of competition experienced by lumbermen in British Columbia. One of the members of the Commission suggested that the prices charged by British Columbia mills showed

great similarity, to which Mr. Alexander replied that this was solely the result of similarity in the cost of production, not being due to any collusion on the part of lumbermen to maintain prices.

He declared that an eight-hour day in connection with the lumber mills would be an impossibility and that a minimum wage of \$4 a day would cause every mill in British Columbia to shut down. He did not think that ten hours was too long. Unskilled men, such as the Japanese, when employed in the mills, received \$1.35 per day. White men would not do the work given to the Orientals. The Orientals, to a certain extent, in this kind of work, were more suitable than the white men, as the latter were continually quitting. In many cases the employment of cheap Oriental labor provided facilities for the employment of the white men, who otherwise would be unemployed. He criticized many of the white men for apparently not wanting to work unless they got jobs according to their liking.

Mr. Alexander proposed that some legislation should be introduced to provide for official control of the payment of damages to men injured in the mills. He suggested that some insurance levy be made on the men in order to provide for sickness and injury benefits. He was of the opinion that men who were incapacitated for two weeks or more should be given half pay for the term during which they were unable to work. He was strongly of the opinion that something should be done to put an end to court actions in connection with accidents. At present, the injured man really got only a small portion of what the companies paid. He also suggested that legislation might be passed, relating to the payment of damages to men injured in logging camps. Under recent court decisions, these men do not come under the terms of the Workmen's Compensation Act. He suggested a levy upon all the men employed of 50c per month to which would be added a contribution from all the companies.

Safety Device for Swing Saw

I think that the safety appliance I made on our swing cut-off saw might do some reader good, and I have made a sketch of it for publication, says a contributor to "The Lightning Line."

Operators of swing saws always throw blocks close to their feet.

The next man coming to operate the saw will find it a very hard matter to stand on top of a lot of blocks, I don't care how small they may be.

Then, too, it often happens that two men want to use the swing saw about the same time and will stand close together, one waiting for the other, and then there is a good chance that someone is going to get hurt. With my floor guard only one man will be able to get in at a time. The only thing he will have to do is step over the guard. I have found this guard very practical in the shops here. An explanation of my sketch follows:

Material consists of four pieces of oak $\frac{3}{8}$ -in. x $1\frac{1}{2}$ -in. x 8-in., and one piece of wire screen 12-in. x 8-ft. x $\frac{1}{2}$ -in. mesh. The wood strips are fastened in an oval shape to swing saw bench support, holding the wire screen between as shown in the smaller sketch. Front of the cage is enclosed the same way. This cage is just large enough for one man. It keeps the blocks away from where he stands when operating the saw, giving him a secure footing without interference.

For a few minutes' time and a few cents cost you can greatly help to secure the safety of all operators of your swing saws.

The net earnings of the Riordon Pulp & Paper Company for the first eight months of the current year, after deducting depreciation, etc., have been sufficient to cover the whole year's charges for debenture interest (\$90,000) and the preferred shares dividend (\$70,000).

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Garlock Opens Another Branch

The Garlock Packing Company of Hamilton, Ont., have opened a branch at Calgary, Alta., where a stock of packings will be carried. This branch is under the managership of Mr. J. T. Dohm, well known in British Columbia and Alberta. Mr. L. G. Hargreaves of the Garlock western staff has been appointed Winnipeg Branch Manager, and Mr. W. B. Powell will represent the company in Manitoba and Saskatchewan. The Garlock company now have branches in Montreal, Toronto, Winnipeg, and Calgary.

A Valuable Catalogue of Portable Railway Equipment

The Orenstein-Arthur Koppel Company, Koppel, Pa., of which the Canadian Fairbanks-Morse Company, Limited, 444 St. James St., Montreal, P.Q., are the Canadian sales agents, have issued an attractive and extremely interesting catalogue describing their portable railways, industrial railways, narrow gauge sidings, narrow gauge public railways and railway equipment of all descriptions. The catalogue is extensively illustrated and a great deal of useful information is included, which enables a prospective buyer to understand readily the suitability of the various articles, for his own work. Of special interest to lumbermen are the various rails, switches, cars, etc., which may be used in connection with the piling and shipping of lumber stocks. Interesting information is also given regarding the logging cars manufactured by this company. These cars are built of any type and of any capacity required.

A New Matcher for Small Mills

A medium priced planer and matcher with all the features of the most modern fast feed matcher is now being placed on the market by J. A. Fay & Egan Company. This new machine is designed to fill the want for a general purpose, medium priced planer and matcher for use in the small and medium sized mills, where the quantity of work does not warrant the purchase of a high speed machine. However, the feeding speed of the No. 159 is sufficient to manufacture lumber on an efficient basis.

The Fay-Egan "Lightning" No. 159 is made in five sizes, viz.: 10, 15, 20, 24 and 30 inches wide by 8 inches thick, permitting the purchaser to get just the size machine needed, not too small or not too large. It is fitted with round heads, thin air-hardened "tungsten" steel knives, grinding and setting attachments and other features used on this company's high speed, fast feed planer and matcher, the "333." The feed consists of six powerfully driven rolls, all double

geared. An even pressure is maintained on the in-feed rolls by a patented spring tension. The 24 and 30 inch machines can be fitted with divided in-feed rolls and chip breakers before the top cylinder, so that two pieces may be fed at one time and, when used with center strip, produces two pieces of S2S and I edge.

When moldings are to be worked, the Fay-Egan "Lightning" No. 288 Profiler is applied. This is the same profiling attachment as used on the "333"; another instance where fast feed matcher features are used on a medium priced machine. The 159, with or without profiler, will do the fine work of the fast feed matchers and is still within reach of mill owners who could not afford to purchase high priced machines.

It is an ideal tool for the small mill and any interested party can get full description and price from the manufacturers, J. A. Fay & Egan Company, 465-485 West Front Street, Cincinnati, Ohio.

Carborundum Company Loses Valuable Officer

Ashmead Gray Rodgers for twelve years superintendent of The Carborundum Company's plant at Niagara Falls, died on October 23rd, 1913, as the result of injuries sustained through an accident on October 5th. Mr. Rodgers had a host of friends and acquaintances throughout the mechanical and chemical world and they will sincerely feel the loss of a man who was so pleasing in personality, democratic in his attitude to others and so capable in his chosen line of work. Mr. Rodgers was a native of Albany, N.Y., having been born there in 1872. Previous to his joining The Carborundum Company as superintendent he was superintendent of the Eddy Electrical Company at Hartford, Conn. The funeral service was attended by several hundred of the employees of The Carborundum Company, members of the Niagara Club and other friends. Mr. Rodgers was a member of the American Chemical Society, Engineers' Society of New York, Chemists' Club, Niagara Club, University Club and Country Club of Niagara Falls, and several other scientific and social organizations.

Atkins "AAA" Sliding Sleeve Arbor

E. C. Atkins & Company, the Silver Steel Saw People, have just secured a patent on a sliding sleeve arbor for use on automatic saw sharpening machines. The device insures the proper finish in both the face and back of the tooth, no matter how irregular the feed of the machine may be. It overcomes the "burning" of saw teeth, which hardens the metal, rendering the teeth brittle and causing it to crumble in the cut, thus making it impossible to swage properly.

The illustration on the next page shows the arbor in position and

A new matcher for small Mills—J. A. Fay & Egan Co.

The Atkins "AAA" Sliding Sleeve Arbor

attached to the head of a Hanchett machine. It will also fit the Covel or any standard gummer, or can be made of proper specifications for any grinding machine.

The upper or inside spring may be removed and the hub, holding grinding wheel, adjusted to any desired distance from the stationary collar, thus giving an automatic grinding action. This hub may be placed against the collar, which will give a stationary grind on back of tooth.

The lower spring is held in place by two small jam nuts which regulate the pressure on the spring. At no time will the wheel grind into the face or back of the tooth so as to injure it. After adjusting, its work will require no supervision from the filer, as there is no possibility of injuring the saw teeth.

Should the feed finger fail to bring the tooth up to the correct position, the lower spring will release the grinding wheel sufficiently to prevent burning. If the feed finger brings the tooth to position too quickly, the upper spring releases the grinding wheel, thus preventing injury to the teeth.

The arbor is furnished complete with all attachments and wrenches for adjusting the collar to any standard automatic saw sharpening or grinding machine. Full information may be secured by writing to E. C. Atkins & Company, Indianapolis, Ind., or any of their branch houses.

A New American Precision Saw

To meet a demand for a medium-priced saw bench and maintain a high standard of quality has been the attempt in the construction of

An interesting product of the American Woodworking Machinery Company — The "American" Students' Precision Saw— Above illustration shows an outline view—The machine itself is shown on the right.

the American Precision Saw manufactured by The American Woodworking Machinery Company. Its adaptability to either ripping or cross-cutting without changing saws, gives it the character of a universal machine, enabling the operator to shift from one kind of work to another without any appreciable loss of time. It will rip material 22½ in. wide and cross-cuts to 24 in. Saws up to 14 in. in diameter may be used.

The mitre gauges are neat in design, easily handled and accurate. They are graduated on the segment in degrees so that any angle may be obtained instantly. The ripping fence bevels and may be set at an angle to the plane of the saw and there are graduations in the table for quickly and accurately setting the fence without the aid of a rule. The table tilts to an angle of 45 degrees and is self-locking. The saw arbor runs on ball bearings and carries a saw that is equally adaptable to ripping or cross-cutting. The throat plate around the saw is removable so that dado or jointing heads may be employed. At the back of the machine may be applied either a boring or mortising attachment.

The manufacturers, American Wood Working Machinery Company, Rochetser, N.Y., will be glad to send a folder regarding this machine—illustrating and describing all of the above features.

New Defiance Product

The No. 5 Rounding, Cornering, Chamfering, Shaping, Planing and Boring Machine made by the Defiance Machine Works, Defiance, Ohio, U.S.A., as shown by the accompanying engraving, is designed to cover an extremely large range of work and is a most desirable tool for the use of manufacturers of wagons, carriages, sleds, agricultural implements, shafts, poles, gears and other similar work who do not require individual machines for each operation. Unlike most com-

Defiance No. 5 Rounding Machine

bination machines, it contains no objectionable features as the different classes of work can be accomplished without the loss of time in changing the machine and making adjustments. The different features are self-contained and require no altering outside of the renewal of knives when necessary.

The three rounding and chamfering heads are fitted to a special

American Students' Precision Saw

ground steel spindle 1 15/16 in. diameter and each carries three knives with chip breakers. One head has straight faced knives for chamfering and the other two have knives with circular faces each of a different size which will accommodate a large variety of rounding and cornering. The knives are held between two flanges which are supported by guides which are bored true on the inside to allow the cutting edges of the knives to set close up to the work; their faces are bevelled to an angle of 90 degrees to form a true bearing for square material while being rounded or chamfered; they can be quickly adjusted horizontally to regulate the depth of cut.

The planing head is fitted with three 6-in. straight face knives and is supplied on each side with an iron table with screw adjustment for regulating the depth of cut. The table is furnished with an adjustable fence which can be quickly set for straight or angular planing. All classes of hand planing can be done on this attachment within the range of the knives.

The Victor patent felloe rounding heads are made in halves and are adjustable for felloes of different widths. They are fitted with six capper shear cutting knives which are ground to suit the circle desired. A stationary guide rest between the heads regulates the depth of cut. A gauge pin is employed to space accurately the distance of the cut between the spoke holes. The pin can be set to round as close to the tenon hole as desired. The guides at each side of the cutterheads are adjustable to or from each other for different widths of felloes and to hold the work central with the cutterheads. The felloe is placed between the guides with the gauge pin in one of the spoke holes and is then brought down on the cutters and moved forward half way between the spoke holes. This operation is then reversed which completes the work, leaving the cut smooth and true absolutely free from tearing.

The boring attachment consists of a chuck fitted into the end of the main spindle and it will receive boring tools with shanks up to 1/2-in. diameter. The table which supports the material to be bored is made of iron and is 12-in. wide by 18-in. long and is gibbed to the end of the main frame; it has a screw adjustment vertically of 4-in. from the center of the boring bit and will accommodate material 6 inches thick.

The counter is furnished as follows: Shaft 1 11/16 in. diameter by 36 in. long; two No. 1 roller bearing drop hangers fitted with rack and pinion belt shifting apparatus; driving pulley 20 in. x 4 in.; tight and loose pulleys 10 in. x 4 in. with the loose pulley fitted with sectional bronze bearings; speed 760 revolutions per minute; pulley on cutter head spindle 4 in. x 4 in., speed 3,800 revolutions per minute.

Further particulars and price will be cheerfully furnished by the makers, The Defiance Machine Works, Defiance, Ohio, U.S.A.

Important Wood Splitting Invention

The accompanying illustration gives a clear idea of the appearance of an important machine which has recently been perfected and put upon the market. This machine was designed and patented by Mr. W. Kent, Meaford, Ont., and is so designed that it will saw and split hardwood in a remarkably efficient manner. The principle of the machine is a combination of a direct-acting steam digisaw and a splitting equipment, providing, in this manner, for the cutting up and splitting of the hardwood logs with which it is fed. This machine will render valuable enormous quantities of small and rough timber from which all logs suitable for manufacturing into lumber, etc., have already been taken.

The machine can be set up in the yard of any sawmill. The only actual connection with the mill, that is necessary, is a small steam pipe required for driving the splitter's engine. The equipment, when set up, is compact and takes up very little room. The machine can also be set up in the bush, and a small portable boiler used to furnish steam. The most suitable place, however, is the sawmill yard, where all timber coming in from the bush and not suitable for lumber, can go to the splitter. Lumber operators will appreciate the possibility of making an important saving in this manner, by taking out all timber at one operation.

The splitter will handle timber of any ordinary length, as it comes from the bush. The timber first goes to the saw where it is cut into proper lengths. Then it passes automatically to the splitter, where it is finished, ready for piling in the yard. The machine can be adjusted to cut and split wood any length from 12 in. to 4 ft. The splitter will cut into halves or quarters any sized stick required, in one operation, and will handle timber from 4 in. to 36 in. in diameter.

A two-inch steam line from the boiler plant is sufficient to drive the equipment, if a steam pressure of 90 lbs. or more is maintained and the steam line is not more than 100 feet long. If the splitter cannot be operated in connection with the sawmill, a portable or stationary boiler of almost any type and of 35 h.p., 90 lbs. or more working pressure, will be sufficient.

No particularly skilled labor is necessary in operating this machine. Any ordinary mechanic can, with a little practice, operate the machine with perfect safety, and with eleven men and one team of horses can cut, split and pile from 40 to 50 cords of 4 ft. wood per day of ten hours.

Death of Frank Davison, Bridgewater, N.S.

Bridgewater, N.S., Nov. 11.—Frank Davison, one of the most prominent lumbermen of the south shore, died yesterday, following a stroke of paralysis. He is survived by his wife, two daughters, and one son.

An important new invention—Kent's Cordwood Splitter

The Yard Foreman Gets a Lesson

"Write a story of my experiences! Hemlock splinter!" only that was not the expression the yard foreman used. "I have trouble making out my dray receipts. None of the writing business is mine.

"Tell you of some of my impressions? My idea, young feller, is that the yard foreman gets his share of the blame, and blamed little share of the credit. 'Spose its natural if 'tain't exactly right.

"The old man is pretty strict and manages to keep us stirred up an' goin'. Never can tell when he will pop up and want to know about things that are none of his business, or so they appear to me. Tells me to go ahead and run the yard, look after the drivers and horses, and just when I get things to suit me along he comes and turns them upside down.

"Yes, he is a crank, but there are a lot worse'n he is, a heap lot worse.

"Taught me a lesson one day; oh, it was years ago, and it was a lesson I needed—needed it bad. He had just given me a raise and made me yardman, or foreman, whatever he calls it. It was a spring day, and we were sweating and fretting trying to handle twice as much stuff as we had teams and men to handle.

"Well, as I was sayin', he came along just as I was wondering how the Sam Hill I'd keep about seven contractors from murdering me for not giving them what they wanted whether I had it or not. He had both pants' pockets full of silver. Out he pulls a double handful of it.

"See that, John," he said. "Well, that is a small part of what you are costing me."

"If I don't get this load of flooring out to Cramer, this job will cost me my life," I answered, mad as a hornet that he should come a-buttin' in when I was busy.

"Pete can load that flooring as well as you can," he answered, and carried me with him by a twist of his thumb,—a habit he has.

"Blamed if he didn't make me walk through every alley, and crawl in behind the lumber piles. Every time he saw a piece of stock that was not where it should have been, he'd throw down the price, what we sold it for at retail, and bellow, when I protests: 'Got as good right to throw my money away as you.

"Well, before that trip was over the Old Man had run out of money. He made me leave it where he threw it down. I went back over the yard and tried to pick up the silver, but never got more'n half of it.

"Took it to him in the office, and he said, actin' as though he was surprised:

"Well, well, that is a great deal more than I expected to get back. Now, young man, see if you can salvage as much from the money you have been throwing away."

"He sat there, knowing I was as busy as a man could be, and told me what all about the price of boards and piece stuff. Says, he: 'A piece of 2 x 4-12 is worth 24 cents, we sell them for 25 cents by the piece, did you know that'

"Sure," I answered. "Well, the next time you want to throw away one of my quarters come into the office and get it from the bookkeeper, then I can keep track of what you are a costin' me, but if ever I find lumber scattered about on the yard, thrown about helter skelter, as it is now, just you forget to come back here."

"Busy!" He snorted, "'Tain't no excuse, never was an' never will be. Keep that yard straight out there or keep out of it."

"That was one of the lessons the Old Man taught me and one I ain't forgot, let me tell you.

"When I look at a pile of lumber now I don't see so many pieces of 2 x 4, so many boards, lath, shingles or flooring, but I see a little pile of nickles, dimes, quarters, halves or dollars. I'd no more think of permitting the stock to be mishandled than I would of asking that grouch, the bookkeeper, for a half dollar to chuck into the street.

"Horses, wagons, harness, buildings, fences, millwork; in fact, all the stock we carry looks like ready money to me now. The Old Man tells me I am the custodian of his real assets, and that puts me on my mettle.

"Oh, yes, I get many compliments on the appearance of our yard, and they come from every one who sees it, except the Old Man. Got sore one day. Had the yard as clean as the parlor in an old maid's home. Old Man came around and I edged up, expectin' a pat on the back.

"Looks better," I said, kinder pavin' the way.

"He turned that big heavy figure of his'n, and those little steel gimlets he uses for eyes bored into me. 'Better,' he growled; 'it'll look better to me when you learn to pile lumber to keep out the rain. Look at those 2 x 8s there; just invitin' destruction,' and they sure were.

"I took them 2 x 8s down and re-piled 'em, with the help of Pete, and from that day to this I ain't ever invited the boss to compliment me on the appearance of the yard. He can always find something in it that ain't just right, and he ain't a bit slow about tellin' me when things ain't to his fancy.

"Why don't I quit? Say, did you ever hear of a fellow learning

anything from some one who knew less'n the fellow who was trying to learn? Well, I never did. When I know about one-half as much as the Old Man knows I am going to start up for myself. Till I do know that much I am going to stick to the Old Man and keep on a learnin'.

"I'm young yet, though this rough work and these rough clothes rather give that statement the lie, and I don't intend to start in business for myself until I know something about the business. I've seen them come in here, line yards, mail order ideas, and others to take a fall out with the Old Man. But they are the ones that fall out. The Old Man sits tight, and he does it because he knows and the others only think they know. That hunk of cheese in there that keeps the books; yes, he is a pretty clever fellow, he thinks the Old Man will make some provision for us. That don't appeal to me as the Old Man's way of doin' things, but I am satisfied, certain he'll make lumbermen of us if we stick by him long enough."—"The Yard Man," in the Lumber World Review.

Personal News of Interest to Lumbermen

Mr. J. Conrad Gadoury has been appointed secretary-treasurer of the Canada Sales Lumber Company, Limited, Montreal, in succession to Mr. T. G. Savard, resigned.

The firm of Vitale and Rothery, forest engineers, of New York City, have been retained by the Canadian Government to advise with the Canadian Conservation Commission in planning the survey of the Crown lands in the Province of New Brunswick for the purpose of estimating their timber resources, drafting appropriate conservation laws, etc.

Denis Murphy, president of the Ottawa Transportation Company, in a recent interview, said: "This is the poorest season we have ever had. We have taken less lumber to Montreal this summer than ever before since we have been in business." Mr. Murphy accounts for the falling off by the fact that Ottawa mills have reduced their cut this year.

J. W. Hyde, of Jacksonville, Florida, and H. G. Clarke, of Pittsburgh, Pa., timber brokers, who have several branch offices in the States, were at Vancouver recently. They will establish branches in Seattle and Vancouver. Mr. Hyde expressed the opinion that the new tariff will not be greatly felt by American manufacturers. While present conditions were poor, he expected to see good business shortly.

W. T. Egan, wholesale lumberman, has moved from the McKinnon Building, Toronto, to larger offices at No. 2 Toronto Street. This was necessitated by the large and growing trade that Mr. Egan enjoys throughout the province. Besides handling a line of American and Canadian hardwoods he is also the Ontario and Quebec sole selling agent for the celebrated Diamond Brand hardwood flooring manufactured by Siemon Bros., of Warton, Ont.

Sydney M. Jones, of Bangor, Me., son of Hon. H. M. Jones, formerly at the head of the Katahdin Pulp and Paper Company, and now manager of the Partington Pulp and Paper Company, Limited, of St. John, N.B., has accepted a position with the Partington Company, in charge of the engineering and timberland department. He will have his headquarters at St. John. Mr. Jones is a graduate of the engineering department of the University of Maine, and since graduation has been interested in several lumber operations in that State.

R. F. Whitmer, F. T. Chandler and W. F. Fuqua, of Philadelphia, recently paid a visit of inspection to the property of the St. Lawrence Pulp and Lumber Corporation at Pabos Mills, P.Q., and were well pleased with the result of their trip and the progress that is being made with the construction. The new saw mill will be in operation in the Spring and work on the one hundred ton sulphite mill, which the Corporation are erecting at an outlay of one million dollars, is well under way. About eight miles of railway have been graded and four miles are in operation. The company own 630 square miles of timber limits in Gaspé and Bonaventure which are valued at ten million dollars.

Mr. G. B. McKay, Crown Timber Inspector for British Columbia, recently returned from a visit to a number of the islands in the Gulf of Georgia and reported that these islands were rapidly being settled. The movement is the result of a change in the class of man seeking employment in the logging camps. Previously, the loggers were content to earn a considerable sum of money during the season and then spend the money in a few weeks in the city. Nowadays many of the men are building homes and improving the land in some of the rich districts near where they are employed in logging. Statistics recently prepared show that some 8,000 men are thus employed in logging operations and that a large number of them have begun to settle on homesteads.

U. S. Government Studying Cypress

Cypress grows along the Atlantic Coast and Gulf of Mexico from Maryland to Texas, and in the Mississippi River Valley it extends as far north as Cairo, Illinois, at the junction of the Mississippi and Ohio rivers. It is distinctly a tree of the swamps, and more than 90 per cent. of it is found at an elevation of less than 100 feet above sea level. Extensive cypress forests occur in the delta of the Mississippi, covering several thousand square miles, and also in some of the large swamps of Georgia and Florida, such as the Okefenokee and the great cypress swamps fringing the Everglades. In some places it occurs where the soil is covered with water for weeks or months at a time, and in a few places the base of the trunk is submerged throughout the year. Usually the lower part of the trunk is heavily buttressed and numerous projections, or "knees," are sent up from the roots, probably as an aid in securing air.

Cypress wood has great durability, which adapts it to many purposes for which some other species are unsuited. Census statistics show that in 1911 over 981,000,000 feet of it were used for lumber, lath and shingles, and that in point of annual consumption it stands seventh among the various softwoods, or coniferous trees. It is one of the few conifers which shed their leaves each winter. It is used for a great variety of purposes, such as tanks, cisterns, columns, exterior and interior finish, railroad ties, poles, and wharf piling. It is especially valuable for greenhouse construction.

While cypress wood has so many good qualities, the tree itself presents many problems to the forester. Its rate of growth, they say, is extremely slow, so that the cost of producing large-sized timber is great, as compared with that of producing wood from other more rapid-growing trees. Furthermore, it does not readily reproduce itself, and there is some doubt as to whether mature stands will replace themselves after being cut. It is an open question, according to the authorities, whether it now occurs. Much of the land upon which it grows is capable of high agricultural development when drained. Even where it might be reproduced, it is not known how this reproduction is brought about. With a view to throwing light on these important problems Mr. W. R. Mattoon, of the United States Forest Service, is undertaking a study of Cypress and its forest conditions.

Interesting Booklet on "Midland Sash"

"Midland Sash" is the title of an attractive booklet which has been issued by the Georgian Bay Shook Mills, Limited, Midland, Ont. The booklet contains a list of the various stock sash turned out by this company, together with prices. The Georgian Bay Shook Mills are making a specialty of stock sash, and, from experience, assert that they can cut the labor cost of sash in two, if they have the right kind of orders. The single sash is the one that costs a lot to make and it is not fair to the men who orders a quantity of each size that he should be charged the same price as the man who buys in small lots. Many dealers in builders' supplies have heretofore refused to stock sash for this very reason, and also because they did not have a reliable source of supply, with good goods, reasonably prompt deliveries, and prices in proportion to the size of the order. The Georgian Bay Shook Mills, have worked out a plan upon which a good profit can be made in handling stock sash. They can cut the cost of manufacturing and are offering this saving to buyers, in proportion to the size of their orders. In addition to their regular trade discounts, they are making the following quantity discounts:—1 doz. of a kind and size, 5 per cent.; 3 doz. of a kind and size, 10 per cent.; 5 doz. of a kind and size, 15 per cent.; 100 of a kind and size, 20 per cent. The variety of sash included in this booklet give the dealer an excellent opportunity to save money in this manner. The booklet contains also a number of forcible maxims in connection with the stock sash trade, one of which sums up the whole proposition as follows:—"You can't make money quicker than by ordering your sash ahead in stock quantities. See the extra discounts you can get."

Practical Work in Forestry

During the last meeting of the National Conservation Congress, in Indianapolis, at a meeting of foresters and others interested in forestry questions, decision was reached that in order to make progress along practical lines it was necessary to do more than to make speeches. The lines of practical work were discussed and the whole matter was put in charge of a committee, which should appoint other committees to make careful investigations, supported by ample funds, and to report at the next meeting of the congress.

That committee consisted of Government Forester Graves, J. B. White, former president of the congress; E. T. Allen, head of forest work on the Pacific coast; W. R. Brown, representing the northeastern part of the country, and E. A. Sterling, representing wood preservation. Thus were represented in the committee the Government, the Conservation Congress, the Forestry Association, and organized private enterprises in behalf of forestry.

This committee has appointed its subcommittees drawn from

men of special experience in the respective subjects with which these committees will deal. Foresters, governors, members of Congress, heads of universities, with a few who represent the lumber industry, which must actually carry out the work of forestry so far as private holdings are concerned, make up this remarkable list. It shows further that the Government Forest Service, the States, educational institutions, the American Forestry Association and the National Conservation Congress are all working hand in hand to the same great public end. The time has come when the exponents and promoters of forest conservation have determined to supplement talk with work.

An Interesting Laidlaw Catalogue

The R. Laidlaw Company, Traders Bank Building, Toronto, have issued a new illustrated catalogue of their various classes of manufactured stock, including especially, solid and veneered doors. The catalogue also deals with verandah columns, verandah balusters, newel posts, moulding, oak flooring, beaver board, rubber roofing, timbers, etc. The cover of the book represents a very handsome door similar to one of the company's stock designs. Two pages at the back of the catalogue are devoted to the presentation of useful information in regard to the care and laying of oak flooring, and the care of hardwood doors. In its general conception and make up, this catalogue is quite unique and ought to result in bringing much additional trade to the company.

Barbados Trade Report

S. P. Musson, Son & Company, Barbados, report under recent date as follows: Lumberstuffs—White pine—The Trn. Schr. "Edyth," arrived on the 1th inst., from Mahone Bay, with 142 M. ft. which had been sold to arrive at \$33.50 and \$25.50 for merchantable and second quality respectively. Stocks are ample for present requirements. Spruce—The "Edyth," also brought 70 M. ft. spruce which was sold at \$27.00 for shippers. Dealers are well supplied with this description of lumber. Pitch pine—No receipts, but stocks are ample. Shingles—The Trn. Schr. "Adriatic" arrived on the 19th inst., from Dalhousie, with 1,503,000 extra No. 1's. which had been contracted for some time ago at \$2.55. No receipts of Long Gaspé, but market is well supplied.

Grain Growers Urging Free Lumber

The Grain Growers' Association of Western Canada is still urging the removal of the duty upon United States lumber. At a recent meeting of the Canadian Council of Agriculture, held in Regina, Sask., representatives were present from the Saskatchewan and Manitoba Grain Growers' Associations and the United Farmers of Alberta. A resolution was then passed asking the Dominion Government to transfer lumber to the free list.

Miscellaneous Items of Interest

A report from Ottawa states that paper prices in Canada are likely to advance, as a result of the United States tariff. The larger market offered by the United States is considered as certain to bring about this result.

Representatives of the British Columbia Lumber & Shingle Manufacturers, Limited, waited on the Federal ministers who were on the Coast recently, and asked that the use of Canadian timber be made compulsory in government dock and harbor contracts. During the next three years public works will be carried out calling for 100,000,000 feet of timber.

The market for Canadian news print, which was dull throughout the spring and summer, has been picking up, and the Laurentide Paper Company reports that it has closed contracts covering the bulk of its output up to the end of 1914 at satisfactory prices. This improved tone of the market is partly due to the new American tariff now in force, by which the product is going into the United States without any of the restrictions imposed by the old reciprocity agreement.

British Columbia coast lumber manufacturers are anxious regarding a proposed change in the tariff on lumber imported into Chile, South America. The Chile government is reported to be considering an increase in the duty. During the past two years and a half British Columbia has exported 11,000,000 feet of lumber to Chile. During the same period the United States have sent 139,000,000 feet and efforts have been under way in British Columbia for some time to switch some of this trade to British Columbia. The matter was brought up recently before the council of the Victoria Board of Trade and the Trade and Commerce Committee was instructed to take up the matter with the Hon. Mr. Ross with a view to taking any steps that are necessary to protect the interests of the industry in British Columbia.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

WANTED—2 inch spruce for 1914 delivery. Full thickness merchantable spruce, culls out. 2 x 5, 2 x 6, 2 x 7, 2 x 8, mostly 2 x 6 and 2 x 7, 9 feet and up, to average 16 feet long. Cash Buyer, Box F, Rutland, Ont. 21-24

Hemlock, pine or spruce logs wanted, 15,000 to 20,000, for immediate or later shipment. Give full particulars. Box 100, Canada Lumberman, 119 Board of Trade Building, Montreal. 21-24

WANTED

1½-in. 2-in., 3-in. and 4-in. Hard Maple. 1-in., 1½-in. and 3-in. Soft Elm. 1-in. Basswood and Ash. Can use Log Run. State what you have and lowest cash prices. Box 910 Canada Lumberman, Toronto 22-23

Wanted to Buy

We are in the market for the following: 1,000 35-ft. and up Cedar Poles. Odd lots of Spruce and Pine. Square Timber. State best prices net cash. Delivery coming season. Apply P. O. Box No. 1595, Montreal, Que. 21-t.f.

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City. Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass. Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

Hardwood Pickets Wanted

Beech, Birch and Hard Maple.
1 x 1 x 42.
1 x 1 x 48.
1 x 1½ x 42.
1 x 1½ x 48.
1 x 1¼ x 42.
1 x 1¼ x 48.
Require Thickness, 1/16-in. Plump. Quality—Free from all defects. Can take delivery of green or dry stock. Apply to The Canada Wood Specialty Co., Ltd., Orillia, for full particulars, price, etc. 24-1-TF

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

WANTED—Hemlock or Spruce Logs or Lumber. Apply to Box 905, Canada Lumberman, Toronto. 22-23-24-1-2

For Sale-Lumber

For Sale

Peeled cedar post 4½-in. to 7-in. top, 8 ft. long. Best of quality and made from green cedar. Chas. Pedwell, Lions Head, Ont. 9-t.f.

For Sale

500 cords Tan Bark. All sizes Hemlock Timber, same cut off deeded lands. Apply to CANADIAN COPPER CO., Coe Hill, Ont. 21-24

For Sale

Two cars 4/4 log run Birch. Three cars 5/4 No. 2 Common and Better Birch. Box 900, Canada Lumberman, Toronto. 21-22

For Sale

Six or eight carloads of Cull Cedar Ties. These make a firstclass siding tie. We want to move same at once. The John Carew Lumber Co., Ltd., Lindsay, Ont. 21-22

For Sale

50,000 ft. 4-in. Hard Maple, 6 to 10 inches wide, largely 12 ft. long, and consisting principally of tight Boxed Hearts. For prices and full information, address The London Lumber Co., Ltd., London, Ont. 22-23

For Sale

Quantity seasoned pine, 1, 1¼, 1½, 1¾ and 2 inch. Apply Box 10, Eldorado, Ont. 22

Wanted-Machinery

WANTED—Steam Engine, second-hand, about 20 x 24. Describe fully and name lowest cash price. York & Sunbury Milling Co., Ltd., Gibson, N.B. 20-t.f.

For Sale-Machinery

JOINT CURATORS

Sale by Auction of Valuable Timber Limits

PUBLIC NOTICE is hereby given that the Timber Limits hereinafter mentioned will be offered for sale, without reserve, by public auction, on the 17th day of December, 1913, at ten of the clock in the forenoon, at the office of Messrs. LaRue & Trudel, Accountants, Dominion Building, No. 126 St. Peter Street, in the City of Quebec, viz:—
Limit No. A, River St. John, containing 28 square miles, more or less.
Limit No. B, River St. John, containing 40 square miles, more or less.
Limit No. 2, Salmon River, containing 41 square miles, more or less.
Limit No. 3, Salmon River, containing 74 square miles, more or less.
Limit, Rivers Chambers and Salmon, containing 77 square miles, more or less.

CONDITIONS OF SALE
1. The purchaser will pay, in addition to the purchase price, payable cash on transfer of the licenses, the auction duty of one per cent., and the transfer fee payable to the Crown Land Department of the Province of Quebec, on the transfer of the licenses.

2. The purchaser will take the said limits subject to all and singular the conditions of the licenses issued by the Department of Crown Lands for the Province of Quebec, and without warranty on the part of the vendor, save that the licenses have been issued and are his property.

3. The ground rent payable to the Department of Crown Lands in respect of the said limits has been paid up to the 30th of April next (1914).

4. Intending purchasers will have an opportunity of perusing the licenses by applying to Messrs. LaRue & Trudel, at their office, Quebec.

Rutland, Stuart, Grant & Thomson,
Solicitors for Vendor,
22-23 56 St. Peter Street, Quebec.

FOR SALE.—One of the most successful, best-equipped shingle plants in Vancouver, B.C. Owner wishes to retire. Can show net profits 20 to 40 per cent. over ten years. Steady demand for output—about 225,000 per day. United States market will be another big factor. Timber limits if desired. Less than \$20,000 will swing this plum—balance good terms. Apply editor, Western Lumberman, Vancouver, B.C., for particulars. 21-22

Miscellaneous**For Sale**

Tugboat, 65 ft. over all, 14 ft. 3 in. beam, 8 ft. deep, fully equipped with winches, 10 and 20-in. compound engines, surface condensers and pumps. All connections and pipes brass and copper. Address T. N. McGrath, Tusket, N.S. 20-t.f.

Tenders for Pulpwood Limit

Tenders will be received by the undersigned up to and including Wednesday, the 31st of December next for the right to cut pulpwood on a certain area situated on the Metagam River in the District of Temiskaming.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the Crown dues of 40c per cord for Spruce, and 20c per cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario,—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario, for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into an agreement to carry out the conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, Ont., Sept. 17, 1913. 20-24

Important Auction Sale of Valuable Pine Timber Limits in the

**Townships of Hammell and
Merrick, District of Nipissing
and Province of Ontario.**

There will be offered for sale by public auction in the rotunda of the New Russell Hotel, in Ottawa, on Monday, the first day of December, 1913, at 2.30 o'clock p.m., the timber berths known as Berths No. 6 and No. 8 of the Township of Merrick, containing an area of 8¼ square miles more or less; also timber Berths Nos. 1, 2, 3, 4, 5, 6, 7, 8, and 9, in the Township of Hammell, containing an area of 27¼ square miles, more or less.

The Temiskaming & Northern Ontario Railway runs across one corner of the lots in the Township of Merrick, while the Township of Hammell is situated on the waters of the Tomiko River, a tributary of the Sturgeon. These Berths are held by the vendors under renewable licenses from the Department of Lands, Forests & Mines of the Province of Ontario.

The Berths will be sold in two parcels. Other terms and conditions of payment will be made known at the time of sale. For further information apply to W. A. Cole, Auctioneer, Ottawa. 21-22

A Lumberjack's Thrilling Experience

As a subject for a moving picture show, the recent experience of a lumberman in the Rainy River, would furnish something quite exceptional. Clyde Buell, of Minneapolis, was the hero. He was working at Fort Frances for a lumber company and was out on a raft of logs. After striking a jam, the raft loosened, and Buell, clinging to a single piece of timber was carried down the river towards the rapids. He had given up hope when he saw a large bull moose with its head and antlers above water swimming safely from the rapids. Buell let loose from his log and grabbed one horn of the antlers and shifted himself to the back of the animal and rode it to shallow water. The moose fought hard, but would sink beneath the water and soon gave up and swam ashore.

The Value of Maple

Though at one time in the early history of the country an average of 6,000 maple trees were destroyed in clearing the ordinary New York or Pennsylvania farm, maple is today, according to the U. S. Department of Agriculture, one of the most widely used and valuable native hardwoods.

A bulletin on the uses of maple, just issued by the department, states that the wood finds place in an enormous number of articles in daily use, from rolling pins to pianos and organs. It is one of the best woods for flooring, and is always a favorite material for the floors of roller skating rinks and bowling alleys. It leads all other woods as a material for shoe lasts, the demand for which in Massachusetts alone exceeds 13,000,000 board feet annually.

Sugar maple stands near the top of the list of furniture woods in this country. The so-called "bird's-eye" effect is probably due to buds which for some reason can not force their way through the bark, but which remains just beneath it year after year. The young wood is disturbed each succeeding season by the presence of the bud and grows around it in fantastic forms which are exposed when the saw cuts through the abnormal growth.

Maple is one of the chief woods used for agricultural implements and farm machinery, being so employed because of its strength and hardness. All kinds of woodenware are made of maple, which holds important rank also in the manufacture of shuttles, spools and bobbins. It competes with black gum for first place in the manufacture of rollers of many kinds, from those employed in house moving to the less massive ones used on lawn mowers. Athletic goods, school supplies, brush backs, pulleys, type cases, and crutches are a few of the other articles for which maple is in demand.

Seven species of maple grow in

the United States, of which sugar maple, sometimes called hard maple, is the most important. The total cut of maple in the United States annually amounts to about 1,150,000,000 feet. Nearly one-half is produced by Michigan, with Wisconsin, Pennsylvania, New York and West Virginia following in the order named. Sugar maple is in little danger of disappearing from the American forests, for it is a strong, vigorous, aggressive tree, and though not a fast grower is able to hold its own. In Michigan it is not unusual for maple to take possession of land from which pine or hardwoods have been cut clean, and from New England westward through the lake states and southward to the Ohio and Potomac rivers few other species are oftener seen in woodlots.

FOREST SURVEYS

The Montreal Engineering Company, Limited, through its Forestry Department, carries on forest surveys, timber limit cruising and makes brief expert examination of forest lands.

This department is under the guidance of engineers and lumbermen thoroughly familiar, through years of experience, with lumbering conditions in this country.

Absolutely accurate results may be obtained at a cost varying from less than one cent to about four cents an acre.

Water, power projects are developed and financed by the Montreal Engineering Company, Limited, 164 St. James Street, Montreal.

R. O. Sweezy, Civil and Forestry Engineer, Manager Forestry Department.

Review of Current Trade Conditions

Ontario

During the past fortnight, a rather better tone has developed in the lumber trade in Ontario, although there is nothing like reasonable activity. Wholesalers are receiving more enquiries than usual of late and a moderate amount of business is in progress, with prices about steady. There is quite a fair demand for special sizes of hemlock. Retailers are buying shingles in advance of their requirements, but not to the same extent as they were a year ago. The activity in shingles is likely to increase, as British Columbia manufacturers are showing signs of preferring the trade in 18 in. shingles in the Eastern States to that in 16 in. shingles in eastern Canada. Representatives of British Columbia mills have already been in the Eastern States and Canada looking into this question and report an excellent outlook for trade in the States, now that the duty has been removed.

Ontario retailers continue to conduct a hand-to-mouth business, buying only for immediate requirements. If prices advance after the new year, the consumer will have to foot the whole bill as retailers will have no large stocks on hand, purchased at lower prices. White pine continues, very quiet. The building situation in Toronto is more encouraging than usual. Building permits for October were for a total value of \$1,987,027, or an increase of nearly \$500,000 over the corresponding figures of 1912.

Ottawa dealers report considerable inconvenience on account of the scarcity of freight cars, which are being used extensively in connection with the shipment of wheat. This is an annual trouble and one which involves very heavy loss to the lumber trade. All grades of lumber remain firm and some advance is noted in pine shipping culls and mill run. No important difference is yet reported in connection with the effect of the United States tariff upon trade at Ottawa. It is expected that very beneficial results will develop next season. The Ottawa mills are still working with full staffs, but will probably close down within a week or two.

Trade conditions at the Tonawandas continue very quiet. Weather conditions have been favorable and an average amount of building is in progress, but orders are slow and wholesalers are keeping down expenses as much as possible. Retailers are showing a little more inclination to stock up and seem to be expecting some improvement in the near future.

Eastern Canada

At Montreal, a moderate amount of business is reported, with a scarcity of spruce and lath, and prices in general steady. Buildings under contemplation are numerous, the permits for October being well on the way towards double those of October, 1912. The total for the year to date also shows a substantial increase. The export trade is exceptionally busy with shipments to the Old Country, on account of the approaching close of navigation. It is now expected that this year's exports to Europe will not be less than those of last year, as was feared at first. The customary congestion at the docks is not in evidence this year because of the small amount of imports.

A better demand is soon expected in the near future for pulp and paper. Canadian news print mills are enjoying a good demand, most of them being sold up for nearly all next year.

In the New England States and New York States, lumber trade conditions at present are rather mixed. The continued bad weather, together with unsatisfactory financial conditions have combined to put an end to speculative building, so that the lumber market generally is weak and uncertain. The weakness is most evident in spruce and shingles. Within the past three weeks spruce has dropped about 50c in price. Some improvement is possible if warm weather continues, as eastern mills are shutting down. The proposed new banking and currency bill is another obstacle to business. Until its details are published and settled, much uncertainty will prevail as to future financial conditions. The retail trade continues its hand-to-mouth policy. Quite a fair volume of business is being transacted however, but prices show little or no profit. Low grade southern pine is selling at the lowest price it has reached for many years, and there are no indications of improvement. Low grade white pine on the other hand, continues strong and stocks seem to be pretty well cleaned up.

Frames and dimension spruce at Boston are selling at about \$24, although rumors of sales at even lower prices for future delivery have been heard. Random is in a little better demand than dimension, but prices vary, with a tendency to favor the buyer. Boards are slow and low prices are being quoted. This is taken to indicate that the Canadian manufacturers are taking some advantage of the removal of the duty. The demand for hemlock at Boston is rather limited. Good

eastern clipped boards are selling at about \$23.50 and some times at a little less. A fairly uniform price is holding for eastern white cedar shingles at Boston, although the demand is lighter. About \$3.75 is the general figure quoted, with \$3.50 for clears. These prices are apparently being secured by wholesalers when a good brand is required. Red cedars are selling at about \$3.50. Lath are slow at \$3.80 to \$3.90 for 1½ in. A little better demand is reported for 1⅝ in., the price ranging from \$4.40 to \$4.50.

Great Britain

The trade in timber at London is still slow, although considerable quantities of stock are going out of the docks overside and very little decrease is shown in the deliveries from stock. The demand from the building trade is poor, but in other directions consumption is well maintained, the packing trade being the most helpful feature of all, and indicating a brisk export business. Holders are marking time and showing no inclination to dispose of their stocks without profit. Deliveries at London docks for the week ending October 18th amounted to 7,624 standards, as compared with 8,791 standards during the corresponding week of 1912.

Some improvement is reported in the general feeling of the trade at Liverpool, but not sufficient to indicate any wide spread betterment in market conditions. A fair demand continues for yarded stocks. This however, has not improved the price of spruce deals "to arrive," which are lower than they have been this season. The spruce c.i.f. market, so far as cargoes are concerned, is practically at an end and transactions are confined to liner parcels. Prices for these are lower than they were a short time ago and it appears as though the shipments of parcels on consignment to Liverpool were effecting the market adversely. No sales for future delivery are reported. Apparently shippers would not accept, for future delivery, such prices as they are bound to accept for consignments. Stocks at Liverpool and Manchester, as well as the outports, are heavy.

The spot market at Liverpool is easier, but there is nothing in the nature of a slump in price for first-class shipments. The low prices quoted are mainly for Halifax deals brought by liners, a great many of which are of short average length and of low grade, being worth no more than they are bringing. It would not be surprising to see these cheap parcels suddenly come to an end and values regain their normal level. Birch logs continue firm although business is light. Fair prices have been realized for several recent consignment parcels of birch planks. Stocks are ample for the present demand and any extensive arrivals might reduce values.

At Manchester, trade is picking up, now that the stoppage of deliveries at the docks following the strike has come to an end. It will be weeks however, before the effects of the disturbance have entirely disappeared. There is no great rush of orders in the general lumber trade. The demand from builders and contractors is quiet. At Glasgow, trade continues quiet. Stocks in many directions however, are very low. Values on the whole are well maintained.

United States

The feeling of uncertainty as to the immediate future of trade conditions continues throughout the United States. Conditions of a widely varying nature are reported from different parts of the country and business men are expressing just as varied opinions regarding the outlook and regarding actual conditions. Unquestionably, credits are being closely studied and the money market is being watched carefully as an indication of future developments. An encouraging sign is that the banks are not as yet suffering from any lack of funds and there is no indication at present of severe money stringency. The bank clearings however, show a considerable decrease in activity as compared with the corresponding period of 1912. Railroad reports do not show much slowing up. Business men do not seem as yet to have gained a comprehensive view of the ultimate effect of the new tariff measure. In spite of these conditions however, the volume of current business is greater than many expected it to be. Probably, on the whole, there is a greater amount of lumber going into distribution than there was a month ago. Confusion still reigns in the southern pine trade. Business is light and prices are weak and uncertain. The retail dealer and the heavy consumer of lumber are practically getting stocks at their own figures. Logging conditions in many parts of the south are unsatisfactory. The production of yellow pine may be expected therefore to fall off to some extent. An active movement continues in northern pine, the result of many cargoes going forward to their destination before the closing of navigation. Large quantities of lumber for 1914 delivery are being sold in the Duluth district.

Georgian Bay mills have shipped many millions of feet to the Saginaw Valley. An improved demand for white pine is reported from Pittsburgh, especially in the upper grades. Several good orders for shop lumber have recently been placed for delivery during the first half of 1914. Eastern prices on pine are steady, but business is very light.

Gradual improvement is noted in the hardwood lumber trade, the consumptive demand being fairly good. Buying however, is largely characterized by small orders for stock delivery. A little wider de-

mand is noted for the higher grades of oak. The strongest demand is for plain firsts and seconds. Hardwood lumber owners are confident of higher prices in the near future, both in the north and in the south. The leading northern hardwoods are in strong hands. Stocks are low, maple and birch being practically sold up. Prices show no material change. The demand for hemlock continues quite active. Michigan and Wisconsin stocks are reported small. The eastern spruce market is sluggish.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Ottawa Shippers Feeling Car Shortage

Ottawa, November 6; (Special to the Canada Lumberman):—Now that the shipment of wheat from the west to eastern ports is in full swing, lumbermen here as elsewhere are again experiencing difficulty in getting freight cars, with the result that trade is being considerably affected. One local lumberman said this week that he has orders on hand for over one hundred cars of lumber to be shipped to different points, but cannot get it away to suit the convenience of his customers or himself. This is substantiated by others in the trade. There is some talk of appealing to the Railway Commission for redress in the matter, as it is claimed by shippers that hundreds of cars are left idle on the sidings as the result of a lax system of car checking.

Last year, it will be remembered, when the dispute over the shortage of cars came before the Railway Commission, the railways argued that the shortage was principally due to shippers delaying cars. This argument was so effective that an order was issued by the Commission greatly increasing the charge per car on the consignee for every day a car was detained over the free period. This was in effect from December 1st, 1912, to April 1st, 1913. There is little fear, however, that should the matter come before the Commission again this order would be repeated.

Prices of all grades still remain firm. 8-in., 12 to 16 ft. pine shipping culls have advanced \$1, and so has mill run 1-in. x 10-in. The new American tariff has not made much difference so far to trade. Shipments to the United States have not increased to any remarkable extent, but next season its beneficial results will be felt here, according to the opinion of exporters.

All the mills are working with full staffs of men, but it is expected they will close down in about two weeks' time. Most of the men will then, as in other years, leave for the bush.

The Local Master has given a decision in favor of the W. C. Edwards Company in connection with their claim for lumber supplied for the grand stand at Lansdowne Park. The dispute has been in the courts for the past two years, and the Edwards Company is the only firm that has obtained a judgement ordering that it be paid. The amount involved was about \$5,000.

The new pulp mill, recently erected by the E. B. Eddy Company, of Hull, is now in partial operation, turning out about 25 tons of pulp per day. When it is in full operation it will have a capacity of 120 tons daily.

Mr. J. R. Booth, who was seriously injured at his works about a month ago, is slowly recovering. It is doubtful, however, if he will ever be able to visit his plant again to take any active part in the management.

A Moderately Active Market at Montreal

Montreal, November 6; (Special to the Canada Lumberman):—A fair amount of business is passing in lumber. A few wholesalers are busy, but in the main, trade is only moderate. There is a scarcity of spruce and lath, and prices generally keep up. A great deal of building is under contemplation, as may be seen from the building permits taken out for the past month. The total was \$6,765,300, an increase of \$3,918,892 as compared with last year; while for the nine months to date the total was \$22,581,446, a gain of \$6,407,744.

There is a scramble to get lumber shipped to the United Kingdom, as the close of navigation is not far away. Within the last five weeks there has been a large increase in the total sent to Europe, and it looks as if the expected shortage will not materialize. The chief shippers are ahead of last year. The lumber from the Ottawa Valley shows a falling off, owing to the fact that the district is not producing, as it did years ago, such large quantities of lumber suitable for export. Naturally, the exporters have to find other sources of supply, and in consequence the lumber comes by rail instead of by barge. So far, there has been an absence of the congestion at the docks usual at this season, this being due to the small amount of imports.

With regard to the pulp and paper situation, there is a feeling

that there will be, in the near future, a better demand for both commodities. Heavy rains have fallen in New England States, where ground wood is being heavily manufactured. In northern New York, however, the rains have not been so heavy, and the water will not remain high for very long unless additional rains come before frost stops the rainfall. There has been some slackening in the demand for ground wood during the last two weeks, but the winter season will probably take care of the amount which will be manufactured in Canada and any stocks remaining on hand. There is only one mill which has any quantity of old stock.

It is stated that all Canadian news print mills are sold up for nearly all next year. This has had a steadying influence on the United States market, where the high price of wood is a controlling influence on the quotations for paper.

Chemical pulp is in little better request. Prices are no better. United States' conditions have made sulphite rather weak during the last two months. It is reported that European prices are being maintained and in some lines that there will be an increase, as stocks on hand are stated to be limited. The United States Department of Justice is considering an appeal from the Customs' Court decision in the most-favored-nation pulp and paper tariff case. Three million dollars of duties paid from July 26, 1911, to July this year are involved. The Treasury Department have returned a portion of this money to the importers of chemical pulp wood; and should the decision to allow free entry to chemical pulp from Europe during the above period be reversed, the importers will have to repay the duties to the government.

Unsatisfactory Trade at the Tonawandas

North Tonawanda, N.Y., Nov. 7; (Special to the Canada Lumberman): There is little change in the unsatisfactory conditions that have prevailed for more than a month at the local market. Weather is favorable for business and there is the average amount of building in this immediate vicinity. Orders are slow, however, and local wholesalers are curtailing expenses by laying off employees and otherwise conforming to dull times. The favorable weather helps in the receipt of lumber and the local harbor is as busy as usual at this time of the year. There is no hesitation, apparently, to stock up for the future, which is one indication at least that local dealers have hopes of better business in the not far distant future.

A. C. Tuxbury, president of the Northern Lumber Company of North Tonawanda, and of the A. C. Tuxbury Lumber Company of Charleston, S.C., died on October 28th at his summer home in Montclair, N.J. A. C. Tuxbury was several times a millionaire. He started in the lumber business at the Tonawandas about twenty-five years ago. He was 64 years old. His wealth accumulated rapidly and in recent years he became largely interested in timber land on the Pacific coast. During his business and social activity in the Tonawandas the deceased made a hobby of the public schools and gave largely of money, time and effort to developing North Tonawanda high school.

New York Lumber Market Letter

Chase, Talbot & Company, wholesale lumber dealers, in their market letter under date of November 1st, say:—No sooner do we sail safely by the pessimist's storm clouds of tariff revision, than we read the same gentleman's barometer predicting financial difficulties, in consequence of proposed changes in currency legislation. Leading bankers, whom we have interviewed, seem to entertain widely diversified opinions as to the ultimate effect of the currency bill as likely to be amended. There appears to be an even division of those predicting an expansion of credit, and the reverse. However, they are practically all agreed that pending the bill's enactment into law, and for a period thereafter, credits will be curtailed.

The constantly increasing population in the metropolitan district is gradually catching up with the supply of available untenanted

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

homes. Building construction has been considerably curtailed. The receipts of eastern lumber and timber at this port, this year thus far (and the season is practically closed), have been materially less than in any similar period for the past quarter of a century. Yard stocks of lumber, timber, and all building materials are only adequate, because of modest trade requirements. With numerous other markets to feed with eastern stock, our source of supply can only be augmented from the Pacific. What will be the price of lumber in 1914, with expanded credit and normal demand here, as well as in all other sections?

Nova Scotia's Lumber Trade

The United States Consular and Trade reports in a recent issue, referring to Nova Scotia, says:—"The lumbering industry produces probably the heaviest returns of any of this province's enterprises. The total cut in Annapolis, Digby, Yarmouth, and Shelbourne Counties in 1912 was about 80,000,000 feet. Two or three large mills were put in operation in Shelbourne County during the latter part of 1911 and 1912. The best grade of lumber ranged about \$15.75 to \$17 per thousand feet. About 20,000,000 lath were made, selling at an average price of \$2.50 per thousand. Fifteen million feet of lumber were exported, and at the end of the year a considerable amount was still on hand at the mills. The value of the lumber exported was \$267,324, of which \$220,121 went to Argentina and only \$40,000 to the United States. It is estimated that 3,000 people are employed throughout the year in the mills of this district, and this number is doubled during the logging season. There are about seventy sawmills in the four counties, including both stationary and portable equipments, and the average wage is \$30 per month and board or \$1.50 per day without board. Boys receive \$15 per month and board, or \$0.75 to \$1 per day without board. The liquidation of one of the largest mills had a marked effect on the output of the last quarter of 1912.

Barbados Lumber Trade Report

S. P. Musson, Son and Company, Barbados, report upon lumber market conditions under date of October 24th, as follows:—White pine—there has been no arrival during the fortnight, but market is dull, and the receipts which are expected will amply fill requirements. Spruce—there have been no receipts in this either, and dealers' yards are quite full at present. Pitch pine—no receipts. Shingles—We note the arrival of the Schr. "Eddie Theirault" from St. John, N.B., with a cargo of 1,925,500, cedar laying, which had been sold sometime previously at \$2.50, but we understand that owing to poor quality, consignees have been compelled to make an allowance. The Stmr. "Briardene" also brought 944 bbls. for dealer's account. Long Gaspe—dealers are fully supplied and there are stocks in first hands still unsold. Wood hoops—We note the arrival of 800 bbls. for dealer's account.

B. C. Manufacturers Expecting Trade Improvement

A report from Vancouver, B.C., states that the change in the United States tariff is not expected to be of any benefit to manufacturers in British Columbia, at present. Lack of demand for lumber is prevalent on both sides of the border. This condition, however, is not expected to continue for many months, and when improvement develops it is likely that manufacturers in British Columbia will be able to take advantage of the markets of the Eastern States. The cut of logs during the month of September in the coast district was 66,200,421 feet. In September, 1912, the total was 81,675,710 feet. The figures for 1912, however, included those of the island district. This year's figures for the coast district are really only about three million feet less than those of last year. Many operators in British Columbia expect that trade will show a decided improvement after the first of the year.

A Fair Volume of Business at Winnipeg

Reports from Winnipeg, Man., state that a great deal of active work is still in progress in the outside building line. Contractors are doing their best to finish all outside work, so as to permit of work upon the interiors when the cold weather arrives. The volume of business is fairly satisfactory, although it has nothing like the swing which business had at the corresponding period during the last few years. Lumber dealers and producers, who are interested in the Manitoba markets, are expressing confidence that considerable activity will develop next season. They base this view upon general improvement in the business tone which they believe is already becoming evident, and upon the great amount of work that was postponed this year, much of which will be carried out next spring.

Laurentide Company Close Good Contracts

The Laurentide Company have contracted for their entire output of newsprint in 1914 at prices which are more favorable to the company than those under present contracts. Some nine hundred men

are at work on the new power development at Grand'Mere, P.Q., but this will not be completed until the end of next year.

According to a statement by Mr. J. E. Dubuc, managing director, the Chicoutimi, P.Q., Paper Company have orders amounting to \$16,000,000 covering practically the entire output of the mills for the next eight years. The greater part of the output for that period has been contracted for by a large English house, but the company are also large shippers to the United States, the Tidewater Mills of New York, being among the purchasers of their product. The company recently completed the installation of twelve new grinders, and have brought the total capacity of the plant up to 250 tons of dry pulp a day.

Quebec Cullers' Report

The following comparative statement of timber, measured and culled to date, is furnished by the Supervisor of Cullers, Quebec, under date of November 5th:—

	1911 Cubic Feet	1912 Cubic Feet	1913 Cubic Feet
Waney white pine ...	757,840	1,055,200	216,600
White pine ...	10,680	1,760	7,560
Red pine ...	27,720	12,200	960
Oak ...	92,080	109,400	158,800
Elm ...	221,680	276,640	211,520
Ash ...	120	520	1,000
Birch and maple ...	62,320	38,640	47,680

Price Brothers' Business Expanding Rapidly

Price Bros. & Company, it is announced, have newsprint orders on their books for many months to come, and expect to increase their exports to the United States, owing to the alteration in the tariff.

The three paper machines at the Kenogami Mills have been in full operation since May 1st, 1913. These mills, as well as those of the company situated at Jonquiere, are working on contracts to the limit of their present capacity. The cost of manufacturing paper in the new mills is decreasing steadily, while the company is receiving a higher rate per ton for its product. In order to supply power for operating the mills at Kenogami and Jonquiere, the company recently completed a hydro-electric plant at Kenogami, having a maximum development of 25,000 h.p. Electrical energy in excess of the requirements of the mills is sold to the towns of Jonquiere and Kenogami. The present production of the new paper mills can be increased to a daily capacity of 200 tons of paper and 40 tons of cardboard at a very small additional cost.

The following is a comparison of the company's lumber sales for ten months of the present fiscal year and the same period last year.

	1912	1913
Ties ...	\$ 6,419	\$ 42,639
Shingles ...	63,713	138,214
Lumber ...	695,463	777,194

The Pulp Industry in Norway and Sweden

In a recent report to the Department of Trade and Commerce at Ottawa, Mr. C. E. Sontum, Canadian Commercial Agent at Christiania, Norway, makes the following comment upon the pulp industry in Sweden and Norway:—

"The majority of the big North of Sweden timber firms with large forests have already started pulp mills; it is not, therefore, probable that we will witness in the future any such rapid extension of the production in that quarter as that which has taken place in recent years. In Norway the production of mechanical wood pulp cannot be very largely increased, most of the suitable waterfalls being already occupied. And with the growing paper demands of the United States it seems reasonable to anticipate that the Canadian output will, to a very great extent, be gradually absorbed on the other side. But it should not be left altogether out of sight that the relation between supply and demand may be altered in a not very distant future, making it again possible to obtain a reasonable profit.

"It is reported that one of the largest pulp concerns in Norway is seriously considering closing down one of their two mills and selling the power from their waterfall to the Norwegian Nitrate Company. So unprofitable has the pulp industry become of late, that even at this mill, which is one of the most modern in Norway, a question of closing down is raised.

Tariff Effect Upon Eastern Newsprint

In the opinion of Mr. J. A. Aver, the Montreal manager of the Laurentide Company, the United States tariff act will result in 100,000 more tons of Canadian newsprint being shipped across the border. The removal of the duty will be of benefit to the Laurentide and other companies operating in Quebec, inasmuch as many Quebec mills have been paying the old duty of \$5.75 a ton, owing to the great bulk of their paper having been made of lumber cut from Crown lands,

Fancy Woods and Veneers

THEIR ORIGIN, VALUE AND
USE—COMMENT AND VIEWS
ON AN IMPORTANT BRANCH
OF THE TRADE.

Why Are Canadian Hardwoods Neglected?

Editor Canada Lumberman:—

Toronto, Oct. 23rd.

It is very peculiar that in the United States a large proportion of the high-class furniture is made from birch. When you come over into Canada you find that the Canadian trade, when they want high-class goods, apparently must have either oak or mahogany. What is the reason for this difference?

Our firm does business in the United States at the present time with one concern that manufactures nothing but high grade parlor furniture. About one-half of their stock is manufactured from the upper grade of birch and they maintain that the price for this stock does not come very far short of the price they receive for their mahogany goods. In fact, upon examination, it is frequently difficult for anyone but an expert to distinguish one from the other. The interior finish of a large proportion of American buildings is made of high grade birch and brown ash, whereas in Canada they stipulate almost invariably that they must have quartered oak or mahogany, and they object very strongly to paying a price for high grade ash that is on a par with good oak. Anyone who takes the trouble to examine two buildings finished in these different woods, ten years from the time when they were put in, cannot fail to be struck with the fact that the appearance of the ash has improved and that that of the oak has gone back. The natural qualities of ash are in the beauty of the wood, whereas the beauty of oak can only be brought out by the material put on to finish it. The average person examining an American job of finish in birch, who is not familiar with the work, would be very apt to call it cherry, whereas very frequently in a Canadian job of birch he might call it white pine painted red.

Who is Responsible?

A great deal has been said about it being unfortunate that Canadians are sending their woods out of the country, but if these same Canadians would stop to consider for a moment the class of material that they have at their own doors, they could build up and improve the situation at home by using these woods, thus benefitting the people of Canada and creating trade in the country which produces trade for them. These features are just as noticeable in connection with the consumption of hardwood, as the competition of yellow pine is noticeable to the producer of soft woods in Canada. A great many people will state that a large portion of the high grade finish and furniture work is made from veneers. Granting that to be true, it might also be said that you can get just as high a grade of birch veneers from good logs in this country as any other veneer. I do not think that anyone will question the statement that the veneer taken from a curly birch log will stand on a par with any quartered oak veneer ever produced. Why can we not utilize these curly birch veneers instead of importing the fancy Circassian veneers that we see being used in this territory to-day. Some of our consuming trade tell us that the reason they are using it is that it is so difficult to make birch stand up, that is, to get it in shape, as to dryness, so that it will work properly. If any man will take the same trouble to prepare his birch that he takes with his oak, he will find that it is just as easy to put it into shape for working and that it will stay when it is put there. Too frequently we find our trade buying lumber that is probably two months cut and putting it into the kiln for a few days, then wanting to rush it into a job. The consumer must realize that kiln drying on any green lumber is not beneficial and that he cannot expect to put this stuff through the kiln with any success until it has had a reasonable amount of air drying. One of our customers in New York City stated to me recently that he never put any birch into the kiln until it was a year dry and that he was highly pleased with the results he had obtained from birch and had never had any trouble with it.

Birch a Splendid Piano Material

Another class of trade that with very few exceptions in Canada has fought shy of birch is, the piano trade, whereas I am aware from personal knowledge that a large number of the American piano manufacturers are using considerable quantities of birch in their pianos. In fact, one of the American manufacturers, which has a reputation for producing one of the highest grade pianos in the world, is a large consumer of birch. There seems to be no reason therefore why the Canadian piano manufacturer should not use birch a great deal more extensively than he is at the present time.

With the flooring trade of Canada in the prosperous conditions that it is in to-day, there seems to be no reason why—and I do not believe there is any reason why—the total output of the lower grades of birch cannot be marketed to the flooring manufacturers in Canada.

With recognition from the furniture manufacturers, planing mill and trim manufacturers, piano trade and implement and carriage trade, there seems to be no reason why all of the product of Canadian birch could not be used at home, thus improving and stimulating the lumbering industry of this country. There is no doubt whatever that stimulating home industries in these lines must of necessity improve the trade situation for all these consumers. It is a well recognized fact now that the main hardwood supply of Canada is birch. With the home market stimulated in this manner, the manufacturer of birch would be encouraged to a greater extent and would develop his industry, thus giving employment to a larger number of people in Canada.

On nearly all the cut-over limits in Northern Ontario to-day there is a large amount of timber that is being left and destroyed by fire. Much of this is good birch and it is being wasted because the market in Canada is not extensive enough to take care of it and the average small manufacturer cannot afford to go to the larger market to the south to make his sales. This stock should have been cut when the other stocks were cut, but there was no market then.—Wholesaler.

Birch the Leading Canadian Hardwood

The popular idea that because Canada is the Land of the Maple, the maple must necessarily be the hardwood of first importance in Canada is incorrect, judged by the data gathered by the Forestry Branch of the Department of the Interior at Ottawa.

There are three species of birch of commercial importance in Canada, the black, yellow, and white, or paper, birch. The former two have the more valuable wood, but are confined to eastern Canada, whereas the paper birch is found in every province of the Dominion, ranging to the limit of tree-growth towards the north and growing well within the Arctic circle in the Mackenzie River basin and in the Yukon.

It is this wide range which contributes largely to its present importance, but the qualities of the wood promise a still greater use in the future, for it is a strong, hard, fine-grained wood which takes a high polish and can be stained to imitate the more expensive woods, such as mahogany, cherry or walnut. "Wavy" birch is an accidental form due to cross-grain, somewhat similar to "curly" maple, and is highly prized for ornamental work. In another recent report issued by the Forestry Branch on the Wood-Using Industries of Ontario, birch is reported as being used in the manufacture of over one hundred different articles, ranging from ships to spoons. As a fuel-wood, it takes first place and it is also one of the principal woods used in wood-distillation, while its only objection as a pulpwood is that it is too heavy to be readily floated down the streams to the mills.

Birch also formed 28 per cent. of the square timber exported from Canada in 1912, according to the bulletin on the production of lumber, square timber, lath and shingles for that year, which has been prepared by the Forestry Branch and will shortly be issued. The remainder was largely white pine. Until 1912 the export of square timber had steadily decreased since 1877, but last year showed a surprising increase, the quantity exported in 1912 exceeding that exported in the previous year by almost 90 per cent.

An event of much interest at Thorold, Ont., was the recent arrival of the steamer Glenfoyle, carrying a cargo of 2,500 tons of sulphite pulp from a Norwegian port direct to Thorold without breaking bulk. This is the first of a number of cargoes to be imported by Nilsen Rantoul & Company, Inc., who have offices at Christiania, Norway and New York. The first shipload of news print ever sent from Thorold by water was also despatched recently direct to Chicago when the steamer Bennington loaded some 1,200 tons of paper from the plant of the Ontario Paper Company.

By the installation of a new machine, the Wayagamack Pulp & Paper Company, Shawinigan, P.Q., are adding ten tons of Kraft per day to the output, making a total of sixty tons per day. There is still an active demand for the company's product. The lumber mills have an output of about 100,000 feet a day, while beginning about March 1st next the company will have a surplus of about fifty tons of pulp a day to market.

Imports of wood and timber into Great Britain for the nine months from June to September during the past three years were valued as follows:—1913, £25,125,244; 1912, £20,144,807; 1911, £18,880,008. The increase for 1913 over 1912 was therefore £4,980,437, and the increase for 1913 over 1911 was £6,245,236. These figures relate to the c.i.f. values of the articles imported.

THE PIONEER MAHOGANY MILL OF CANADA

Mexican and African and Cuban Mahogany, English Oak

This is the most up-to-date Mahogany mill in America, and we are manufacturers of all kinds of fancy woods, viz., African, Cuban and Mexican Mahogany, teak, English oak, padouk, circassian, and Italian walnut, and others. Also all kinds of veneers, rotary, sliced, and sawed in all woods.

500,000 feet good dry mahogany ready to ship, all thicknesses, well manufactured and best quality wood. Send us your requirements and we will cheerfully quote.

Dominion Mahogany & Veneer Company

Montreal West, P.Q.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

1298. **Lumber, white poplar.**—A South African firm of importers would like to correspond with Canadian exporters of lumber. Sizes as follows: $\frac{1}{2}$, $\frac{3}{8}$ and 1 inch thick; 12 to 18 inches wide; 12 to 16 feet long, in the rough.

1311. **Machinery, sawing.**—A South African firm of general merchants requires catalogues and prices on sawing machinery of Canadian manufacture.

1331. **Woodenware.**—Catalogue and prices are required by a South African importer on Canadian manufactured woodenware.

1345. **Handles.**—Catalogues and prices are requested by a Cape Town firm of commission agents on Canadian-made handles of all kinds. Prices to be f.o.b. Canadian ports.

1356. **Woodenware.**—A Cape Town firm of wholesale importers desires quotations, catalogues and samples if possible on Canadian-made woodenware. Prices to be f.o.b. Canadian ports.

1358. **Handles, all kinds.**—Catalogues and f.o.b. prices on Canadian-made handles of all kinds are desired by a Cape Town firm of hardware importers.

1359. **Broom handles.**—Samples and f.o.b. prices are requested on Canadian-made broom handles, $1\frac{1}{8}$ and $1\frac{1}{4}$, by a Cape Town firm of wholesale dealers.

1366. **Lumber.**—A Natal firm of carriage builders requests quotations on poplar planks, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$ and $\frac{7}{8}$ plained on both sides, 12, 14, 16 and 18 inches wide, from 8 feet in length up. Quotations must be for best only.

1378. **Woodenware.**—Catalogues and prices are requested by a Natal firm on Canadian manufactured woodenware.

1381. **Handles, all kinds.**—A Pietermaritzburg firm requests catalogues and prices on all kinds of handles of Canadian manufacture.

1387. **Woodenware.**—A South African firm of general importers requests catalogues and prices on Canadian-made woodenware.

1388. **Handles.**—A Johannesburg firm asks for catalogues and prices on Canadian-made woodenware.

1396. **Handles, all kinds.**—A Johannesburg firm requests prices and catalogues on Canadian-made handles of all kinds.

1397. **Woodenware.**—A Transvaal firm of general merchants asks for catalogues and prices on Canadian-made woodenware.

1401. **Poplar boards.**—A Johannesburg firm of importers requests quotations on best quality only, poplar boards $\frac{1}{2}$ inch and $\frac{5}{8}$ inch thick, 24 and 26 inches wide; $\frac{7}{8}$, 1, $1\frac{1}{8}$ inches thick, 12, 14, 16 wide, planed.

1404. **Handles.**—A South African importing house asks for catalogues and prices on Canadian-made handles.

1407. **Pine boards.**—A Johannesburg firm requests quotations on clear pine, width 12 inches up, length 12 to 16 feet, and from 1 inch to 4 inches thick, in the rough.

1408. **Pine Shelving.**—A Johannesburg firm requests quotations on pine shelving, second quality, 1 inch by 12 wide. Length 12 to 16 feet.

1409. **Poplar Shelving.**—A Johannesburg firm requests quotations on poplar shelving, second quality, 1 x 12 wide. Length 12 to 16 feet.

1410. **Spruce Shelving.**—A Johannesburg firm requests quotations on spruce shelving, second quality, 1 x 12 inches wide, length 12 to 16 feet.

1413. **Handles, all kinds.**—A Johannesburg firm requests prices and catalogues on handles of Canadian manufacture.

1428. **Veneered chair seats and wall panels.**—A commission agent would accept representation for Paris and France of these specialties in veneered wood.

1447. **Handles, all kinds.**—Prices and catalogues are requested by a South African firm of whole importers.

1449. **Woodenware.**—Catalogues and prices are requested by a Transvaal firm of wholesale importers.

1466. **Handles, all kinds.**—A South African firm of general importers requests catalogues and prices on Canadian-made handles of all kinds.

1474. **Woodenware.**—A South African importer requests samples and prices on Canadian-made woodenware.

1478. **Handles, broom.**—A South African firm of importers requests prices and correspondence on Canadian-made broom handles.

1479. **Handles, all kinds.**—Correspondence and prices requested on all kinds of handles, by a South African importing house.

1496. **Handles, all kinds.**—Catalogues and prices are requested by a South African importer.

1498. **Woodenware.**—A South African importing house makes inquiry for catalogues and prices on Canadian-made woodenware.

1514. **Woodenware.**—A South African firm would like to correspond with Canadian manufacturers and exporters of woodenware.

1515. **Handles, broom, pick and tool.**—A Bloemfontein firm requests prices and catalogues on these commodities, of Canadian manufacture.

1530. **Lumber, pine shelving.**—A Bloemfontein importer solicits correspondence on pine shelving.

1538. **Handles, all kinds.**—A South African house makes inquiry for catalogues and prices on all kinds of handles.

1551. **Lumber.**—A South African importing house would be pleased to receive correspondence on Canadian lumber. Prices requested.

1554. **Machinery, sawing.**—Inquiry is made by a South African firm for catalogues and prices on Canadian sawing machinery.

1558. **Pine shelving.**—A South African firm requests correspondence and prices on Canadian pine shelving, second quality, 1 inch x 12 inches wide, 12 feet to 16 feet long.

1597. **Maple skewers.**—A South African firm dealing in butchers' supplies only, requests samples and quotations on maple skewers, 6, 7, 8, 9 inches.

1598. **Maple blocks.**—A South African importer of butchers' supplies asks for quotations on Canadian maple blocks.

1606. **Pine shelving.**—A South African importing house asks for quotations on pine shelving, quality No. 2, 1 x 12 wide, length 12 to 16 feet.

1689. **Broom handles.**—A South African firm of importers would like to communicate with manufacturers and exporters of broom handles $1\frac{1}{8}$ and $1\frac{1}{4}$.

1713. **Packing cases.**—A London firm desires the addresses of Canadian lumber firms who export empty packing cases (boards packed flat ready for erection on arrival). These are required for shipment to India.

600 Sets Payette's Famous Patent Mill-Dogs Sold

Why?

Fig. 1.

- Because (1) They will dog with perfect ease and safety in any class of timber.
(2) Will dog just as easily, frozen maple or hardwoods of any description.
(3) Will dog the last board, just as easily as they dogged the first one.
(4) They do not tear the board or stock.
(5) Many other reasons, too numerous to mention here.
Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery;—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer; P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves. Five different class and style of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.

Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.

Descriptive Booklet and prices mailed free upon request.

Veneer Machinery

THE "MERIT" LINE of Veneer Cutting, Dimensioning and Drying Machinery is designed first, for veneer mills cutting high grade furniture and commercial veneer from expensive timber, and second, for basket, crate, box and barrel factories using cheaper veneer cut from the less expensive woods.

Merit Veneer Lathe

In addition to Lathes, Clippers, and Driers, the line, includes Knife Grinders, Log Hoists and Trolleys, a set of Crate Head Machinery, a set of Barrel and Basket Hoop Machinery, Basket and Hamper Bottom Rounders, Nailing Forms, etc.

**Not altogether what we
say but what users say**

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs,
in calm weather, 30,000 in a head wind.

OPPORTUNITIES

WE own and offer for sale on attractive terms a few especially well selected tracts of timber running from 50 million to one billion feet that are ready for immediate operation, having a good local demand at high prices.

The timber on the Pacific Coast is the last stand of the the great forests. Well selected timber in British Columbia is the best investment on this Continent and offers especially attractive inducements for manufacturers.

EDGINGS

Ontario

The Canadian Flax Mills, Limited, Drayton, Ont., are now operating the new hockey stick plant which they recently erected.

The Beverley Wood Specialty Company, 91 Niagara Street, Toronto, Ont., are contemplating the erection of a woodworking factory.

A Furniture Exhibition showing the product of the Canadian Furniture Factories is to be held at Exhibition Park, Toronto, during January next.

Work has been commenced at Wyoming, Ont., upon the erection of a box factory for Daniel Senecal, who is also in the market for sawmill machinery.

The Lusty Lumber Company, Rodney, Ont., have installed a portable mill to cut out the stock which they had on hand when their mill was destroyed by fire.

The annual report of the Lake Superior Paper Company for the year ending June 30th shows that profits available for interest charges and dividends amounted to \$184,178 which average \$5.40 per ton.

Timber berths Nos. 6 and 8, Merrick township, having an area of 8¼ square miles, and berths Nos. 1, 2, 3, 4, 5, 7, 8 and 9 Hammell township containing an area of 27½ square miles are advertised for sale by auction at the New Russell Hotel, Ottawa, on December 1.

The A. M. Shaw Company, Limited, Fort Frances, Ont., has been incorporated with capital stock of \$30,000 to carry on business as timber merchants, sawmill owners, etc., with head office at Fort Frances. The provisional directors are A. M. Shaw, lumberman; M. J. Nolan, manager; and A. E. Carterm, merchant, all of Fort Frances.

Good progress is reported in connection with the installation of the plant of the Fort Frances Pulp & Paper Company at Fort Frances, Ont. The president of the company is Mr. E. W. Backus, the well-known Minneapolis lumberman. It is expected that the plant will be on a producing basis by January 1st. The equipment will include two 186-in. Fourdrinier paper machines, with a capacity of 150 tons of news print per day, in addition to 15 grinders and 12 wet machines.

The Appellate Division at Osgoode Hall, Toronto, has dismissed the appeal of Henry Wise, lumber merchant, of St. Catharines, from the decision of the County Court Judge at Barrie, dismissing his action against John Richardson, of Fergusonville, and Alfred Archer, of Elmvale, councillors of the township of Flos, to recover damages for the burning of a quantity of timber belonging to the plaintiff. Mr. Wise alleged that the fire was due to a bonfire set in the highway by the defendants for the clearing up of a quantity of underbrush.

Eastern Canada

The saw mills of McFaul Bros. and P. and A. McGibbon, Lachute, P.Q., have been closed for the winter months.

The St. Martin Lumber Manufacturing Company, Limited, has been incorporated, with head office at Saint Martin, P.Q., and capital stock of \$49,000.

The Belgo-Canadian Pulp & Paper Company, Shawinigan Falls, P.Q., are installing a sulphite plant, to be followed in 1914 by one paper machine, and by a second paper machine in 1915.

The Sash and Door factory belonging to L. P. Roger, at Pont Viau, P.Q., was recently destroyed by fire, the loss amounting to \$6,000 which was covered by insurance. The owners will rebuild.

Fraser & Company, Limited, the well-known lumber importers on the St. John River in New Brunswick, are considering a proposal to build a pulp and paper mill at Edmundston on the St. John River.

The Grand Trunk Railway Company announce that they will soon establish a forestry department similar to that of the Canadian Pacific Railway Company. The principal objects will be to insure a better supply of ties and to promote forest preservation.

The Napierreville Lumber Manufacturing Company, Limited, has been incorporated with, head office at Napierreville, P.Q., and capital stock of \$49,000. The incorporators include J. E. A. Decelles, Montreal, A. Cyr, A. P. Beaulien, A. Vinette and W. Perrier of Napierreville.

Louis J. Ferland & O. Ferland, door and sash manufacturers, of L'Ephiephanie, P.Q., have entered an action against the Leval Electric Company for \$9,872, damages caused to their factory by fire owing, they allege, to the defendants failing to provide switches in connection with the installation of an electric motor.

The Thurso Manufacturing Company, Limited, has been incorporated, with head office at Thurso, P.Q., to manufacture chairs and furniture of every sort and to sell and deal in lumber, doors, sashes, etc. The capital stock of

the company is \$49,000 and the incorporators include J. E. A. Decelles, G. W. St. Arnaud and J. A. Hamelin, all of Montreal.

The Scroggie Furniture Company, Limited, has been incorporated, with head office at Montreal and capital stock of \$100,000. The rights secured by the company include the manufacture of all kinds of furniture and doors, sash, blinds, shingles, office fittings, etc. The incorporators include A. Wainwright, K.C., M. Alexander, C. Sinclair and D. Burley-Smith, all of Montreal, and J. L. Lawrence, of Westmount, P.Q.

Bondholders of the Chicoutimi Pulp Company have passed a resolution authorizing the exchange of their holdings, which bear 5 per cent. interest, into bonds of a new 6 per cent. issue to be made by the company. Of \$2,000,000 to be issued immediately, approximately \$1,200,000 will be required for purposes of exchange with the old issue and the balance will be available for sale to raise money for plant extensions.

A proposal for the establishment of pulp and paper mills at Three Rivers, Que., is being talked of among paper men at Montreal. It is stated that since the new tariff was decided upon, a syndicate representing a powerful group of American capitalists has been quietly at work securing options for the establishment of a pulp and paper plant at Three Rivers, which will be among the largest in the Dominion. No names are mentioned, but the statement is that certain Montrealers will be identified with the enterprise.

The announcement, in the Canada Lumberman of November 1st, of the incorporation of the firm of W. & J. Reg. Sharples, Quebec, P.Q., referred to provisions which were made by Mr. Wm. Power to continue the firm under its old name. Readers of the Canada Lumberman will recall that Mr. Power's two partners, Hon. John Sharples and R. Harcourt Smith passed away during the present year, leaving Mr. Power the sole surviving member of this old established firm. The firm was established in 1816 and Mr. Power has been connected with it for over a half a century.

The Grand Isle Lumber Company owned by Stetson, Cutler & Company, Boston, Mass., which lost its mill by fire last June, has now acquired control of the Van Buren Lumber Company plants at Van Buren, Me., which it will operate in the future, using these plants in the place of those which were burned. The mill which was destroyed by fire was located about sixteen miles above Van Buren on the St. John River. The new owners will renovate the long lumber plant, putting in new boilers and new double cutting band mill, together with a full equipment of other modern machinery. The shingle plant will not be altered.

Western Canada

A sawmill to cost \$100,000 will be erected near Prince Rupert on the line of the Grand Trunk.

The Howe Sound Timber Company is preparing to open a new body of timber and may install a cable way.

Foley, Welsh & Stewart will build a small mill near Newport at the head of Howe Sound, in order to take out their own ties and bridge timber for the construction of the Pacific Great Eastern Railway.

The Haslam Lake Timber & Logging Company is making good progress with the construction of its ten-mile railway into its limits up the coast. It will be able on this account, to operate extensively after the first of the year.

A project is under way for the establishing of a furniture factory in Saskatoon, Sask. Frank Giddings, who has had a long experience in this work is behind the proposition. Plans for the proposed buildings are in the course of preparation and it is understood that some eastern capital is interested.

The B. C. Hardwood Floor Company, Limited, has been incorporated, with head office at Vancouver, B.C., and capital stock of \$10,000. The rights of the company include the carrying on of business as timber and lumber merchants, saw and planing mill proprietors, etc.

The Western Pine Lumber Company, Grand Forks, B.C., are making plans to take out 10,000,000 feet during the coming winter, as they expect improved business conditions next year. The company's limits are located in the boundary district, where logging is carried on altogether in the winter.

The Empire Lumber Company, the New York concern which recently commenced operations at Cowichan Lake, B.C., lost \$5,000 worth of steel cables and logging machinery when a scow capsized recently while crossing the lake in tow of a tug. The lake is too deep to permit of recovering the equipment.

"Independent Investments Limited" have been incorporated with head office at Winnipeg and capital stock of \$20,000. The rights of the company include the operation of timber limits and the manufacture of all kinds of lumber. The incorporators include W. J. Donovan, A. M. Doyle, J. Christopher-son, G. B. Murphy and A. H. Machon, all of Winnipeg.

The Cannon Lake Lumber Company, Limited, has been incorporated, with head office at Winnipeg, Man., and capital stock of \$100,000. The incorporators include P. P. Elliott, Fort Frances; W. L. McIntosh, A. C. Miller and B. C. Deacon, all of Winnipeg. The rights of the company include the carrying on of logging, and lumber manufacturing business in all its branches and the manufacture and sale of pulp and articles manufactured from pulp.

Our Price List for November is just out

This includes

1" and 2" Spruce
1" and 2" Hemlock
1" to 3" White Pine
1" and 2" Red Pine
1½" Spruce and Hemlock Lath

The cut of lumber offered is of an excellent quality and is of good value.

If you have not a copy, notify us.

You will find this price list of great assistance in making your purchases and the stock of more value in helping you finish a good year.

Kent's Cordwood Splitter

1. Conveyor of logs to saw.
2. Steam hold down.
3. Cut-off saw.
4. Conveyor from saw to splitter.
5. } Steam piston.
6. }

7. Steam head block.
8. Can be used as friction drive to carry wood out.
9. Vertical splitter.
10. Adjustable horizontal splitter.
11. Delivery table.

THE expensive operation of splitting cordwood has been reduced 50% in cost. Every kind of timber no matter how crooked or knotty can be easily split by the Kent Cordwood Splitter.

Cut-over limits may be turned into good profit. The splitter can be set up in the woods and while your Winter operations are in full swing—roads made and equipment running—you can send all logs unfit for lumber to the Splitter where they will be quickly made into cordwood ready for shipping.

If the splitter is used in the woods a boiler of the 35 h.p., 90 lbs. or more working pressure will supply ample power. If in the yard a 2" pipe line from boiler plant will run the Kent Cordwood Splitter.

The Correct Belt for Every Kind of Drive

Use Scandinavia

- On your main drives and on all direct drives whether straight or crossed.
- On wet drives, provided belting stays wet.
- In places where it is hot.

Scandinavia has good surface for clinging to the pulley, runs true, is flexible and enormously strong.

"Circumstances alter cases" when choosing the right belt to get longest and best service. Write us about your belting problems. We can save you money. Send to-day for copy of THE MAIN DRIVE.

Use Lanco Balata

- Where the conditions are constantly changing from wet to dry.
- Where belt must run under extremely cold conditions.
- Where you want an endless belt.

Lanco Balata will stand up under high speeds. It is impregnated with pure balata gum ensuring the highest service giving quality.

Toronto

Federal Engineering Company, Limited

Montreal

When You Overhaul Your Mill

THERE are wet places in every saw and pulp mill where nothing but the highest class belting can "make good." It is for these wet places that recommend what most mill-men swear by—our

"ACME WATERPROOF" BELT

This belt is especially made for a rough and trying service. It has less stretch than any other belt by 15 to 25 per cent.

When you are overhauling try a Goodhue "Acme Waterproof" belt. Other Goodhue belts are "Extra" and "Standard."

Prices and Particulars on Request.

J. L. Goodhue & Company, Limited

DANVILLE - QUEBEC

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

by using our

Patent Steel Band Mill and Carriage

Results from logs of given dimensions cut on Breeze Denison & Co. pat. band mill.

Diam.	Log Length	Feet Lum.
8in.	16 ft.	45
10	12	51
10	16	69
11	15	96
14	16	171

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

FAY-EGAN
"LIGHTNING" No. 9

Ball Bearing Band Saw Mill

—the mill that produces big results—the mill that can be taken to and set up where a big band is impossible—the ideal mill for small and changing operations.

Don't waste 20 per cent. of your lumber on a circular mill—put in a ^{FAY-EGAN}"LIGHTNING" No. 9—50" Ball Bearing Band—Save lumber—Save power—and get a greater output of better sawn lumber that will bring you a higher price.

Write today for further information. Of course, we make larger mills and we will be glad to tell you about them, too.

TORONTO

The Shimer "Limited" Cutter Heads

WITH EXPANSION

will match flooring at the rate of 150 to 180 lineal feet per minute. Special features enter into their construction to enable them to withstand the enormous centrifugal strains, and to cut clean and easy at fast feeds.

They are self centred on the spindles by means of a chucking device which grips firmly thereto when drawn up, making a perfect fastening and one that insures all the cutters doing their share of the work.

If you have a machine that will swing these Heads and will feed up to 150 to 180 lineal feet per minute, we advise their purchase.

Price, net, for Flooring, \$72.46 the set complete like illustrations. In Solid Section, \$67.00 complete.

SAMUEL J. SHIMER & SONS, Galt, Ont., Can.

**"THEY SURE DO RUN
UNIFORM"**

A Michigan saw filer of many years' experience says this about

Aloxite Saw Gumming Wheels

*His tests and his results
prove it*

He finds that they cut fast and clean without burning—that they hold their shape—show long life and are positively uniform in grit and grade. ¶ A study of saw-filing requirements and conditions enables our service department to put

*The Right Wheel in the
Right Place*

You Get Real Service Out Of

THE first successful Band Saws operated in this country were employed in the Disston Works. In 1876 the Disston Works exhibited 6-inch Band Saws at the Centennial Exposition which were so far ahead of the times that they were looked upon as curiosities.

This spirit of progress has been steadily maintained at the Disston Works. The quality of both the steel and the workmanship—always the best—has rapidly advanced with the requirements of the growing lumber industry. To-day there is no section of the world where lumber mills are operated that you do not find the most successful mills depending upon Disston Saws.

Our Handbook is the greatest authority on the use and care of saws. Have you a copy? Free to millmen.

Choose the PRACTICAL Method

Don't misunderstand. Theory must not be scorned. Supposedly wise men called Columbus crazy because of his theory. His theory that the world is round was correct, but correct as it was, it didn't accomplish what he sought, namely, a shorter route to India.

We believe the theory of untreated belts to be based on facts determined honestly and by serious men, but we don't believe in the long, troublesome, inefficient route. We admit that tight untreated belts do work. We know that you can sail from Spain to India via America.

Since a Cling-Surface treated belt will do more work, will do it more efficiently, more dependently, and with much less attention and worry on the part of the engineer than will a tight belt, we are wholly justified in calling ours the most practical method.

Run your belts slack or easy. Save the coal and energy you are needlessly wasting in bearings. Save the expense

Cling Surface Co

1021 Niagara St Buffalo N Y
New York Boston Chicago Denver
Atlanta Memphis Toronto Etc 50

A collection of Abstruse Formulas and curves prepared by scientists for belt users.

$$[2\sqrt{t_0} - \sqrt{t_2} + 0.4c^2 \left(\frac{t_2^2}{t_0^2} + \frac{1}{t_2^2} - \frac{2}{t_0^2} \right)]^2$$

of taking up your belt every time you hear it slip and squeal. Save your belts; don't allow them to crack, chafe and break when a preservative treatment as reliable and effective as Cling-Surface is so easily obtained. Also waterproof your belts with Cling-Surface.

We have literature containing valuable curves and facts for you. Get it. Take advantage of our liberal offer at once. Quotations are f.o.b. Toronto.

SAMUEL C. ROGERS & CO. 18 LOCK ST. BUFFALO, N. Y.

Your Friction Load

represents the proportion of the power you are paying for that is used in wearing out your machinery.

Dixon's Flake Graphite

is friction's greatest foe, because, when fed to a bearing with oil or grease, it forms upon the bearing surfaces a permanent, almost frictionless, veneer-like coating which is fully effective in keeping the surfaces apart. A sample sufficient to prove this may be had free on request, with a copy of "Graphite as a Lubricant"—No. 238.

WHY you should install the **Mahony Blower** System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses $\frac{1}{2}$ less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

Getting Acquainted

THE best method we have for "getting acquainted" with a man is through a Leviathan Belt. When he has put that belt into use, and watched it day after day—then we know each other better; he has faith in us and our goods—especially if he compares his "Leviathan" with some other belt.

Knight

Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk 3 feet by 6 feet 3 inches
Diameter and Length Mandrel . . 2 3/16 by 55 inches
Size Drive Pulley 20 by 10 inches
Feed per Revolution of Saw 0 to 3 1/4 inches
Feed Belt 4-inch Gandy
Largest Diameter Saw 56 inches
Length of Carriages 12, 16, 20 or 24 feet

Width of Carriages 33 inches
Trucks 7-inch wheels and 1 1/4-inch axles
Length Track 32, 40, 48 or 56 feet
Style and Opening of Blocks Cl-36 inches
Style Mill Dogs Pony Excelsior
Style Set Works No. 1 Single Ratchet

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes or tightener and foundation bolts for husk.

Circular Slab Resaws

Made with either wood or iron frames in three different types, all built for 40" saws.

They are all instantly adjustable for slabs of any thickness up to four inches, and the saws are easily adjusted for making lumber of different thicknesses.

We also build resaws for special requirements such as cutting up short ends of boards and slabs into box boards.

May we send our Resaw Bulletin?

William Hamilton Company, Limited

Peterborough, Ontario

THERE'S A BERLIN BAND FOR EVERY PURPOSE

On Berlin Band-sawing machines are improvements that cannot be bought elsewhere at any price.

And in the Berlin line of Band Rip and Resaws there's a machine especially adapted to whatever work you want to do.

For resawing cants or planks or slabs, or ripping any kind of stock there's a Berlin to do it at the lowest cost to you.

Equip your mill with Bands of one make, head mill to Ripsaw. Install machines of similar design with similar operating devices. Then any operator can work well with any Rip or Resaw in your mill without any "breaking in."

Each Berlin Band is adapted to certain work. The close-coupled resaw with short, stiff blade and powerful feed works will take all the cants dropped to it by two Band mills.

Low Production Cost

The Twin Horizontal with hopper feed, with its continuous cut, has a daily output of 45,000 board feet.

The Band Rip combines quick, accurate operating with fast feeds and lowers production cost of ripping molding, flooring and special stocks.

There's a Berlin Band working near you, under conditions similar to yours. See it in operation. Talk with the owner. Ask for his name and address.

This Band Saw catalog illustrates and describes the line complete.

Write for it Today

WATEROUS LOG JACKS

For Steady Continuous Service

On the reliable and uninterrupted working of your Log Jack, a great deal of the successful operation of your Mill depends.

A break in the Log Jack means a shut-down in every department. To overcome this possibility Waterous Log Jacks are built with an exceptionally large factor of safety in every part, and are designed to make repairs quick, cheap and convenient.

Our patterns cover ten distinct styles. Sizes suitable for the most exacting service in all sizes of mills ranging up to the largest mills of the Pacific Coast can be supplied.

For the Heaviest Work we recommend the No. O Log Jack shown above. This double geared machine carries a bull wheel 60 ins. in diameter, has a $5\frac{7}{8}$ ins. main shaft and is built throughout to these proportions. It can be arranged to drive lengthwise or crosswise of mill for Band or Circular Mill work, and is the heaviest Jack we build. Weight 5700 lbs.

For Light Mills cutting from 15,000 to 20,000 feet per day, the No. 2 Log Jack as shown in the smaller cut, is the best buy. The full web bull wheel is $35\frac{1}{2}$ ins. in diameter, $3\frac{1}{2}$ ins. wide; main shaft $3\frac{3}{4}$ ins. in diameter. Can be supplied in double or single geared machines, to drive lengthwise or crosswise of mill. Weight 900 to 1500 lbs.

A clear concise description of these Log Jacks is contained in special bulletin No. 109. Send for it.

GREAT STRENGTH AND DURABILITY

Dick's Balata Belting, the best known fabric belt in the world, is specially distinguished for great strength and durability. Most gratifying results have been obtained from Dick's Belts as regards retention of strength. There are cases on record where Dick's Belts have been running for over twelve years and not only have retained their strength, but show not the slightest signs of wear and tear.

Write for Catalog on "Transmission Appliances."

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |

"Brazel Patent" SNOW PLOWS

Known in every
Camp from the
Atlantic to the
Pacific as the
most satisfac-
tory Snow Plow
made.

Combination
Model, Lumber-
man's Snow
Plow, can be
used either with
or without Rut
Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9' wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. Brazel Plows cut 6" wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fills up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12" of loose snow each time the plow passes over.

Try pulling this Belt apart

That will give you some idea of the enormous strength built into Goodyear Belts. Not an ounce of untested rubber is used, not a roll of untested duck. Each finished Belt is inspected before shipping *to make sure* that it will stand the *wear* and keep *pliable*.

The Goodyear system of Belt making is calculated to give the greatest efficiency in practical Belt Service.

A close, clinging grip of the pulleys—absolutely non-slipping. Goodyear Rubber Belting gives this cohesive contact because of its yielding rubber surface, and the practical result is an immense saving of power.

Pliability under all conditions. A belt must be pliable to grip the pulleys. The hard cotton fibre of Goodyear Belting is permeated—under tremendous pressure—with rubber. The treated layers are compressed into an homogeneous mass. This preserves the pliability of rubber in the finished Belt.

Entire absence of "stretch." The "curing" or vulcanizing of Goodyear Belting is performed whilst the Belt is stretched to the limit of safety in a special machine. "Stretch" in service therefore is impossible. This means no stopping of machines for adjustment—no idle machines, no idle men.

Enormous strength. The union of carefully tested hard-fibre cotton with tenacious and elastic rubber "friction"—compressed to make the plies practically inseparable—gives a combination of prodigious strength. A Goodyear Rubber Belt is as nearly unbreakable as any Belt can be.

Rubber Belting

Long Life. The duck or fabric of Goodyear Belting cannot be reached by water, or anything else that would set up rot and destroy the Belt. A Goodyear Belt renders long and efficient service.

103

Factory Superintendents specify Goodyear Belting. They are satisfied that Goodyear Rubber Belting puts the plant on a power-saving basis. Write for free Book on the choice of a belt.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 33

Toronto, December 1, 1913

No. 23

Canada's Lumber Production in 1912

Statistics of the lumber production in Canada during the year 1912 which are published elsewhere in this issue contain a number of important facts which will repay careful study. In the first place, it is important to note that the total production of lumber in Canada, as published in a previous report, was 4,389,723,000 feet b.m., a decrease of 528,479,000 feet b.m., as compared with the output of the year 1911. Decreases were shown by every province in Canada, with the exception of Saskatchewan. The greater decreases in quantity took place in Ontario, where the production fell off by 331,663,000 feet b.m., or 19.3 per cent. British Columbia's decrease amounted to 28,160,000 feet b.m., or 21 per cent. The greatest percentage of decrease was in the case of Manitoba, namely 26.4 per cent., but as the cut of Manitoba is relatively small, this decrease only represented 14,210,000 feet b.m. The increase in the production of lumber in Saskatchewan was 22,510,000 feet b.m., or 16.7 per cent.

The relative importance of the different kinds of lumber manufactured, and the positions occupied by the different provinces as lumber manufacturing districts are of much interest as shown by the statistics. Although Ontario still leads with a production of 1,385,186,000 feet b.m., British Columbia has almost closed the gap between the two provinces, so far as the total production is concerned. British Columbia produced during 1912, 1,313,782,000 feet b.m., so that the difference between the two provinces is only 71,404,000 feet b.m. In 1911 Ontario had a lead of 375,000,000 feet b.m. With a continuance of similar conditions during 1913, British Columbia may be expected to show a considerable lead when the statistics for the present year are available.

Spruce continues to hold its place in regard to the quantity of lumber cut. During 1912, spruce was cut to the extent of 1,409,311,000 feet b.m., whereas the total cut of white pine, the next in order,

was only 911,427,000 feet b.m. The decrease in the cut of spruce amounted to 11.9 per cent. as compared with 1911. The decrease in white pine was 12.2 per cent. Douglas fir, third on the list, was cut to the extent of 889,861,000 feet b.m., and was the only one of the leading six woods to show an increase. This increase is responsible for the close race which the production of British Columbia is giving to that of Ontario.

The course of prices during the two years shows that there was an average increase for all classes of lumber of 41c per thousand feet. The most valuable of the leading woods was white pine, which showed an average of \$20.98 per thousand feet b.m., an increase of 97c. The average value of spruce was \$14.46 per thousand feet b.m., an increase of 81c. Although the total cut of spruce was more than fifty per cent. greater than that of white pine, the value of the white pine cut was nearly as great as that of the spruce, the former being worth \$19,119,694 and the latter \$20,374,853. The values of the Douglas fir averaged \$12.33 per thousand feet b.m., a decrease of \$1.61. The greatest increase in average prices was in the case of cedar, which advanced from an average price of \$14.86 to \$17.98, an increase of \$3.12. Other important increases were, hemlock 80c, balsam fir \$1.45, tamarack \$1.20, western yellow pine \$1.08 and elm \$1.18. The average value of basswood decreased by \$1.88. Birch decreased by 68c and maple 42c.

Spruce formed almost one-third of the total lumber production in Canada during 1912. White pine and Douglas fir each made up over one-fifth of the total. Hemlock formed less than one-tenth and its production amounted to only about 70 per cent. of its production in 1911. Spruce and white pine together formed over one-half the lumber produced in Canada in 1912. Douglas fir formed 20.3 per

RETAIL METHODS COMPETITION

An important announcement of a retail methods competition is published in this issue. Look for the announcement—on page 38. Owners of retail yards, and their employees should take part in the contest. The benefit will be widespread, and some one will win the prizes. Articles may be submitted until December 31st.

cent. of the total. Soft woods formed 92.9 per cent. of the total and hardwoods 7.1 per cent.

In the production of shingles British Columbia led with a total of 778,045,000 pieces. Quebec came second with 330,874,000 pieces, New Brunswick third with 280,081,000 pieces and Ontario fourth with 151,092,000 pieces. The average price of shingles during 1912 was \$2.01 and during 1911 \$1.91. In British Columbia the average price was \$1.93, in Quebec \$2.01, in New Brunswick \$2.06, and in Ontario \$2.38. The shingle production in Canada during 1912 decreased by 14.1 per cent. as compared with 1911. The decrease was evident in every province except Prince Edward Island and Alberta. Eleven different kinds of wood were manufactured into shingles during 1912. Red pine, ash, and butternut were added to the list and basswood and birch were dropped from it. Cedar formed 91.4 per cent. of the total as compared with 95.1 per cent. in 1911. Of the cedar shingles manufactured 53.9 per cent. were made in British Columbia, out of western red cedar.

The cut of lath during 1912 decreased 6.9 per cent. as compared with 1911, the total being 899,016,000 pieces. A reduction was evident in all the provinces except Saskatchewan, Prince Edward Island and Manitoba. Ontario, New Brunswick, British Columbia and Quebec, in the order named were the leading provinces and altogether produced 85.4 per cent. of the total.

The average value of lath remained practically the same during 1912 as during 1911, being \$2.30 per thousand, while in 1911 it was \$2.29. Ontario manufactured 63.7 per cent. of her lath from white pine and 13.6 per cent. from spruce. New Brunswick manufactured 53.2 per cent. of her lath from spruce and 37.3 per cent. from cedar.

British Columbia used Douglas fir for 64.7 per cent. of her lath and made the remainder out of cedar (15.9 per cent.), balsam fir (10.8 per cent.), spruce, white pine, tamarack, hemlock and yellow pine. Nova Scotia manufactured 61.2 per cent. of her lath from spruce and the remainder from cedar (16.7 per cent.), hemlock (13.9 per cent.), white

pine, balsam fir, birch and jack pine. Alberta made spruce lath only. Manitoba used spruce almost entirely, with a small percentage of birch. Spruce lath formed over one-third of the total in 1912 as in 1911. Spruce, white pine, cedar and Douglas fir formed altogether almost 90 per cent. of the total.

Canada's Foreign Trade in Lumber

The annual report of the Department of Customs which has just been issued, covering the fiscal year ending March 31st, 1913, shows that Canadian exports of lumber during the year were valued at \$33,439,382. Last year the exports under the same heading were valued at \$32,282,892. The exports of lumber to the United States were valued at \$21,572,580 as against \$18,283,380 in 1912. Exports of lumber to the United Kingdom were valued at \$8,676,608 as against \$9,657,775 in 1912.

Imports of lumber, timber, planks and boards, etc., free of duty during 1913 were valued at \$14,057,692 as against \$11,515,922 in 1912. Of these imports those which came from the United States were valued at \$14,972,855. In 1912 the imports under this head from the United States were valued at \$11,252,122, so that there was an increase in these imports to the extent of nearly \$3,750,000.

Exports of pine deals to the United Kingdom showed a falling off in value during the past fiscal year, the total values being \$1,285,863, against \$1,342,589 in 1912. Although the value declined, the total exports to the United Kingdom were greater than they were in 1912, being 17,507 standard hundreds, as compared with 16,728 standard hundreds in 1912. The exports of spruce deals to the United Kingdom showed a falling off both in quantity and value, the total being 114,797 standard hundreds, valued at \$4,683,821. In 1912 the totals were 137,456 standard hundreds, valued at \$5,309,113.

Planks and boards were exported to the United Kingdom during the past fiscal year to the extent of 81,618,000 feet, valued at \$1,825,549. In 1912 the totals were 96,795,000 feet, valued at \$1,965,224. There was thus a falling off in these exports, both in quantity and in value. The exports of planks and boards to the United States during the past fiscal year amounted to 926,620,000 feet, valued at \$16,248,542, whereas during the previous fiscal year the totals were 776,992,000 feet, valued at \$13,634,108. There was thus an increase in the exports to the United States of about 150 million feet and the value increased by over \$2,600,000.

Exports of pulpwood during the past fiscal year totalled 1,000,739

cords, valued at \$6,806,945. During the previous fiscal year the totals were 879,775 cords, valued at \$5,697,901. The exports of pulpwood were all to the United States. Exports of wood pulp mechanically ground, to the United States, totalled 3,313,950 cwt., valued at \$2,580,462. This was a falling off as compared with the previous fiscal year, when the totals were 3,728,141 cwt., valued at \$2,834,329. The exports of mechanically ground wood pulp to the United Kingdom on the other hand showed an increase, the totals being 1,434,649 cwt., valued at \$827,490, as compared with 1,295,427 cwt., valued at \$672,441 in the previous fiscal year. A small quantity of mechanically ground wood pulp was also exported to Japan.

The total exports of chemically prepared wood pulp during the past fiscal year were 1,112,457 cwt., valued at \$2,100,842, as compared with 835,239 cwt., valued at \$1,587,535 in the previous fiscal year. By far the largest portion of the exports of chemically prepared wood pulp went to the United States, the total during the past fiscal year being 1,155,380 cwt., valued at \$1,995,817. This shows an increase over the previous fiscal year, when the totals were 834,483 cwt., valued at \$1,585,615.

The free imports of lumber from the United States included 118,868,000 feet of pitch pine, valued at \$2,435,376. This was an increase as compared with the previous fiscal year, when the total was 91,441,000 feet, valued at \$1,929,923. The imports of planks, boards and other lumber, dressed on one side only, amounted to 382,774,000 feet, valued at \$6,087,560. This was an increase over 1912 when the totals were 378,202,000 feet, valued at \$4,984,737. Among the other interesting imports shown in the customs report are the following: Fence posts and railway ties, 1913, \$1,856,711, 1912, \$1,115,132; logs and round unmanufactured timber, 1913, \$1,001,717, 1912, \$821,173; mahogany, 1913, \$475,148, 1912, \$314,409; oak, 1913, 80,787,684 feet, valued at \$3,227,113, 1912, 63,457,644 feet, valued at \$2,449,542; white ash, 1913, \$204,847, 1912, \$152,990; staves, 1913, \$305,329, 1912, \$215,482; shingles, 1913, \$277,551, 1912, \$123,102.

Canadian Lumber Competing in U. S. Markets

Probably there will never be a time when it will be impossible to find two well substantiated arguments opposed to one another, in connection with a matter involving customs tariffs. We have often had occasion to discuss the opinions of lumbermen in the United States regarding the tariffs between that country and Canada, and one of the chief bones of contention has been the ease with which southern yellow pine has been hoisted over the Canadian tariff wall and sold on Canadian markets at prices which take away a lot of the trade in Canadian pine, hemlock and spruce. Now, the boot is on the other foot, for the removal of the duty on lumber entering the United States has opened the eyes of United States producers to the fact that they must now face competition of a more severe nature than that which existed formerly.

The St. Louis Lumberman pleads the cause of the United States manufacturer forcibly in a recent editorial, which will be read with interest by Canadian lumber manufacturers who have been brought up in the school of just such competition as the Americans now fear that they are facing. The article referred to is in part as follows: "Trade with our neighbors to the north has been very sensibly influenced by the removal of the duties on lumber, live stock and most of the agricultural products, under our new low tariff. Some such result had been expected and was, in fact, invited by the makers of the Underwood-Simmons bill—especially as to local cross-boundary

trade; but it is doubtful if the tariff reformers as a whole had anticipated so sudden and considerable an influx of Canadian products into our markets.

"Nor yet are we quite persuaded that, in the case of the lumber and allied industries, the reported serious disturbance to the Northwestern shingle manufacturers is altogether the work of the new tariff. We imagine that a considerable part of it may be due to our antiquated shipping laws, which compel the American producer, under heavy tax penalty, to use for water transportation purposes only American vessels where the shipment is destined to any point in his own country. His Canadian competitor on the other hand, has unpenalized access to the ships of every land in the world, and as a result is able to obtain much lower rates of transportation than the American shipper. It has been often stated that the difference in this regard compensated, say, the British Columbia lumber manufacturer for the former duty he had to pay in delivering his products to San Francisco or other points down the West coast.

"Undoubtedly, too, Canadian manufacturing lumbermen in British Columbia, Ontario or any of the other provinces have always enjoyed a distinct financial advantage over their fellow lumbermen in the United States, in that they have been able to obtain timber cheaply from crown (government) forest-bearing lands, paying for it practically as they took it off and disposed of it in the form of lumber.

American lumber producers, on the other hand—thanks to the absence of a national land policy which would have protected our Northern and Southern forests from private ownership—have to maintain a large investment in standing timber, covering twenty to forty years' supply of saw material, thus adding heavy interest charges to the cost of their output. That is a handicap which becomes very pronounced when sales are made in territory comparatively near to Canadian sources of production. In that case the Canadian mill man has a second distinct advantage, in lower freight rates for his cut. The illustration of the fact is graphic when a comparison is made between the freight rates from Southern producing territory and those from the Georgian Bay district mills to the large markets on this side of the upper and lower lakes.

"In the agricultural instance, the advantage of the Canadian producer consists in the vast area of fertile and comparatively cheap lands west and northwest of Winnipeg.

"So the country, after all, has small excuse for being surprised at the reports that shingle mills in the State of Washington are closed down and, in numbers of instances, are moving to British Columbia—especially in view of the fact that the red cedar shingle trade has been very much depressed for several months past. Nor yet should it in anywise marvel that heavily increased exportations of Canadian agricultural products to this side of the boundary line are reported by our consulates at Winnipeg, Toronto and other points in the Canuck

country. Business for American account was bound to increase greatly under the stimulus of free entry to our markets; and it has responded to the inevitable by so increasing—with the perfectly natural accompaniment of rising prices. Noting both of these tendencies, our vice-consul at Toronto says that the prices of cattle jumped in one month from \$6.50 and \$6.90 to \$7.50 and \$7.75 per hundredweight for choice butcher stock, with choice heavy-weight steers as high as \$8.25 per hundredweight, and stockers rising from \$5.50 to \$6.50.

"And this is only the beginning of trade developments which will greatly affect our markets from the outside."

And yet, in the face of this competition of Canadian lumber in the markets of the Northern States, we find southern pine complained of by Canadian lumber manufacturers, on the ground that it is spoiling the markets in Canada for Canadian pine, hemlock and spruce. An interesting letter dealing with this feature of the case is published elsewhere in this issue, giving the views of a prominent southern pine manufacturer, regarding the low prices at which yellow pine is sold in Canada. This letter makes the frank and interesting admission that such stocks of yellow pine as are so frequently sold in Canada at prices in the neighborhood of \$21 for rough No. 1 common, are below the cost of production, and are rendered possible only by the sale of larger blocks—from which they are the surplus—at prices high enough, to cover loss on the balance.

Insects Causing Serious Loss to B. C. Timber

An important report upon damage caused to standing timber by insects in British Columbia has been made by Mr. J. M. Swaine, Assistant Entomologist for Forest Insects in the Ottawa Division of Entomology. The report states that the timber of the lower coast and Vancouver Island is not at present suffering from extensive insect outbreaks; but there are incipient attacks which need to be kept under careful observation. Cedar and yellow cypress are quite generally hollow-hearted and stag-headed. These affections are probably always of fungous origin. No serious insect injury to these trees was found in this summer's work. In many places the western white pine is being killed by the western white pine bark-beetle. It was found killing green timber, particularly at Cowichan Lake and the district about Campbell River. Wherever valuable stands of white pine are held, a watch should be kept for attacks by this destructive beetle. Clumps of "red-tops" and scattered "red" and "yellow-tops," with the bark bearing numerous tubes of gum surmounting vertical tunnels between the bark and the wood, are danger signals and should receive prompt attention if the timber is to be saved.

The Douglas fir, which forms the bulk of the timber of this region, is generally in fine condition. Several incipient outbreaks of the Douglas fir bark-beetle should be kept under observation; but no considerable body of dying timber was found. At Cowichan Lake and Campbell River, isolated red-top firs had been killed by this species, and it is everywhere abundant in slash and dying trees. The spruce budworm which was very abundant in many places a few years ago is now hardly to be noticed.

Ambrosia beetles are excessively abundant in dying wood. Their small black tunnels pierce the sap wood, but rarely penetrate more than five inches. The most injurious of the British Columbia Ambrosia beetles is very abundant throughout the lower coast and Island districts in freshly cut logs of Douglas fir, hemlock, spruce and balsam, and drives its tunnels seven inches and over into the wood.

The lower part of the Interior from the railway belt south to the boundary, harbours a large number of destructive forest insects. The bull pine, western white pine, lodgepole pine, engelmann's spruce, western larch and Douglas fir are seriously affected by destructive pests.

The Western Pine Bark-beetle is particularly destructive. The Western White Pine Bark-beetle is almost as serious an enemy to the bull pine as to the white pine from which it derives its name. Serious

injury by these species is evident in many places but the most destructive outbreak appears to be that about Princeton. The clumps of "red-tops" containing from five to thirty-five trees have already become very numerous, although the dying trees have only been noticed two years. These "red-tops" are, of course, dead trees, the majority of which were killed last season. In the surrounding green trees many trunks were studded with the pitch-tubes of the borers which have left the red-tops to attack the green timber. From 1500 to 2000 pairs of beetles were working in the lower fifty feet of each of the attacked trees examined. These trees will add greatly to the size of the red-top patches by next Spring. Thousands of trees have already been killed and the fine timber in the valleys of the Similkameen and Tulameen is threatened with widespread destruction. Similar outbreaks, as yet of less importance, are starting in several parts of the bull pine country.

After discussing other outbreaks, the report considers methods of control and states that the most important control measures include felling and barking the recently infested trees, and in certain cases burning the bark. The methods to be followed in each case depend upon the habits of the beetles concerned; and should be conducted according to the advice of a forest entomologist. The investigations leading to this important report is being carried on jointly by the Dominion and Provincial departments.

A report from Washington, D.C., states that F. B. Cole, the well-known shingle manufacturer, known as "The Shingle Baron of the Pacific Coast" has complained that Canadian shingles under the new tariff are taking precedence over United States shingles. Canadian shingle manufacturers, he says are rejoicing over the new tariff act. "Months before the new law was passed," he is reported as saying "representatives of Canadian shingle factories were going through the large places in Washington and other States, making contracts for the delivery of shingles in the United States at a much less price than we could produce them for. You see there is an export duty on Canadian wood suitable for making shingles. But under the new Tariff law shingles come in free. The Canadians are the only ones that are profiting out of these features of the new law. Vancouver has greatly increased her output of shingles. But it has not only hurt the manufacturer of shingles. It has resulted in the substitution of patent roofing in many places, with the result that there will not be any use for American-made shingles pretty soon."

Operations at a Logging Camp in B.C.

Laying out the Site—Surveying and Mapping—The Importance of Powerful Equipment for Handling Logs—The Camp Personnel.

By C. W. Scarff.

The subject of forestry is an interesting one to many people, especially to those of us who are handling its products. The Pacific Northwest being a heavily wooded section, it naturally follows that logging and lumbering is one of the chief industries, and in this age of sharp competition no one can hope to succeed in a large way unless he is equipped with the latest and best mechanical devices. Horse-power is being rapidly supplanted by steam, although under certain conditions the faithful horse is still in evidence.

The writer, who is not yet willing to be called an old man, can well remember the time when the bulk of timbers used in ordinary construction were hewed by hand from logs hauled to the building-site on wagons or sleds, but that was back East where logs were small and could be man-handled, and where practically all mechanical labor was done by hand. The great forests of the West had not yet been discovered or needed, but now we are depending very largely on the vast forests of the Pacific Coast to furnish America with building timber. Even Europe is looking this way for her future supply, now that direct waterway is about to be opened, thereby making it possible to deliver lumber and other Western products very cheaply to European ports. I may be a little over-sensitive about destroying the life of a magnificent tree in the forest (loggers are supposed to have no feelings about the matter other than of greedy satisfaction in the thought of gain), but I never see a live, vigorous tree fall without a shudder. Something as when a companion or friend has been suddenly called away never to return. In fact, this business of logging strikes me as being analogous to human surgery with this difference: in human surgery we operate on people who are sick, but in tree surgery we operate on trees that are sound. We have little use for conky or decaying timber. Before going to British Columbia to engage in logging I had operated a logging and lumber business in Washington for several years, but as the size and quality of the timber in British Columbia is fully equal to Washington or Oregon timber and the methods of logging are practically the same, a general description of our camps on Powell Lake, British Columbia, will illustrate the operations as now practised on the coast.

Surveying the Camp Location

Before starting operations for a logging camp the owner, or his foreman or engineer, makes a careful survey of the topography of the ground to be logged over, using similar principles as to grade and slope as a road supervisor would in laying out a highway, for much depends on the "pitch of the camp," as we say in the woods, this can only be taught by experience and consists of intelligently following the lines of least resistance. The topographical map shown on page 30. illustrates the lay of 1,000 acres. In handling trees of large dimensions, some of them yielding logs that scale 3,000 to 8,000 feet of timber, great care must be exercised in falling to avoid breakage. Then, as to yarding it is equally important that the hook tender so adjust the cable as to properly glide the log between stumps and other obstructions, out and down to the main skid road, where it is hooked on to the Roder cable and hustled on its last journey down to the railroad or the water. And as the poet says about logs,

"Though just a little journey from their home upon the hills,

Topographical map illustrating the lay of 1000 acres

They ne'er return, they're swallowed in the maelstrom of the mills."

At the present time we are logging on Powell Lake, a large body of fresh water 75 miles north of Vancouver. Here we have our camps built on rafts for convenience in moving, as our timber is all near the water, extending ten or twelve miles along the shores of the lake. This is not only convenient but economical as well, for when we finish logging at one stand our tug boat hooks all the camp buildings together in line and tows them to the new location. This is usually done at night and the crew wake up next morning anchored at the new camp site, ready to begin opening up new territory. In logging big timber we depend on steam or electric power almost entirely to handle the logs. Here is a case where necessity became the mother of invention, for were it not for the introduction of powerful donkey engines and heavy steel wire cables, we would be powerless to handle the logs.

Laying Out the Cable Lines

By reference to the diagram of "Goat Island Camp," on page 30. the reader can see how our lines are thrown out. Our "Roder" donkey is placed near the shore of the lake and the main 1½-inch cable is represented by the heavy black line extending to "D." We commenced logging on this site last July, and threw out our main line as far as point "A," a distance of 800 feet—this map is not drawn to scale but merely shows the plan of the skid roads. After logging everything clean as far back as "A," we threw out the line on side extending to "H," by using a yarder donkey to pull in the logs, likewise another line later on to "G," still later we extended the skid road to "D," and hauled out our yarding donkey which we located at "C," where it now stands. The dotted line "B," indicates the return or haul-back line, a ½-inch wire cable used to pull back the main cable to "D" after delivering a load of logs into the water. This pull-back line is also used to steady the tension on the main line when coming down a steep decline. There is a steep rocky ledge just above the

Camp at Goat Island—Showing layout of logging lines

Diagram to illustrate the difficulties of a hook-tender's job

Goat Island Camp on Powell Lake, B. C.

camp on the left with quite a valley behind it carrying a heavy stand of timber. This was all brought out by snubbing the cable at "G" and a switch-back back to "A." Our roader donkey, 100 h.p. nominal rating, is now operating 2,400 feet of cable line which extends about two-thirds of the way to the back line of the timber at this place. The yarder donkey is therefore able to bring in all the timber within a radius of 1,200 feet. We will take off about 16,000,000 feet of timber from this setting of the camp. When this is completed we will tow the buildings and machinery further down the shore and set up at a new camp.

The main line skid road from the lake to a point D, is what we call a "fore and after" track, and consists of three lines of logs lying parallel, the middle one being sunk in a furrow and the two logs on the side forming a cradle or trough through which the logs slide when they start on their last journey. By first pulling in a few logs over the ground the dirt is removed after the manner of a snow plough, and the ground is moulded into a good furrow or form to receive the casing of logs which are laid with the ends lapping forward joined on a bevel so as to offer little or no resistance to the passing logs. Occasionally the cable choker, through slack wire, slips on a steep grade, and then—look out for a toboggan slide! A short time ago a fir log 40 feet long by 3 feet diameter, said good-bye at the top of the incline and shot down grade to the water's edge. There was a cedar log at the lower end of the skid road that had not slipped into the water, and the coming impact split the end of the cedar into five or six strips extending half the length of the log and penetrated the fir log a distance of seven or eight feet. The two logs are still floating around inside of the boom, telescoped in a death grip.

Camp Comment

The hook-tender commands about the highest price for his services of any man in the camp, and much of the profit or loss is traceable to him. Frequently logs fall in such a way that it is very difficult to remove them and get them started toward the skidway. This

is necessarily so, owing to the very rough, ledgy, stumpy ground on which the logs fall, even when the fellers use their best judgment and utmost care in falling. When logs are wedged in a pocket a bungling hook-tender can break the cable and strain the donkey engine in

How the Skid Road Spans a gulch.

a remarkably short space of time, whereas a skilful hook tender would have the log out again, "on again, gone again,"—as Flanagan would say. One of the pen drawings shows a log fallen between stumps B, C, D and E; the skid-road parallels the log on a down grade to camp

Roader Donkey used at Goat Island camp.

On its last journey—Log being skidded to lake.

at F. The log must be got out of the pocket by means of a jury line through a pulley and terminating in a clamp attached to the main cable. The hook catches the line near the butt end of the log, as shown in the sketch. It may be necessary to give the log a twist, or a roll over in drawing it backward in order to clear obstructions. If the hook tender wishes to roll the log to the right he attaches the hook as shown in the cut. If to the left he would slip the cable around until the hook came down under the log, or up under the far side of the log so that in pulling back the log would naturally roll to the left.

When the ground is quite rough and the skid-road crosses deep ravines or gulches, we construct elevated skids, something like a bridge, as shown in one of the illustrations. Logging is hard work all the way from stump to cargo, but the western logger is a hardy, healthy chap and he seems to like his job even in the winter, when he is up against much rainy weather. A little wet weather, however, does not bother the logger, and when night comes he hangs his duds up on the line around the bunkhouse stove to dry, and retires to his couch to sleep the sleep of the just.

Important Members of the Camp Crew

In the organization of a logging camp the "fallers" are important factors. They are the Lord High Executioners, as The Mikado would say if describing a lumber camp. They wield the axe and the bite of the axe is fatal. Mammoth trees that have withstood the ravages of the elements for centuries are powerless in the presence of the axeman. When the faller has the tree about severed from the stump he stands aside and shouts "Timber! Timber!" as a warning to anyone who may be within radial distance of the falling tree. When the tree is felled the faller's assistants, whom we call "buckers," make short shift of cutting it into proper lengths, trimming off any limbs or protruding knots ready for delivery to the hook tender. In every logging camp a few men are detailed for right of way work and we call them "swampers." It is their work to slash underbrush, corduroy swamps and build skidroads.

When the logs are in the water there is still a lot of work to be done before they are ready to be towed to market. Here is a place where business is always "booming," that is, lining up the logs and binding them in sections is called "booming." Logs when thus harnessed up can be safely towed to market over inland waters. Some camps in British Columbia tow their logs 150 miles or more in the Straits down to Vancouver mills, but it is not practiced to tow logs out on the open ocean where storms and ground-swells are liable to occur, although specially built booms made by lashing chains around the logs, are sometimes towed to San Francisco, but even when such precaution is taken booms at times are lost.

Long Life of Fallen Timber

It is a well-known fact here on the coast that fire-killed or wind-fallen timber keeps wonderfully well preserved for many years. This is a great surprise to the eastern lumberman when he first visits this coast, to see loggers bringing in perfectly sound fir logs that have laid prone on the ground in the forest for 15 or 20 years, and cedars that have been down for hundreds of years. The writer has seen sound cedar logs, 5 to 8 feet in diameter, sound as a silver bell, lying flat on the ground overgrown, or straddled, by living trees of equal size evidently five to six hundred years old. This is no joke, but actual fact, though it may appear to be incredible. At Goat Island camp we are logging fir and cedar that was fire-killed 16 years ago by the Indians, who set fire to the forest in that vicinity to make deer hunting and trailing less strenuous. The fir logs are still sound with the exception of the sap about one or two inches deep, which is entirely decayed. Cedar shows little if any decay, on the surface. I might add that of late years the government has organized a forest protection service and the Indians are restrained from committing further depredations on the forests.

The logger is the real missionary in opening up the way for settlement in this country. The forest must be swept away before the homesteader can get a chance to reclaim the wilderness and make it fruitful through tillage, and I might add that it requires a pretty stiff broom and a strong arm to do the sweeping. Many people who have never seen the practical operations of a logging camp wonder how it is possible to operate heavy steam machinery in the timber, much of which is on steep hillsides with intervening canyons, but the experienced logger can coax his donkey engine up and down very steep grades by attaching the cable to a large stump and the revolving drum winds up the cable by moving the engine and not the stump. It is a case where either the stump must come to the donkey or the donkey go to the stump, and the donkey is not as stubborn or as well anchored as the stump, hence the donkey makes the concession. In fact, the donkey engine is a very docile animal when handled by a careful hostler, but in operating the donkey engine, with its cables extending far into the woods, over hills, around obstructions, trailing a load of logs over the ground, it is very essential that the hook tender be in constant and instant communication with the engineer. This is

secured by means of a wire trailing parallel with the skidroad, one end of the wire attached to the steam whistle of the donkey engine, the other in the hands of the "signal boy" whose sole duty consists in watching the hook tender, ready to pull the signal at a moment's notice. In this way the donkey engine can be started or stopped instantly. Carelessness on the part of the signal boy results in breaking of the cable, or even more serious damage. Wireless communication has not yet been applied successfully to logging operations.

Logging big timber, such as we have here on the coast, necessarily creates much waste, or what an Eastern man would call waste. Timber is large and unwieldy, much of it is found on rough, ledgy hillsides and even when great care is exercised in falling, many trees break and split, rendering it unprofitable to haul them out of the woods. Then again quite a large proportion of the timber, such as hemlock, cottonwood, alder and maple find but little market as yet. We are too far from the centres of consumption to make it possible to transport the lower grades of timber to market. Conditions, however, are improving and we are now clearing the forests much more thoroughly than did the logger of 20 years ago. Transportation is the greatest problem of civilization and as facilities for carrying lumber improve, so will our business be extended and become more profitable. Canadian lumbermen and loggers have hitherto been handicapped by reason of tariff discrimination in the United States market, and also of the great distance to European markets, but now that the "Tariff door" is open for lumber and shingles entering the United States, and the locks of the Panama Canal are about to be unlocked, thereby creating an open door to a much wider European market, we shall hope for a speedy revival of the lumber business and that British Columbia will come into her own.

Storm Felled Much Standing Timber

Reports from Thessalon, Ont., state that woodsmen and hunters going out of the timber country adjacent to the Mississauga Forest Reserve tell of great damage caused to the standing timber by the recent great storm. Opinions vary as to the extent of the damage, but everyone reports that it has been tremendous. One man estimates that no less than 40 per cent. of the timber has fallen. The loss involved will not only include the timber which has fallen, but there will be great danger from fire next season and for several summers to come, unless steps can be taken for removing the down timber. Lumbermen, operating upon limits bordering on the reserve will be obliged to devote a great deal of extra labor to the clearing of roads which have been badly obstructed. One of the lumbermen returning from the limits estimates the damage at about 70 per cent. of the total timber standing before the storm. Similar reports have been received from Muskoka and Parry Sound districts, although the extent of the damage in these cases is not reported as being so great. It is probable that the timber in the government reserve, which has fallen, will be disposed of by tender as soon as definite reports can be received regarding the actual amount of the damage.

Price Brothers & Co. Present Good Annual Report

Price Bros. & Company, Quebec, P.Q., closed their financial year at the end of November and reported the largest year's trade of any in their history. The output of paper products was greatly in excess of the 1912 output. During the first ten months of the year the company sold far more lumber than during the corresponding period of 1912. Ties, shingles and lumber showed a combined gain of more than \$190,000 over the sales of the previous year. The figures were as follows:—

Ten Months' Sales		
	1912.	1913.
Ties	\$ 6,419	\$ 42,939
Shingles	63,713	138,214
Lumber	695,463	777,194
	<hr/> \$765,595	<hr/> \$958,047

Michigan Logging Conditions

A meeting of the lumber manufacturers and jobbers of Marquette and Alger Counties, was recently held at Marquette, Mich., for the purpose of discussing business conditions in connection with woods operations. Representatives were present from a number of the most important operating companies in the two counties and a thorough discussion took place upon the general state of the market and also upon the wage question. Everyone reported that the demand for lumber was exceptionally slow. The general opinion was that this would have to result in some reduction in the amount of logs taken out during the coming winter. Wages in the woods this winter will be lower than they have been of late. They will average between \$26 and \$32 a month, most of the men receiving about \$30. As high as \$40 a month has been paid of late years, but such prices for labor during the coming winter would be ruinous to the operators, according to the general opinion of those who attended the meeting.

Canada's Lumber Production During 1912

Details of Output in Each Province—Ontario Shows Gréatest Quantity, Closely Followed by British Columbia—The Course of Prices

The production of lumber, timber, lath and shingles in Canada during the year 1912 is the subject of a bulletin, No. 40, which has recently been issued by the Forestry Branch of the Department of the Interior. An advance notice of this bulletin appeared in the Canada Lumberman of August 1st. More detailed statements however, are included in the complete bulletin, some of which we reproduce.

In Ontario, a total of 811 mills reported a production of 1,385,186,000 feet of lumber, an average of 1,708,000 feet per mill. Over half this total was white pine, of which the province cut over seven hundred million feet. The cut of this material decreased by over one hundred million feet, or by 13.6 per cent., from 1911 to 1912. The three pines (white, red and jack pine) together formed almost two-thirds of the lumber cut in the province. Hemlock, with over one-tenth of the total, was second on the list. The cut of this material decreased by 39.1 per cent. from 1911 to 1912. Spruce showed a still greater proportional decrease, amounting to 42.1 per cent. of the 1911 total. This cut was made up largely of white spruce, with a small percentage of black spruce.

Ontario's two most important hardwoods showed an increase in production. Maple increased by 31.7 per cent., and basswood by 24.7 per cent. Elm showed a slight decrease of 4.2 per cent. and birch an increase of 8.3 per cent. The hardwoods formed 13.2 per cent. of the production, with a total of 182,738,000 feet—this being a greater production of this material than in any other province.

* Less than one tenth of one per cent.

The average price of lumber in Ontario increased from \$17.81 in 1911 to \$19.33 in 1912, an increase of \$1.52. This increase is due to a proportionate increase in the value of lumber of white pine, hemlock red pine, spruce, elm, birch, jack pine, cedar and others. The more important decreases to be noted are in the prices of maple and basswood. The most expensive woods reported were hickory at \$31.97 and walnut at \$31.85, and the cheapest, poplar at \$12.61. White pine was the most valuable softwood at \$21.26 and hemlock the cheapest at \$13.89.

Twenty-six different kinds of wood were cut in Ontario in 1912. The total number for the whole of Canada was twenty-eight and, of these, two kinds only, Douglas fir and western yellow pine, were not cut in Ontario. The woods peculiar to the province were tulip, walnut, black gum, ironwood and sycamore.

British Columbia's Lumber Production

A total of 176 mills reported the production of 1,313,782,000 feet in the province of British Columbia in 1912, an average of about 7,465,

000 feet per mill. This figure indicates the large average size of the mills in this province.

Over two-thirds of the total was made up of Douglas fir, of which this province cut over 800 million feet in 1912. The production of Douglas fir, which is practically confined to this province, increased by 5.2 per cent., or by over 40,000,000 feet in 1912. The cut of lumber in the province as a whole decreased by 2.1 per cent., in spite of the increase in the production of Douglas fir. Other notable increases are in the case of spruce (12 per cent.), white pine and balsam fir. The decreases were in the case of cedar (25.2 per cent.), tamarack (11.1 per cent.), yellow pine (32.9 per cent.), hemlock (21.6 per cent.), jack pine, poplar and birch.

Maple.....	2		3	*	60		20 00
Birch.....	1	27	1	*	12	12 00	12 00

The average price of lumber in British Columbia in 1912 was \$13.50, a reduction from 1911 of 83 cents. Douglas fir, spruce, hemlock and white pine decreased in value. Cedar, tamarack, yellow pine, balsam fir, jack pine and poplar all showed increases from 1911 to 1912.

The percentage of hardwoods in this province was practically negligible (less than one-tenth of one per cent.) being formed of poplar, maple and birch.

The most expensive wood reported in quantity was cedar at \$18.61 and the cheapest Douglas fir at \$12.33.

Quebec Province Output

The province of Quebec reported in 1912 the production of 677,215,000 feet of lumber from 842 mills, valued at \$10,693,262. This is an average per mill of some 804,000 feet, board measure.

This total is a reduction of 10.5 per cent. or almost 80,000,000 feet. Decreases in production took place in all the more important woods, with the exception of white pine. The cut of spruce decreased by 12.3 per cent., of birch by 1.7 per cent., of hemlock by 26.2 per cent., balsam fir, 39.1 per cent. and basswood, 4.5 per cent. Other decreases were in the production of cedar, ash, elm, poplar, tamarack, jack pine, butternut, cherry and hickory.

The cut of white pine in 1912 exceeded that of 1911 by over eight million feet, or by 10.4 per cent. Other increases to be noted are in the case of red pine, maple, beech, oak and chestnut. Walnut was not reported from this province in 1912.

The hardwoods together formed a total of 92,733,000 feet or 13.7 per cent. of the total for the province, a greater proportion of hardwoods than in any other province.

The average price of lumber in Quebec was \$1.61 higher than in 1911. The price increased in the case of spruce, white pine, hemlock, balsam, fir, basswood, cedar, red pine, ash, elm, beech, tamarack, butternut, chestnut and hickory. Decreases in average value are evident with birch, maple, poplar, oak, jack pine and cherry. The most expensive wood cut in quantity was white pine at \$22.85, and the cheapest, hemlock, at \$13.01.

There were no woods cut exclusively in this province. A total of twenty kinds of wood were reported in 1912 for Quebec as compared to twenty-six for Ontario. The six kinds cut in Ontario, but not in Quebec, in 1912, were tulip, walnut, black gum, willow, ironwood and sycamore.

The spruce cut in Quebec contains a large proportion of red

spruce, especially in the Eastern Townships; some black spruce is also included.

New Brunswick's Production

The lumber production of New Brunswick in 1912 decreased by 3.8 per cent., from 467,500,000 feet in 1911 to 449,738,000 feet in 1912. This lumber was produced by 199 mills cutting an average of 2,260,000 feet per mill.

The decrease in production in New Brunswick was due chiefly to the decrease in the cut of spruce, which amounted to six per cent. of the total for 1911. Other decreases took place in the production of white pine (29.9 per cent.) and red pine. All other woods were cut in increased quantities, but not sufficient to make up for the decrease in the three kinds mentioned.

The cut of hardwoods in the province made up 11,809,000 feet or 2.6 per cent. of the total.

The average value of lumber cut in the province of New Brunswick in 1912 was \$13.44, a reduction of only 5 cents from 1911. The mill value per thousand of the following woods was reduced from 1911 to 1912; spruce, white pine, jack pine, ash, butternut and elm. Increases took place with balsam fir, hemlock, birch, cedar, maple, beech, red pine, poplar, tamarack and basswood. Of the more important woods of the province the most expensive was cedar at \$17.59 and the least expensive, hemlock at \$11.72.

Sixteen different kinds of wood were sawn in 1912. Oak, hickory,

chestnut and cherry, sawn in Quebec in 1912, were not sawn in New Brunswick.

The spruce cut in New Brunswick is made up of white spruce, with a large proportion of red spruce, and a smaller proportion of black spruce.

Nova Scotia's Lumber Output

Nova Scotia's 361 mills cut a total of 312,763,000 feet of lumber in 1912, an average of 866,000 feet per mill. The total cut shows a decrease of over 75,000,000 feet, or 19.4 per cent., from 1911.

Spruce alone formed almost two-thirds of this total, and spruce, hemlock and white pine made up over nine-tenths of the total. The decrease in the cut of spruce amounted to over fifty million feet, board measure, or 21.4 per cent., of the 1911 cut. The production of hemlock was reduced by 15.3 per cent. and white pine by 14.6 per cent. The other decreases were with balsam fir, red pine and elm. The only increase of note was with birch and amounted to 2.2 per cent. Other increases taking place were with maple, beech, oak, jack pine, poplar, ash and tamarack.

* Less than one tenth of one per cent.

The hardwoods together made up 19,324,000 feet, only 6.2 per cent., of the total lumber production of the province.

The average price of \$13.77 per thousand is an increase of 80 cents over 1911. The prices increased with spruce, hemlock, red pine, oak, poplar, ash and elm. Decreases occurred in the average prices of white pine, birch, balsam fir, maple, beech, jack pine and tamarack.

White pine at \$15.94 was the most expensive of the more important woods, and balsam fir and maple the least expensive at \$10.95 and \$10.43 respectively.

Willow was added to the list of 1911 and cedar and basswood removed, as no wood of these two kinds was reported from the province in 1912.

A total of fifteen different kinds of wood was sawn in the province in 1912. With Ontario, Nova Scotia cut all the willow lumber produced in Canada.

Table 6.

Poplar.....		437				14 00	

The spruce in Nova Scotia is practically all red spruce. White and black spruce are of secondary importance.

Production of the Prairie Provinces

Saskatchewan alone reported an increase in its production of lumber in 1912. A total of 157,255,000 feet of lumber was sawn, forming an increase of 16.7 per cent. over 1911. A total number of 23 mills produced this lumber at the rate of 66,837,000 feet per mill, almost as great an average per mill as in British Columbia.

The lumber was 99.2 per cent. spruce at an average value of \$16.12. This price was a decrease of 69 cents from the price in 1911. Small quantities of tamarack and jack pine were also sawn in this province, but are relatively of no importance.

No hardwoods were cut in 1912; even poplar ceased to occupy a place on the list.

This province cut fewer kinds of wood than any other, with only three species on the list. The spruce was practically all white spruce

with a small proportion of black spruce. The tamarack and jack pine were the same species as those cut in eastern Canada.

Mills in Alberta reported a total of 47,478,000 feet of lumber for 1912. Altogether, 46 mills contributed to this production, with an average of 1,032,000 feet per mill. The total is a decrease of 7.1 per cent. from 1911.

Over ninety per cent. of the total quantity in this province was spruce, as in the other prairie provinces. The cut of spruce decreased

Table 8.

* Less than one tenth of one per cent.

700,000 feet. The cut of all the other kinds of lumber produced in the province also decreased, with the exception of Douglas fir.

The only hardwoods cut are poplar and birch and these together form a negligible quantity (one per cent.).

The average price of lumber in Alberta increased by only three cents. The average price of spruce increased by 13 cents, but that of all the other kinds produced showed decreases.

Some of the spruce of this province is probably Engelmann spruce similar to that cut in eastern British Columbia. The jack pine is partly eastern jack pine and partly lodgepole pine, similar to the jack pine of British Columbia. A small quantity of Douglas fir is cut on the east slope of the Rockies.

The production of lumber by Manitoba's 48 active mills, cutting an average of 824,000 feet, was so much reduced in 1912 that this province fell below Alberta in the list of provinces. The reduction from 53,745,000 feet in 1911 to 39,525,000 feet in 1912, a decrease of 26.4 per cent., was greater than was the case in any of the other provinces.

Spruce here formed almost 93 per cent. of the total and suffered a reduction of 20.6 per cent. from the preceding year. All the important kinds of wood showed reductions in cut from 1911 to 1912.

The few hardwoods cut in Manitoba (3.4 per cent.) are found in the river-bottoms in the eastern portion of the province and are of relatively little commercial importance.

The average price of lumber in Manitoba dropped also, being reduced by 53 cents. Among the important woods, spruce and tamarack dropped in value and poplar and jack pine increased.

Altogether nine kinds of wood were manufactured into lumber in 1912.

White spruce made up the greater part of the spruce lumber cut in Manitoba and the prairie provinces. Only small quantities of black spruce are sawn, although this material will be used more as the supply of white spruce decreases. Of the poplars, aspen is cut in greater quantities than balsam poplar, or balm, although the latter wood has a smaller percentage of defect. The other species cut are similar to those in the eastern provinces except the oak, which is all scrub oak.

Canada's smallest province, Prince Edward Island, cutting only 0.2 per cent. of the total quantity of lumber produced, used fourteen different kinds of wood to make up that cut. The 52 mills, cutting an average of 130,000 feet per mill, produced 6,771,000 feet of lumber in 1912. This is a decrease of 12.2 per cent. from the production of 1911.

Spruce and balsam fir together formed over three-quarters of the total. The cut of spruce decreased by 7.5 per cent. and that of balsam fir increased by 27.5 per cent.

The hardwoods in this province form 13.5 per cent. of the total—a large percentage but a relatively small quantity.

The average price of lumber increased by 52 cents per thousand feet, increasing in the case of spruce, balsam fir, birch and hemlock.

United States Wood Imports and Exports

The August summary of the Bureau of Foreign and Domestic Commerce of the United States Department of Commerce shows a decrease of \$776,197 in imports of wood and manufactures of wood. The import figures for August of this year were \$5,477,915, as compared with \$6,254,112 last year. The total import values for the eight months of 1913 ended with August were \$37,712,400, as compared with \$34,917,700 for the corresponding period of last year.

On the export side August showed an increase over August of last year, that in exported wood and wood products amounting to \$577,867. The total value of exports in August was \$9,999,151, while for August last year the figures were \$10,577,018. There is a remarkable increase shown in the exports for the eight months' period ended with August of this year over the corresponding period of last year, the increase being \$10,518,790.

The Reader's Viewpoint on Trade Topics

Opinions on Questions of General Interest—Yellow Pine Prices in Canada—Forest Survey Costs

Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few that have been received lately:—

Why Cheap Yellow Pine Floods Canadian Markets

Editor Canada Lumberman: Kansas City, U.S.A., Nov. 13th.

I have read with interest yours of the 10th inst., and believe the Canada lumbermen may be misled by the class of circular letters sent out by some of the yellow pine manufacturers.

There is nearly always a surplus, and odds-and-ends accumulation of different items of stock at the yellow pine mills, which is often dumped onto the market at considerably less than the regular market price, usually consisting of something accumulated in manufacturing some particular stock on orders which have been figured at a price sufficient to cover losses which might result by reason of the undesirable accumulation. This class of lumber is accumulated more at the small mills which do not attempt to carry any lumber in stock, often loading it out as fast as it is accumulated, placing it in transit, or shipping it to some wholesaler at the best price they can get. The lists which you enclosed are typical.

This method of doing business is very hurtful to the lumber trade; but, as you doubtless know, there are a great many small mills operating in different sections of the yellow pine timber belt, the business management, I am sorry to say, in many cases being very poor. The low prices are however, not always confined to the small mills. Surplus stocks accumulate at the majority of mills, and much lumber is sold far below the cost to manufacture, at given periods. Many an operator considers only the average price he gets for his entire production, and I am sure low prices are often the result of poor merchandising.

I am thoroughly satisfied, as I have before stated, that yellow pine lumber is sold as low in the United States as it is in Canada. I feel assured there is no distinction made by the manufacturers of this product as to where the lumber is sold, price being regulated entirely by supply and demand. I think it is safe to say that there are numerous manufacturers of yellow pine who sell their lumber during depressed periods, such as we are having now, at less than it cost to produce. They reason that to discontinue their operations would mean the disorganization of their mill forces, and besides, a certain amount of fixed expense by way of deterioration and other fixed charges would continue whether the mill was in operation or not, and so it is quite a difficult question with some operators, at given periods, to determine the wisest course to pursue.—R. A. Long.

The Cost of Forest Surveys—A Reply to Mr. Sewall

Editor Canada Lumberman: Montreal, P.Q., Nov. 19th.

Referring to a letter headed "The Cost of Forest Surveys," signed by Mr. James W. Sewall, and published in the current issue of the Canada Lumberman, the writer wishes to point out that he anticipated and answered that letter by the following article which appeared in the Pulp & Paper Magazine of February, 1912.

"THE FORESTRY ENGINEER: As forestry engineering is just budding in Canada there are of course many lumbermen and timber limit operators of the 'old school' who are to some extent justified in their contempt of the scientific forester. To many heads of corporations and directors there is a vague feeling that the forestry engineer, if called to assist, with his drastic measures and recommendations, and his alarmist reports (beautiful with technical polish) on the waste and destruction, burnt areas, etc., will so injure the credit or fair name of the company that it is better to look for other means of taking stock of the limits.

"Perhaps not the least of the instinctive objections to the engineer and forester is the idea that his charges are exorbitant. In some cases no doubt the cost of forest surveys is excessive and altogether out of proportion to the benefit derived therefrom. But this should not be erroneously charged to the principle of scientific forestry, but rather to the individual forester's lack of experience and his ignorance of conditions and methods necessarily peculiar to this country.

"There may be a tendency among forest engineers who have had no experience in this country to encumber their methods by adhering

to practices of European countries, though often the methods used, even so close as in some of the northern states, would be misapplied in Quebec and Ontario, thus awkwardly increasing the cost of the survey and incidentally hurting the prestige of the scientific forester. For instance the running of lines should not be practiced too freely on large limits in remote parts; neither should contour lines be considered important as valuable data to the operating company. These two are very costly and altogether out of proportion to their usefulness. Rivers, creeks and lake shores, from which compass cruise lines are run, should take the place of expensive base lines over mountains and across river courses and other obstacles. Should a new and perfected map of the limits be required, a stadia survey of the lakes and water courses, showing mountains, is all that is necessary. The forest engineer's method should not differ very materially from that of the old time cruiser. If he has the required experience in this country it will not be necessary for him to use his calipers on every acre. But his method of following and examining a river valley should be so pursued that he may see every part of the drainage area, examining it in compass strips from the shores at frequent intervals, thus classifying each and every small part. As for contours, the engineer's notes of his observations should as a rule, be sufficient to locate obstacles and the various degrees of incline. This incline towards a river is always more or less noticeable within its drainage area—a natural advantage facilitating the locating of logging roads. Taking every water course in this manner, a limit is quickly and economically examined. Expertness on the part of the forester in catching all essentials is, however, the best guarantee of efficiency on all points. If he cannot, at a glance, determine the feasibility of driving rivers, locating storage reservoirs or of placing shanties and jobbers, as well as be able to make an accurate map of all water courses and timber, showing the quantity and quality of the various kinds of wood; and most important, if he cannot do all this by quick and economical methods, he had better not undertake the work, for he will surely discourage the employer by the excessive cost of the work under his charge."

Naturally one must presuppose a certain degree of expertness on the part of forestry men else it is incumbent upon them to follow the laborous method of calipers (and possibly folding step ladders) as suggested in Mr. Sewall's letter.—R. O. Sweezey.

New Brunswick's New Crown Lands Regulations

Editor Canada Lumberman: St. John, N.B., Nov. 18th.

Allow me to preface a short letter by saying that I am not a politician. If I were, and were hunting for points to criticize, doubtless I could find something in the way of criticism against the newly adopted system of management of Crown lands in New Brunswick. On the other hand, if strongly in favor of the present administration, I would have only words of commendation. As a matter of real fact, however, the present system is too new to have yet demonstrated its practical workings. In all fairness I think we should all be willing to assist in its enforcement until its merits or demerits are apparent. As yet there are no practical results other than the fact that the Government is realizing quite a moderate sum of money from its renewal leases. It is an old saying that "you can not have your cake and eat it," therefore, remembering the history of Maine and how their wild land resources were gathered into the State treasury, and, although perhaps not squandered at the same time, expended for various purposes, I am wondering whether or not there is any advantage in having a good fat year or two while leases are being renewed, and then a very much decreased revenue for a long period. Certainly, larger revenues in the end can be obtained by simply depending on yearly revenues, but this is partly offset of course by interest. Individual interests and government interests are not always identical.

The policy recently adopted in this Province may be the best on earth and it seems to me that it is the duty of every well disposed individual, as it is actually in force, to simply await without criticizing or finding fault for a considerable time, or until its weak points, should any ever develop, can be used as an argument in favor of a different policy that would be of benefit to the whole people, rather than any political party. While I am still of the opinion that I could have framed a better policy, I am not egotistical enough to presume to know it all, or that I am justified in saying that this policy is no good I may be ready to acknowledge later, that the scheme is better than any I could have devised myself. Summarizing, it seems to me the duty of all citizens to withhold all judgment until the present system has had a good trial.

New Brunswick.

Use for Waste from Hickory Billets

Editor Canada Lumberman: Drayton, Ont., Nov. 17th.

We produce a waste piece of rock elm from each billet we use in manufacturing hockey sticks. The piece is 1½ in. x 3 in. x 36 in. long and we would like to know what this should be made into. The timber is choice, well-seasoned and should work up to advantage in turned goods, handles, etc., but not being familiar with any of these lines, we would appreciate some suggestions.—Canadian Flax Mills, Limited.

Bulletin No. 36, issued by the Forestry Branch, Ottawa, dealing with the wood using industries of Ontario states that manufacturers of brush backs, small axe handles, light whiffle-trees, hames, wooden taps and spiggets, wire screen frames, tent pegs and rope slides, use rock elm of the size mentioned in the above enquiry. It might be possible for the enquirer to get into touch with manufacturers who would purchase their waste wood for use in their own factories, but it would be more economical in every case for the firm producing this material to manufacture it into a finished product, if at all possible. The bulletin referred to above contains a list of articles for which each kind of wood is best suited and by communicating with some of the firms manufacturing articles from rock elm, the enquirer will probably be able to get in touch with some who will purchase his waste material, if he does not decide to utilize it himself.

A Fairly Brisk Fall Trade

Editor Canada Lumberman: Woodstock, Ont., Nov. 21st.

Throughout the territory we cover in Western Ontario, the fall trade has been reasonably brisk, but of late dealers are not buying any more than will serve their immediate needs, partly, we presume, because of the tightness of the money market, and partly because retail lumbermen like to clean up their stock as much as possible before stock taking.

The trade reports good prospects for Spring business, and we expect that shortly after the first of the year, the buying will again become brisk.—R. E. Butler Lumber Company.

The Woodmen's Lien Law of New Brunswick

By M. L. Haywood, B. C. L.

An important matter of a legal nature in connection with logging operations is the working out of the Woodmen's Lien Act in the various provinces. In a general way, most timber operators understand that their employees may secure a lien upon the logs, to the extent of any unpaid wages due them. The details of the act however, are not generally understood. The following explanation of the Act in force in New Brunswick, which does not differ materially from the similar enactments in other provinces, will give operators a good idea of their situation.

Persons who may claim a lien:—"Any person performing any labor or services ——— shall have a lien thereon for the amount due for such labor, service or services," section 3.

"The words 'labor, service or services,' shall mean and include cutting, skidding, felling, hauling, scaling, barking, driving, rafting or booming any logs or timber, and any work done by cooks, blacksmiths, artisans or others, used or employed in connection therewith," section 2.

The words of the last section are very broad, and would no doubt be held to cover work done by teams and by scalers, counters, "cookees," carpenters, "road monkeys," etc.

The Act, however, is intended to apply only to persons who work for wages, and the New Brunswick Supreme Court has held that a contractor who cuts logs at a certain price per thousand is not entitled to a lien, although part of the work is actually performed by himself. *Baxter vs. Kennedy*, 35 N.B. Reports, 179.

The employers of the contractor are, of course, entitled to a lien; but if he engages his wife as cook the contract is not a valid one under the New Brunswick "Married Woman's Property Act," and she is not entitled to a lien. *Bow-master vs. Patterson*, 37 N.B. Reports, 4.

A creditor who advances cash or supplies to carry on an operation is not entitled to a lien.

Priority of lien:—"The woodmen's Lien 'shall be deemed a first lien or charge, and shall have precedence over all other claims or liens,' except Crown dues or charges, or the lien of the owner of land for stumpage, or of a streams improvement or boom company for tolls.

It has been held that woodmen employed by a contractor who is getting lumber for an incorporated company, are entitled to a lien even although their claim is filed after a winding-up order has been made against the company, where the labor was performed before the order was made. *Good vs. Nepisiguit Lumber Company*, 41 N. B. Reports, 57.

Property subject to a lien:—"The lien given by section 3 applies to 'any logs or timber intended to be driven down rivers or streams or hauled directly from the woods or brought by railway to the place of

destination," and section 2 provides that "the words 'logs or timber' shall mean and include what is ordinarily known as logs or timber, and shall not include cedar posts, telegraph poles, cordwood, railroad ties, tan bark, or shingle bolts or staves."

Under this section it has been held that sawed or manufactured lumber is not covered by the Act, so if the logs are cut up in a mill the lien is lost. *Baxter vs. Kennedy*.

Statement of claim:—"The first step in placing a lien is to file a statement in writing, under oath, in the office of the Clerk of the County Court in which the labor or services, or some part thereof, were performed, section 4.

Form of statement:—"The statement must set out briefly the nature of the debt, the amount due, and a description of the logs or timber to be attached, according to the form given in the Act, section 5.

It is sufficient if the statement, etc., substantially complies with the Act and describes the services, etc., with reasonable certainty.

When statement must be filed:—"The statement in respect of work done in the woods, is to be filed within thirty days after the last day on which such labor or services were performed, and in respect of work done in stream driving, within twenty days, provided however that the lien is not effected by a sale of the logs within such period, section 6.

The work however, must be actual bona-fide labor, and not merely work done to secure a lien, and in a case where woodmen stopped work on January 25th, returned on March 14th, without any request to do so; worked two days and then filed a lien, it was held that the lien did not attach; as the returning to work on March 14th, was not a bona-fide continuation of the work but merely a trick or device to secure the benefit of the Act. *Guimond vs. Belanger*, 33 New Brunswick Reports, 589.

The claim itself must be an honest one, and, if the evidence shows that the work was not done in good faith or that the claimants are acting in collusion with the contractor in order to defraud the owner, the lien will not be allowed. *Murchie vs. Fraser*, 36 New Brunswick Reports, 161.

Release the logs:—"The owner of the logs may have them released from the lien by filing with the Clerk a bond, as required by section 13, or he may pay the money into a bank under section 14. The logs are then released, and if afterwards upheld, the lien is in force against the bond or cash.

Subsequent proceedings:—"If the amount due is not paid after the filing of the statement, the claimant applies to the Judge of the County Court of the County in which the logs may be and on production of the affidavit required by section 9, the Judge orders a writ of attachment to be issued to the Sheriff. The attachment is served upon the defendant, section 11, and the Judge names a day for the hearing of the claim, section 15; and if he finds the claim valid, orders the sale of the logs and the distribution of the proceeds, section 19.

Swedish Pulp Mills in Trouble

C. E. Sontum, Canadian Commercial Agent at Christiania, Norway, in a report to the Trade & Commerce Department at Ottawa, says that the pulp situation in Norway and Sweden is most unsatisfactory and that one of the largest pulp concerns in Norway is seriously considering closing down one of its two mills. The majority of the large timber firms in the north of Sweden, owning large forests, have already started pulp mills and it is not probable that in the future there will be any such rapid extensions in the production of mechanical wood pulp as has taken place in recent years.

A recent despatch from Kingston, Ont., stated that arrangements were being made to carry out an experiment in the paroling of young criminals, which would involve sending them to work in the lumber camps throughout Canada. The Canada Reading Camp Association is reported to have agreed with the Dominion Government to take charge of about fifty young prisoners now serving terms in the different penitentiaries. It is stated that the men will be given work in the woods as axe-men.

The report of the Crown Land Department of New Brunswick for the year ending October 31st will show larger receipts than during any previous fiscal year. Nearly \$252,000 has already been received in cash bonuses in connection with new Crown timber land licenses. Between \$1,600 and \$1,700 has been received for Crown land sinking fund. The territorial revenue receipts will be over \$50,000.

John R. Booth, Ottawa's veteran lumberman, has donated a new wing to St. Luke's Hospital, Ottawa, at a cost of \$125,000. Mr. Booth has been president of the Board of Directors of the institution for many years. It is reported that Mr. Booth is now very largely recovered from the serious injury which he recently suffered when he was struck by a falling timber at one of his mills which had been destroyed by fire.

The Retail Dealer and His Problems

Have You Solved a Difficult Problem—Let Others Know How

Competition for Retailers

Retail Lumbermen have plenty of yard and office troubles. Everyone has his own way of handling difficulties. Send us a letter about one of your own problems and the way you handle it. We are offering prizes for the best letters.

Fifteen dollars for the best.

Ten dollars for the next best.

Five dollars for the third best.

If you do not come among the first three, you may be among the next five, to each of whom we will give a year's subscription to the Canada Lumberman. If already a subscriber, you will be given credit for another year.

It won't be any trouble to write and you may get one of the prizes.

Others will benefit from your idea, you will get the benefit from all the ideas of all the others.

Any yard or office problem will do. Make your own choice and write soon. The contest will close on December 31st and the prize winners will be announced as soon as possible after that date.

If drawings are necessary to illustrate your idea, they may be included, or a rough sketch may be sent, from which we will prepare an illustration. Make the sketch plain and our artist will carry out your ideas.

Three experienced retail yard men will be the judges.

The contributions will be numbered in the order received and the names withheld until the judges have given their decision.

Care of Oak Flooring

A great deal has been written about the care and handling of oak flooring after it leaves the retail yards, but very little has been said to educate the retail dealer in the proper storing and handling, says W. L. C., in the American Lumberman. In a great many yards oak flooring is handled very much like dressed rough lumber, stored in sheds that are open at both ends, thereby exposing the oak flooring to such an extent that it absorbs moisture from a thirty-second of an inch to one-sixteenth. When the floor layers receive flooring in this condition, it readily can be seen what an imperfect floor it will make. The floor layer and the dealer are always prone to blame the poor condition of the floor to the manufacturer. They seem to overlook the fact that all hardwood flooring will absorb moisture, and oak flooring is no exception.

In one city a short time ago, 2,500 feet of oak flooring was laid in a beautiful home and after the job was completed there appeared a number of unsightly cracks, mostly toward the ends. The dealer and the contractor blamed this condition upon the manufacturer of the oak flooring. The oak flooring manufacturer and a chief inspector travelled 500 miles to investigate this case. After spending a little time at the dealer's yard, they found the oak flooring stored within a few feet of a large opening in the warehouse and, upon measuring many of the pieces, proved that they were swelled about one-sixteenth of an inch from the original manufacture. The period was during the winter season and practically the only protection that this oak flooring had was an ordinary roof and the rear boarded. The contractor, instead of keeping this oak flooring for at least ten days in a dry place in the house where it was to be used, immediately laid it with the aforesaid results. After explaining to the architect, who was a broad-minded man, he agreed with the manufacturer that the direct trouble was in the abuse of the oak flooring by the improper housing given it by the retailer.

I cite the above case to point out the fact that the retail dealers should have better accommodations for the storing of oak flooring. The most modern retail yards have a certain portion of their warehouses divided off, double boarded and steam heated. Steam heat is very essential in the middle and northern climates during the winter season to keep oak flooring in normal condition. The expense of this additional care is trivial compared with the benefits derived. Floor layers and contractors will invariably trade with a yard that keeps the oak flooring in a good condition during the winter season. The mod-

ern retailer should be in a position to give advice to contractors and floor layers when it is necessary.

In another city some time ago an 8-inch brick wall was bulged out to the extent of 2 inches and, after investigation, the cause was laid to oak flooring, which was abused by too much water being used in scrubbing the floor. Usually, in a case of this kind, the floor will bulge upward about in the middle, but in this particular case it was found that nails were used very generously on to an oak sub-floor.

Not long ago the writer was called upon to look at a beautiful oak floor that was very badly abused by the contractor, who laid the sub-floor with apparently green stock which shrank to such a degree that it opened up unsightly cracks in the flooring. This was revealed by measuring the sub-floor from the under side in the cellar. The sub-floor should be reasonably dry and laid diagonally. Boards of about 6 inches wide are preferred and should not be put down too close; at least an eighth of an inch space should be between the boards. All thicknesses of oak flooring should have a sub-floor. Many jobs are badly damaged by improper sub-floors, especially where $\frac{3}{8}$ -inch oak flooring is used.

Atmospheric conditions peculiarly affect oak flooring throughout the season and with this in mind it surely would pay the retail dealer to give it more care, so that when the contractor calls for it for laying it will be in the proper condition for use.

The Value of Good Size Stocks

The modern dealer in catering to the consuming oak flooring trade will find it more profitable and advantageous to buy in straight carlots. The cost is much less, besides assuring the arrival of the flooring in better condition. It is just as important to carry a good stock of the various grades, faces and thicknesses in oak flooring as it is in yellow pine or sash and doors. The dealer who keeps a good supply of the various kinds of hardwood flooring on hand will find it to his interest to get more trade and is in a much better position to serve his customers than the old-fashioned dealer who buys two or three thousand feet at a time.

Many dealers neglect hardwood flooring by not carrying a sufficient quantity for their prospective customers and by not pushing it by way of newspaper advertising in their respective towns, or talking it to architects and contractors.

A Merit System for Yard Employees

You may save a little by stopping a few leaks but you will save more by stopping all of them. Too many of us get hoary-headed on account of the carelessness of our help. You have heard the sympathetic expression of letting the other fellow worry. Well, I am not going to tell you what can be done and what you can do. I am going to tell you just what I told the Lumbermen's Association some years ago—that if you will install and carry out my system of merit, and that if it does not save you enough money every year to pay the expenses of a trip for you and your entire family to the annual convention and in addition pay your subscriptions to all the lumber journals, I will buy you a suit of clothes if each one who does make that much will buy me a hat.

I am in a position to know, for this system enabled us to make a good bunch of money each year through a hard lumber scrap and at the end of it to come under the wire with a smile.

This system is simply to give each employee \$1 extra each week, with the understanding that they will be fined 5 cents for each error or case of carelessness. And I want to add that we have reduced our profit and loss items at least 95 per cent. I never fine any employee more than \$1, so there is nothing to be lost but something to be gained.

I first apportioned the duties among the salesmen, bookkeepers, yard men and drivers so they knew what was expected of them. Then I drilled them for two weeks without fines, simply calling their attention to the things that they would be fined for, and then put the scheme in force. Here are a few things laid down for the yardmen:

He must have the firm's interest at heart and not remain in our employ over night if dissatisfied.

He shall be responsible for the correctness of all outgoing orders.

He shall see that all goods brought back are not taken from the wagon until a credit ticket is made.

He shall see that all wants are put on the want book before the particular stock is depleted.

He shall report all errors, fines, and disobedience of other employees, including himself.

He shall not extend credit, especially to those of whose standing he is uncertain, without consent of the manager.

He must report for work at 6.30 each morning.

He must see that yard tools are in the tool box at all times except when in use.

He must see that all former wagons are tagged and that circulars enclosed in envelopes are put in each wagon.

He must see that the yard is properly closed and that roof does not leak.

He must see that a ticket is made out for every purchase and that the initials of the one who made the ticket are on it and also that the initials of the one who loads it and the one who hauls it are properly appended.

He shall see that covers are on all sash and transoms so that they will not get broken.

He shall see that there are not as many as six nails on the floor of the hardware room at any time.

He shall see that the driveway is kept clean and that all piles are even and neat; and so with many other things that are too numerous to mention.

Now some of you may say that your yardman does these things anyway, but I say that he doesn't and will bet you the price of a trip to your yard to prove it. But be that as it may; if you have all these things arranged so that no one can lay all the blame on the other fellow you will never lose a customer or have one become dissatisfied by not getting credit for stuff returned or by failing to get his stuff when he asks. Besides you will save hundreds of dollars on stuff that otherwise would be broken or not charged.

I could keep on enumerating these things for as long a period as a dear mother-in-law makes her visits, but I claim in this merit system that you have all the other advantages combined. It is a regular combination goer and a winner. It is the ounce of prevention and will save you more money than any other scheme ever devised.—"Dr." Louis L. Ott, in the American Lumberman.

Advantage in Being Prepared to Estimate

I presume there are a number of young dealers who have often wished they could make out a list of items for a building and be sure that it was correct and sufficient to complete it. There are many times that a regular customer will come in and want to put up a small building and do most of the work himself, or he may want to make some repairs or an addition to enlarge a building that is too small for the purpose. He is pretty handy with tools, but he doesn't know much about figuring the quantity of material that the job will require. He doesn't care to consult a carpenter for the carpenter would want to do the work, and so he wonders if the lumberman can't help him out, and he goes and tells him what he is going to build. This class of customers is not large, but it can be made larger by the dealer by letting it become generally known that he is competent to make out a bill of what is needed for the ordinary building common to that locality. It also creates an understanding in the community that the dealer who can do this has a thorough knowledge of his business, and the natural tendency therefore is to impel people to gravitate towards him when they want to know anything about building matters. To be considered an authority in this line is a most effectual advertisement for his business. I used to carry a standing local in our town paper like this:

"If you want to know about anything in the building line, see 'Kit' about it."

I never changed this nor took it out of the paper, and the latter part of it became in time a sort of a by-word. So, in a way, I commercialized my nickname. Of course, this being an authority brought me a good deal of extra work at times during the busy season, but the pleasure of having confidence of this nature placed in me was a compensation, to say nothing of the amount of non-competitive business it brought me. It is true, however, I did not sell all the bills I made out, but what I did by this means amply paid me for the extra bother and work that it entailed.

Knowledge of this kind gives a dealer a standing in the community that is different from that of being merely an agent of a lumber company. I have known carpenters who were excellent workmen in the mechanical part of their trade, but they could not visualize a plan and make out all the necessary items for it that would give them confidence enough to make a contract to build it. Hence they remained skilled workmen and drew daily wages from a contractor who, perhaps, could not do the work they could.

Of course, you understand that I mean by this that a dealer may be a good lumberman and be able to run a yard successfully without knowing much about the details of building construction. But if he has this knowledge it will add greatly to his efficiency and give him an advantage over a competitor who can only figure on bills that some-

body else has made out. And, besides, it makes him less dependent on the carpenter, and this of itself is a good reason why he should know those things.

The business of a retail lumber dealer is so diversified that he should be able to figure out quantities of material for other jobs than where lumber is used. He should know the amount of brick or stone required to lay a foundation or build a chimney; the amount of the different materials also for the plastering of a job; likewise the amount of paint and the bill of hardware necessary for any building.

There is so much cement used nowadays that a lumberman is obliged to know more about it than he formerly did, in order that he may protect himself from unskilled workmen, as very often the material is blamed for a poor job, when the real reason for it is the ignorance of the workmen. Farmers are using cement for many purposes where they formerly used lumber, and no doubt most of them want to do their own work, as they do with lumber. But unless they use cement according to the exact formula, the result is a poor job, even with the best quality of material. Then they will blame the dealer for selling them cement that has lost its strength and is no good. This is why a lumberman who handles cement should know all about it, and the proper way to use it, so as to be able to instruct his customers who are going to do their own work, in mixing and applying it in the job. You can go over the cement sidewalks in your own town and see the results of the unskillful use of the best of cement, but the workmen who did the job no doubt told the owner that the cement was too old and had lost its strength, and so the reason for the poor job was blamed on the dealer who sold it. And unless he knew differently, he might think he had got "stuck" on a poor shipment, and therefore he in turn passed it on to the manufacturer.

Some years ago, when the building block game was all the rage and many lumber dealers thought they saw a fortune in it, and invested in a machine for making them, I anticipated just what had come to pass. The great majority of those who went into it found by experience that the making of artificial stone was a more complicated business than they were aware of before they went into it—that it needed knowledge and skill, and a constant exercise of it in the choosing of suitable materials and mixing them in their proper and exact proportions. It was thought that common labor could do this. So it could, but it must be directed by expert intelligence to make it effect the best results. So the dream of "every man his own builder" and concrete blocks doing away with the use of lumber has gone into the limbo of other freak possibilities. But this is not saying that concrete blocks cannot be made right. They can, but not by Tom, Dick and Harry, for as I've said before, they require the best materials mixed with expert skill and intelligence.

Requires Knowledge and Intelligence

I have talked with a number of contractors of concrete construction, and they all tell me that only by the proper and careful mixing of the right proportion of the materials can a good job be obtained. There is no such thing as a "fair to middling" job of concrete. It is either good or it is bad. I have stood and watched the process of mixing on a number of the large concrete jobs in this locality, and I noted there was a man standing by the mixer all the time to keep tab on the proportions of material and the proper time allowed for the mixing before the load was dumped. An engineer on one of the jobs said that a single load that was not as it should be in point of proportions or mixing might prove a serious damage to the whole building and expensive experience has taught contractors that "eternal vigilance" is absolutely necessary to effect a good job of concrete work.

When I was running a country yard, about all I sold cement for was to plaster the sides of cisterns. They could dig a hole in the ground in that country without much danger of caving in, so this peculiarity of the soil was utilized for the making of a cheap cistern. A good many farmers used to buy the cement for that purpose and try to do their own work of putting it on, and many is the complaint I have had made to me that the cement wasn't "worth a cuss," because it either fell off or it would not hold the water. Then I would give them some out of a fresh barrel to patch it up, or put on another coat, but with all that it was never a good job. But where it was done right in the first place by a competent workman those cisterns lasted a long while. I remember selling fifteen barrels of German Portland cement at \$5 a barrel to a farmer who said he was going to make sure of having enough soft water for the house to last through the dry season. I gave him the formula for mixing it with the sand and told him I would not guarantee the cement unless he had the right kind of sand, and it was mixed as I told him. Luckily, he got hold of an old brick mason who knew how to do it, and working by the day he had no object in skimping the job. This was in 1880. A few years ago I met the son of that farmer and in answer to my inquiry about the big cistern he said that it was in use yet, and had had but little repair in all those twenty odd years of use. I had to learn how to figure accurately the material required for one of these cisterns. There were, of course, different sizes to suit different requirements. They were circular in form, and egg shaped at the bottom, and where the man could afford

it, the top was bricked over, although many at first just covered them with a wooden frame.

Didn't Have to Guess

When a man would come in and want to know what it would cost him for a 50, 60, 70 or 80-barrel cistern, it puzzled me greatly at first, and I had to get out my old arithmetic, and find out the rules governing such measurements, but I learned them over again; dug it out without any teacher. I have had contractors come to me for just such class of information, and it was a pleasure to know that I could give it. You and I know that a good deal of such work is done in the country by guessing at the quantity of materials required or the number of days' work to do the job. To my notion, the lumber dealer should be able to do all such figuring and do it fairly accurately.

Just about this time of the year we used to have farmers come in and tell us that from the appearance of things, they were going to have a good crop of small grain, and would be wanting to build more granary room. Doubtless there are some dealers reading this who will have the same thing said to them this year, and will for a few years to come, but it is only those who are on the edge of the prairie that will hear much talk about granaries. Farmers in the older sections have built what they wanted of this class of buildings long ago. But where they have got to be put up, it makes a good trade for the lumbermen during a couple of months at least. Sometimes it may look as though not many will be required. Then the crop conditions may change for the better in a week, and the farmers will swoop down on the lumber yards and want the material right away if the markets are not to their liking. There is a certain proportion, however, who are obliged to thresh out of the shock or stack, and haul most of it to the elevator to get money for pressing liabilities but the better conditioned farmers always want storage room to hold their grain for a better market.

Now, the average farmer, or carpenter either, does not know the size of a building that will hold a certain amount of grain, nor do they know how to build it with the strength that it should have, and this is the reason why the average granary breaks down, or otherwise needs repairing after a year or two of using it to its full capacity. It is money wasted to put up a light framed building for this purpose, but many do it on the score of forced economy, and eventually lose more by it in a year or two from the loss occasioned thereby. In a way, this may not seem to interest the lumber dealer directly, but poorly constructed frame grain houses are partially responsible for the competition of the circular galvanized iron grain bins that are now on the market, which appeal to the farmer as being better than the ordinary grain house he is acquainted with. It is up to the lumberman therefore to show that if a frame granary is properly built, it is far superior for the farmer's use than anything else. An iron bin can be used for nothing else, but a good frame granary may be used for storing other things when it is empty or partly empty of grain. Then again, it affords room for the cleaning of grain for seed or running it through the fanning mill to dry it.

Due to Ignorance and Carelessness

I have often thought that this tendency to run after substitutes for lumber is largely due to the ignorance and carelessness in the manner which lumber has been put together in buildings. It has not been used right in construction. Anybody who could drive a nail or saw off a board, thought he could put together the various parts of a building, and this has been done without any regard to strength of materials or their being adapted for the purposes intended. This has been especially true with regard to farm buildings. If shingles, for instance, had been properly used and treated as the rest of the outside of a building, we would not hear as much as we do about their being condemned as a fire liability.

This prevailing cheap class of building construction has reacted on the lumber industry, and because of this, it becomes the business interest of every retail lumberman to educate his public up to the using of better and more substantial methods of putting lumber into buildings. It has been a common aim to build as cheaply as possible, and if you will examine the building plans as sent out by the mail order concerns, you will find that this idea has been catered too in a skillful manner. The principle scheme is to furnish just enough to put the form of a building together with the least number of pieces and as little strength as possible and the result is a "shoddy" building whether it is a house or a barn, but it is deceiving as to its real character.

I have drawn your attention to this subject of poor construction because it is a feature in building that is not generally thought of in connection with the advocacy of using lumber in preference to substitutes, but I know what I am talking about, when I assert that cheap construction is largely responsible for much of the prejudice engendered against the use of it in buildings. A properly constructed granary costs more in proportion to its size than any other building on the farm, because of its needed strength to hold and sustain the heavy weight of grain. Besides, it must have the very best of roof or great damage will ensue. One holding 2,000 bushels of wheat will have to bear a weight of 120,000 pounds or 60 tons. There are times perhaps,

when one end of it will be full and the other empty, causing thereby an unequal strain on the foundation, and the frame. Do you suppose the average farmer thinks of this when he is planning how cheap he can put one up? Just mention the weight it will have to carry, and he looks at the matter in a different way, and perhaps may ask what you think about it. The next thing is, do you know what strength should be put in the foundation and floor to bear it, or the number and size of studs and the manner of their fastening to prevent bulging or breaking loose? If you don't, you ought to, if you are asked to make out a bill for one, by some customer who supposes that because you are a lumberman you know all about such things.

Things the Dealer Should Know

Now if I tell you what I used to do in such matters, I don't want you to think that I have a case of exaggerated ego and infer that I know more than anybody else. I'm simply telling you these things of what I did that they may be helpful suggestions to the young fellow who is wanting to make himself better equipped to deal with every thing pertaining to the country trade. When you go to a big city to run a yard you won't have any farmers to deal with, but you will have other things as well that are relatively as important. There never was a year in my country experience, that I did not have some farmer come and ask me something like this:

"I want to build a granary large enough to hold a 1,000 bushels of wheat and 2,000 bushels of oats (or more or less as the case might be), and what will it cost me?"

It might be a corn crib or storage room in a barn for a certain amount of hay. But no matter what it was of things of this nature, I had qualified myself to give definite and positive information. In the case of the question about the granary, I would be frank to ask the first thing, about what amount of money he wanted to put into it. Then I would tell him the amount of weight it would have to sustain when full, and tell him also of other things, that would make a substantial building for the purpose. If the bill as figured out, came to more money than he could afford, I told him I could figure less material for a cheaper construction, but he would have to take his own risk, as I would only guarantee it as I had made it out in the first place. Farmers are usually sensible in such cases, and in most instances they would decide to invest a little more than they had intended, and take up with my first estimate.

I found that it took a good deal of valuable time during the busy season to figure out these bills for customers who knew I could do it, but I know it was an accommodation to men who didn't know where to look for a carpenter when they wanted one. And as I had taken pains to encourage this sort of thing, I did my best to meet the requirements of a "free horse." More over, I considered it a part of my business, and one that paid me well for my expert knowledge and extra work.

Had Some Handy Plans

After a year or two of such experience, I conceived the idea of making up a lot of plans with their bills of material for every kind of building that was common in country and town in those days, so that when anyone wanted to know the approximate cost of any one of them, all I had to do was to consult my files and tell them. Then if any change was required to meet certain desires as to style or cost, I could do it in very short time. This, I found was a great saving of time when I was busy, and the parties were in a hurry also. Another thing about it was, I often sold a bill right then and there, before the party left the yard, when perhaps, if I had told him to come in in a day or two and I would let him know, he might have taken that interval to reconsider his notion of building just then. When a man has the fever of the building spirit, you want to nail him before he cools down.

Another plan I had that served me when I was away from the office, was a few rules I worked out for telling the approximate cost of a common dwelling house, barn, granary, or corn crib. I ascertained this by figuring out the cubic feet in buildings of this kind I had sold, and after finding out what their total cost was for material and everything else, I would readily tell the cost of a cubic foot, and make my rules accordingly for a certain class of structure. I carried a list of these rules around in a little book, so I was always loaded for this class of information.

Now, my young friends, what I have done along this line of preparedness, you can also do, if you will only set your mind to it. You will find that the mere fact of your having such knowledge is of itself a compensation—you will get out of your business just what of yourself that you put into it.—C. H. Ketredge, in the Mississippi Valley Lumberman.

Heavy U. S. Exports to Australia

During the next three months, 20,000,000 feet of lumber will be exported from Portland, Oregon and Columbia River ports, to Australia, New Zealand and the west coast of South America on eight vessels now under charter to one firm.

A Talk With the Lumbermen of B. C.

No. 2—By Douglas Fir

The writer remembers having heard a discussion when a boy, between two men of different political beliefs. One was a Justice of the Peace, the other a conservative. When the discussion had reached the limit of endurance for the J. P., and the conservative was still unmoved in his opinions, the J. P. asked him if he could tell him the meaning of the word "conservative." This rather staggered his conservative friend, who after a moment's hesitation replied: "No Sir, Your Honor, I cannot." This man was placed at a disadvantage through no fault of his own, perhaps, but through ignorance for which he may not have been in any way responsible. He knew he was a conservative, but did not exactly know what it meant, nor why he was one. Perhaps it was hereditary.

What is a "Lumberman?"

Today when we look round about us how clearly can we see this man reflected in our business? How many are lumbermen today, either directly or indirectly, who do not know why? There are those, and their number is by no means small, who are ready to curse the day when they first became interested. Amongst them are found those who are lumbermen by heredity, but with no further claim to distinction. Again there are those who are natural born lumbermen, amongst whom are to be found the men who know what the word "lumberman" implies, but whose number, we regret to say, has unfortunately become greatly diminished, owing perhaps, to the intrusion of those in the business whose interests enable them to become dictators of policy, without having learned any thing of the business.

It seems to me that one of the greatest mistakes we make is when we look upon the lumber industry, or speak of it, as a business. I believe that it should be considered more as a profession than merely a business. We can busy ourselves with anything, but we cannot all become professionals at those same things. I have heard it stated as a detrimental feature of the white workingmen of British Columbia, that many of them were no good unless they got jobs that suited them. Personally I do not look upon this as a detrimental feature, but believe that the more suited men are to their work, whatever they may have in hand, from the lowest to the highest position of the industry, the better results will be attained. How often have we, who have had the management of men, found that by taking a man from a position at which he was of little use, and placing him in another he would fill it to perfection? This, I say, is a study,—a profession. Can a man, let him be ever so brilliant, without study, take hold of the medical profession, music, hardware, or dry goods business, or the publishing of a trade journal and achieve any degree of success? If not, then why find fault with a man in our business because he does not fit well in a job he does not understand? Some may say that it is silly to compare the lumber business with the medical profession; but let me tell you that those who do are not aware of the many little ills with which our industry is affected, and which can so easily prove fatal if not well watched by the experienced eye of practicability.

The True Lumberman a Conservationist

The duty of every true born lumberman of the present day is to study the problem of conservation. Let his political views be what they may, as a lumberman, he should be a conservative, and should be able to give a reason for it; for despite all that some may say to the contrary, our timber resources are limited. It is within the recollection of the writer that Ontario could boast of her vast areas of unexplored forest, which according to some authorities of that time would last for generations. Where is it today? With the rapid development of our country which must follow in the wake of our great transcontinental railways, and with the further advantage of the Panama Canal thrown open to us to enable us to get into other parts of the world with our product, how long are our British Columbia forests going to last?

The writer was discussing this subject in the office of a large holder of British Columbia timber recently. He was enthusiastically sanguine, and made the statement that he could cut fifty million feet per year for fifty years off his holdings, and at the end of that time have more timber than he has now. I laughed at him, but he pointed to photographs on the wall and wanted to know if I was prepared to tell him that with his large holdings of such timber, the growth would not exceed fifty million feet per year. I have forgotten what he said his holdings were, but perhaps some of the readers of this article can figure it out from the figures which I have given you.

Sweeping Reforms Required

I believe that instead of the lumber business standing as it does at the present time,—practically in discredit as a business in which to be found engaged, it can, and should be made one of the most

honorable, and most profitable industries in which we could engage. I believe that the time is now past due when sweeping reforms should be brought about. Practical conservation all along the line should be made not only a problem, but a theme with every one whose position demands an exercise of judgment on their part in this direction. I believe that our government should take all due precaution in bringing about reforms which will work to this end, without working undue hardships on the already badly hampered industry. The problem is a big one, and considering the conglomeration of interests involved it is a difficult one, but it will be found well worth while, for I believe it can truly be said of it that an ounce of conservation will be worth more than a pound of reforestation. Where God has grown so many of those monarchs of the forest of British Columbia, men could never succeed in doing likewise.

The Devon Lumber Company's Operations

The Devon Lumber Company, Limited, who are operating in the district of Sudbury, Ont., are putting in three large camps this winter, cutting white pine, Norway pine, and jack pine. The output will be about ten million feet annually. Devon Station is located about four miles east of Chapleau. Their post office address is Pine, Ont. At this point the company have a splendid new sawmill, with a capacity of about 125,000 ft. per day. The equipment includes a double cutting band saw, a circular gang, twin circulars for making ties and slabbing, a lath and shingle mill, and all other machinery that is necessary to complete a mill of this kind.

Mr. W. B. Bartram, of Bartram Bros. Limited, Ottawa, Ont., is the managing director of this company, also of Bartram Bros. Limited.

Bartram Bros., Limited, will be the sales agents of the Devon Lumber Company. The president is Mr. F. N. McCrea, of Sherbrooke, Que. The other members of the company are: G. F. Hodgins, Shawville, Que.; T. A. Low, Renfrew, Ont.; Colin M. Bartram, Ottawa.

Death of a Pioneer Winnipeg Lumberman

Alex. Black, one of Manitoba's pioneer lumbermen, died recently at the age of 66. The late Mr. Black was born in Edinburgh in 1847 and received his education there. He settled in Montreal in 1868, where he followed the business of a contractor for fourteen years. In 1882 he moved to Manitoba and went into the lumber business. Ten years ago, Mr. Black formed the company known as The Alex. Black Lumber Company, of which he was president until the time of his death. He also established a number of retail lumber yards. Andrew Black, foreman of the Alex. Black Lumber Company, is a son of the late Mr. Black. Mr. Black was also a director and valuator of the Home Investment and Savings Association. Outside of his business connection Mr. Black was best known as one of Winnipeg's most successful curlers. He had only recently returned from a trip of several months spent in the Old Country, during which time he visited the scenes of his early life.

Tendering for Toronto Harbor Timbers

R. Stanley Dollar, the well-known lumberman, of San Francisco, is reported to have tendered for the supply of thirty-five million feet of timber for the new harbor works at Toronto, for delivery in 1915. Mr. Dollar was recently in Montreal making enquiries into facilities for water shipment for the timber, which would reach Montreal by way of the Panama canal. He found that plenty of lake freighters would be available passing up the river from Montreal light, and that there would be no difficulty in securing water transportation, at reasonable rates. Mr. Dollar's tender is likely to stir up considerable interest among Canadian manufacturers, as it has been announced that the government will give preference to Canadian timbers, so long as other conditions are equal.

Inspecting Camp Conditions

The Department of Labor at Ottawa is reported to have received rumors to the effect that employees in lumbering camps in Ontario and Quebec were not, in some cases, being given the comfort and attention to which they are entitled. Officers of the Department are being sent on a tour of inspection into a number of the camps in both provinces, in order to see that the sanitary conditions are kept up to the standard required by the government.

Simonds Company Elects Officers

At a meeting of the board of directors of the Simonds Manufacturing Company, recently held at their executive offices at Fitchburg, Mass., the following officers were elected: Alvan T. Simonds, president; C. F. Braffett, H. A. Sargent, and T. F. Howarth, vice-presidents; G. K. Simonds, treasurer; H. K. Simonds, assistant treasurer; and J. E. Kelley, secretary.

Southern Lumbermen Discuss Trade Problems

A number of interesting addresses were delivered recently at a banquet at the Lumbermen's Club of St. Louis, Mo., at which the architects of the city were the special guests. Many architects were in attendance and the subjects discussed were of much interest. On account of the general nature of the subjects referred to in the addresses, we take pleasure in reproducing some of the remarks, as they bear, in an interesting manner, upon many of the issues which are of importance to the lumber industry and trade in Canada to-day.

The first speaker on this occasion was Mr. J. B. White, of Kansas City, Mo., who spoke particularly of the Conservation situation, a subject which he has made peculiarly his own. In the course of his remarks he also said:—"The duty and helpful office of the architect is to practically help mould public thought to know the varied uses of the various woods, that it may be profitable to grow such trees as will grow most quickly and produce quickest returns upon the capital invested. He should educate the user not to search for substitutes, but to use the best wood for purposes required; not to select a wood for outside work that quickly decays, but to use the quick-growing sap woods for interior use, and the heart wood of the same species for outside work; or to use paint and wood preservatives for such outside work, where the sap woods can be most useful when properly treated and made equally durable with other slow growing species and capable of withstanding the ravages of time equally well. Whatever is used as a substitute to imitate wood is an acknowledged compliment to the real article, but is an injury to the cause of forestry and agriculture and to the comfort of mankind.

"The great talk of the increasing cost of lumber is a story started and maintained by our substitute competitors. The prices of hogs, cattle, corn and other farm products will buy more lumber now than at any time in the history of the country. Both they and lumber must bring a sufficient price to make the cost of production profitable. They talk of our vanishing forests. There will always be forests to supply all demands. The forests of Austria, Switzerland and some other European countries are increasing and Austria is now exporting immense quantities of lumber from her rapidly growing forests.

"Our architects can design and build all or half timbered houses, so that there is little danger of fire. I understand that the National Paint Manufacturers' Association and the National Lumber Manufacturers' Association have recently perfected a fire-proof paint, which is to be patented by the two associations jointly, for the benefit of wood construction. The annual expenditure of advertising some twenty odd different substitutes for wood aggregates over three million dollars a year."

How Grading Has Helped Yellow Pine

The importance which systematic grading and inspection of yellow pine have been to the manufacturing industry in connection with that wood, was described in an interesting manner by Mr. White, who said:—"The rules adopted thirty years ago for grading yellow pine have been improved upon until they are now the universal law wherever yellow pine is sold and used in the United States. Necessity forced us to this action, for in 1880 there were but three grades officially recognized in the city markets—clear, common and culls, and the mayor appointed the inspectors, and as he knew and cared more about politics than lumber, he very naturally appointed those inspectors whom his constituents of the Lumbermen's Board of Trade recommended.

"We were 'up against it' as the boys say. I had sold a lot of lumber in St. Louis and was charged up with culls, cost of inspection, switching charges, unloading, discount for cash, etc., and I came up to see what was the matter. I called at the office and was told to take a seat in an adjoining room and was handed the morning newspaper, while the proprietor had a talk with a gentleman who came in about the same time. The door was open, and this is what I heard in a low tone:—

"Mr. P., I called to inquire what is wrong that I did not get the inspection of that last consignment of lumber you received."

"The answer was, 'Well, Jim, I don't think you treated me just right on the last inspection. I like Jones' inspection much better.'"

"The inspector replied, 'Well, Mr. P., if you will give me another chance I believe I will satisfy you.'"

"All right, Jim," was said, and the inspector went out, and I had learned the rules of inspection in practice in St. Louis and some other cities, and I settled the best I could and went to my mill and issued a call for a meeting of lumbermen to form an association to do away with such practices and to adopt a system of rules that should wisely govern such a large and valuable industry as ours.

"We succeeded beyond our expectations. The association grew. We put inspectors in the field who were practical lumbermen and their judgment satisfactorily settled disputes between buyer and seller. They visit the mills of the manufacturer at regular intervals and keep our mill graders in line, and thus help to reduce the minimum claims at market centres. And, as a result of this organized effort, it was possible to arrange with the chief architect of the World's Fair, here in St. Louis, ten years ago, to specify the standard sizes as adopted by the Yellow Pine Manufacturers' Association for yellow pine lumber used in the Fair buildings, which amounted to over four hundred million feet, and now there is a practical uniformity of grades and sizes everywhere and we are still progressing, and we need in this good cause the educated assistance of the architects and students of the uses of wood throughout the country."

Mr. R. A. Long, of the Long-Bell Lumber Company, St. Louis, Mo., was the next speaker. He quoted from a bulletin of the United States Forest Service, stating that there was now about 252 billion feet of standing long leaf pine and 132 billion feet of short leaf pine, making a total of 384 billion feet. Cutting at the rate of 15 billion feet annually would require thirty years to consume all this timber, to say nothing of the other great forests of the country. When yellow pine had passed out of existence, they would still have in great quantities timber on the Pacific coast, that would last from fifty to seventy-five years, to say nothing about the re-forestation that would be going on in the meanwhile.

Referring to the supposed high price of yellow pine to-day, Mr. Long said:—"Some 25 years ago we handled our first car of Star or 'B' yellow pine flooring, costing \$32 per M. delivered at 22 cent points. The grade called by the same name to-day is at least 40 per cent. better than then, and is selling from \$22 to \$24.50 per M. Supply and demand is going to control the price of lumber, as is true of everything else. Stumpage is selling to-day at about \$5 per M. So long as the price of stumpage remains at \$5, the price of lumber will vary, as it has done this year, sometimes selling at from \$4 to \$6 per M. less than at other times. We are now getting at least \$4 less than on June 1st of this year, so it may be expected that the conditions will change with supply and demand."

In conclusion Mr. Long said:—"I feel well assured that we retailers should spend more money in order that the product which we handle may be kept more thoroughly before the consumers of our country than has been true during recent years, and we sincerely trust that we may have the co-operation of our architects in the encouraging of the use of lumber where they can do so consistently with the interests of their clients."

The Lumberman and the Contractor

Mr. Julius Seidel, St. Louis, Mo., the last speaker of the evening delivered a very interesting address on the subject of, "Lumber—Its Uses and Abuses," in the course of which he said:—"Under our contract system in this and other cities there is a general contractor who is commander-in-chief on the job. Formerly the general contractor was by profession usually a carpenter. To-day a stonemason, bricklayer or concrete operator takes charge with equal success. Lumber is specified under carpenter work. There is no sponsor for lumber except the carpenter, whereas the other materials which are competitors of lumber reach the architect direct. This will remain so unless we change to the sub-letting system for lumber. For this reason the general contractor of to-day is not especially concerned whether they use joist or concrete, wood floors or tile, metal or wooden lath, slate or shingles. We lumbermen have got to be more in touch with the men who prepare the plans so that lumber receives its proper recognition and consideration.

"There is a lot of talk we hear about lumber being cut out. Talk of absolute hardwoods as walnut, cherry, apple, ash. Approach one of these men who talks about the matter and he will tell you that he 'understood' walnut and cherry were hard to get. These species and many others are not commercial for building work.

"The fact is, we are furnishing lumber from other fields for commercial use, equally as good and perhaps better adapted to certain uses than has been used in the past. There are 50,000 mills in the United States which will substantiate my remarks that there is plenty of lumber still available.

"And now a work of practical common sense. Lumber must be used with due regard to its qualifications for the respective purposes. You use different kinds of brick for the reason that the old hand-made brick would be worthless to-day for certain places and under certain conditions. Shale, vitrified, hard red and other species are used to-day with success when laid in cement in place of the old time brick made by hand and laid in lime mortar years ago.

"The mill man or lumberman has not been asleep to the necessity of preparing lumber for present day's uses; but very little of the information reaches the architect's ears and that's our mission to correct. The saw mill man, however, has been getting away from the consumer, owing to the distance between the source of supply and the markets

of use, and for the further reason that so many kinds from different localities enter into competition in the same territory. The modern lumber yard assembles all of the various woods produced for building construction work that are called for in their cities and keeps them ready for quick supply.

"But even the yard does not reach directly the ear of the architect when lumber is specified under 'carpenter work.' The architect does not get the information that should be before him as to what constitutes commercial sizes, standard grades, standard lengths.

The Benefits of Standardizing

"I will not take your time to go into a lengthy history of the standardizing, but would briefly mention that there is a fixed standard of thickness for rough or dressed posts, beams, joist, sheathing and flooring, likewise a standard width and standard grading rules.

"When you get joist or scantling from a yard, the thickness and width is just the same all the year around, furthermore, the standard is the same with every yard. When you lay a floor you do not need to fit out the run of one width as you did when it was worked $2\frac{1}{2}$ to $5\frac{1}{2}$ inches wide. Your entire house is laid of one width, $2\frac{1}{4}$, $3\frac{1}{4}$ or $5\frac{1}{4}$ inches. Your sheathing comes in one width, multiples of two-inch, formerly it was 7-inch and up, sometimes as wide as 24 inches. Now it is 4, 6, 8, 10-inch or 12-inch. It means better work at a less cost to do the work, when you get one width. The matching of flooring is under a standard of thickness and a standard tongue and groove.

"I cannot too strongly recommend that architects specify the finished sizes of lumber throughout. For instance, do not call for a 2 x 10 joist surfaced one side and one edge, but rather say $1\frac{5}{8}$ x $9\frac{1}{2}$ -inch when finished. Call for sheathing in the finished thickness, flooring likewise. For instance, do not say 3-inch flooring. It is misleading; rather call for 13-16 x $2\frac{1}{4}$ -inch face or $3\frac{1}{4}$ inch face. Confine yourself to the official grades, pick out in short the kind you want, be it a No. 1, No. 2, 'C,' 'B,' or 'A' flooring and avoid repeating a personal interpretation of a grade you want as the rules cover that all in one term. The owner may be critical and will not listen to your explanation that a $1\frac{5}{8}$ -inch thick is standard for 2-inch, so reverse your way of specifying and give the finished sizes on your plans and specifications."

"The lumber manufacturers' associations should long ago have had a technical committee with duties to give practical information when and where not to use their lumber and how to use it. This information should get both to the yard that sells the lumber, the architect who specifies it and the man who buys and uses it. The lumber journals also get out the finest stuff on earth, but the public does not get it to read. We are talking too much to ourselves about lumber and not enough to the men who use it.

"The saw mill and lumber yard will have to encourage the more careful and discriminate use of its product and afford the information as to a cheap method of so doing.

"The yard will, in my mind, at no far distant day, have to sell a wood preserver, creosote, oils and paint or have the co-operation of men who make these products. We must tell more about the various woods, where to use them and where not.

"The purpose of my remarks are to show:

- 1st. That lumber is in bountiful supply and of the best of kinds.
- 2nd. That it should be more discriminately used in the future than in the past if we wish to use it successfully.
- 3rd. That the mill men or lumber manufacturer and yard will afford you every means to get correct data as to supply, grades and proper use.

4th. That to get dry material and quick service you should regulate yourself to standard sizes.

5th. That we are all builders and all equally interested in the solution of problems that go to make better building a possibility.

"Let our united aim be in that direction."

Donald Barclay Returns to Toronto

Donald Barclay, formerly local salesman for the Canadian Western Lumber Company, New Westminster, B.C., has been transferred to Toronto as assistant salesman, where he will work in conjunction with Mr. Hugh A. Rose, the company's Toronto representative. Mr. Barclay will devote his time principally to the selling of the Canadian Western Lumber Company's shingles and doors in Western Ontario and also in the New England States. Toronto lumbermen will remember Mr. Barclay. Some time ago he was with the R. Laidlaw Lumber Company, Traders Bank Building, Toronto.

Mr. W. L. Miles, after nineteen years service with Wickes Bros. of Saginaw, Mich., has gone into the second-hand machinery field on his own account, paying special attention to gangs and other sawmill and woodworking machinery. Mr. Miles was, for over fifteen years, manager of the manufacturing plant and of sawmill machinery sales of Wickes Bros.

Utilization of Waste Wood

The utilizing of waste wood as slab edgings and the like for the manufacture of ground wood pulp, also known under the name of mechanical pulp, is the significant feature of a new machine invented and protected by Mr. Leo Schlick, M.E., 164 Bay Street, Toronto. Mr. Schlick is an expert and specialist in the design of pulp machinery, and he has succeeded, after exhaustive investigations and tests, in designing a machine capable of converting waste wood into a good, strong fibre pulp, suitable for paper and board making purposes.

Cheap white paper forms an important item in modern business, and as it is exclusively manufactured from wood, every means of eliminating the waste of raw material is of great importance. Slabs, edgings and waste wood in general, consist of good useful fibres, which, if properly treated, in a special machine, will give the same excellent fibres as the log itself. The new apparatus is based on well known scientific principles. The grinding process is maintained, and the machine itself is an ingenious combination of automatic charging of the pockets (thus eliminating labor) and a proper device ensuring the manufacture of strong and long mechanical pulp.

The cost of manufacturing pulp from waste wood is as 1 to 2, compared with the pulp made from logs. The machine is fully protected by a number of pending patents. The inventor states that the design of the machine is merely the solution of an engineering problem—as every engine or ordinary machine. Preparations are being made to push this machine vigorously and to build large units pulping all the waste of a lumber concern.

Atkins "AAA" Lumber Piling Jack

The accompanying illustrations show a new device which is now being marketed by E. C. Atkins & Company, the Silver Steel saw people. This will prove a welcome innovation in every lumber yard, as it insures the piling of lumber of all kinds without injury to its

No. 1

No. 2

surface. It also facilitates the piling of lumber on account of the ease and rapidity with which the work may be done.

The device consists of a head on which are mounted a series of pointed teeth. These being inclined slightly, enable the lumber to be pushed upward along their surface, but prevent it from slipping downward. The head may be easily revolved in any direction. A spring attached to the side of a head brings it to its original position as soon as the board releases it, so that the jack is always ready for instant action. The heaviest and widest boards may be handled without danger of marring their face or of splitting, as is apt to occur where a pointed stick or post is used.

No. 1 is to be attached to a square pole and inserted between the layers of lumber at any point desired. No. 2 may be fastened to the top of a 4 x 4 post or to the upright of a yard stick.

Atkins "AAA" Lumber Piling Jacks are now ready for delivery. Full information and illustrated circular may be secured by writing to E. C. Atkins & Company, at Indianapolis or any branch houses.

The First of the Calendars

The C. A. Larkin Lumber Company, Limited, Toronto, Ont., with their usual enterprise, are the first in the field with a calendar for the year 1914. The calendar, which they have sent out to their friends in the trade, is indicative of their good business sense as it is an ideal one for a busy office. It consists simply of large numeral type upon a green background, the company's name being displayed in large type across the top. Those who receive copies of this calendar are very certain to display them prominently.

Mr. James W. Sewall, of Old Town, Me., with Mr. O. W. Madden of his staff, have returned from cruising a large area of timber lands in Washington and Hancock Counties, Maine. They report a warm, wet fall, with exceptionally high water in the streams and rivers.

Canada cuts about two million cords of pulp wood annually, about half of which is exported for manufacture in the United States.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

WANTED—Hemlock or Spruce Logs or Lumber. Apply to Box 905, Canada Lumberman, Toronto. 22-23-24-1-2

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

WANTED—2 inch spruce for 1914 delivery. Full thickness merchantable spruce, culls out. 2 x 5, 2 x 6, 2 x 7, 2 x 8, mostly 2 x 6 and 2 x 7, 9 feet and up, to average 16 feet long. Cash Buyer, Box F, Rutland, Vt., U.S.A. 21-24

Hemlock, pine or spruce logs wanted, 15,000 to 20,000, for immediate or later shipment. Give full particulars. Box 100, Canada Lumberman, 119 Board of Trade Building, Montreal. 21-24

WANTED

1½-in. 2-in. 3-in. and 4-in. Hard Maple. 1-in. 1½-in. and 3-in. Soft Elm. 1-in. Basswood and Ash. Can use Log Run. State what you have and lowest cash prices. Box 910 Canada Lumberman, Toronto 22-23

Wanted to Buy

We are in the market for the following: 1,000 35-ft. and up Cedar Poles. Odd lots of Spruce and Pine. Square Timber. State best prices net cash. Delivery coming season. Apply P. O. Box No. 1595, Montreal, Que. 21-tf.

Hardwood Pickets Wanted

Beech, Birch and Hard Maple.

1 x 1 x 42.
1 x 1 x 48.
1 x 1½ x 42.
1 x 1½ x 48.
1 x 1¾ x 42.
1 x 1¾ x 48.

Require Thickness, 1/16-in. Plump. Quality—Free from all defects.

Can take delivery of green or dry stock. Apply to The Canada Wood Specialty Co., Ltd., Orillia, for full particulars, price, etc. 24-1-TF

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

For Sale-Lumber

For Sale

Peeled cedar post 4½-in. to 7-in. top, 8 ft. long. Best of quality and made from green cedar. Chas. Pedwell, Lions Head, Ont. 9-tf.

For Sale

500 cords Tan Bark. All sizes Hemlock Timber, same cut off deeded lands. Apply to CANADIAN COPPER CO., Coe Hill, Ont. 21-24

For Sale

50,000 ft. 4-in. Hard Maple, 6 to 10 inches wide, largely 12 ft. long, and consisting principally of tight Boxed Hearts. For prices and full information, address The London Lumber Co., Ltd., London, Ont. 22-23.

For Sale

260 M. ft. 5/4 No. 1 C. & B. Basswood.
40 M. ft. 6/4 No. 1 C. & B. Basswood.
2,500 ft. 8/4 No. 1 C. & B. Basswood.
2,300 ft. 16/4 No. 1 C. & B. Basswood.
10 M. ft. 4/4 No. 1 C. & B. Basswood.
J. AUSTIN & SONS, Kinmount, Ont. 23-24-1-2

Cedar Posts

We have a quantity of 15 M. 8 ft. posts for sale. Shipment to be made on first snow. The Fletcher Pulp & Lumber Co., Ltd., Sherbrooke, Que. 23

Wanted-Machinery

WANTED—Steam Log Loader. Trenton Cooperage Mills Limited, Trenton, Ont. 23

WANTED—One pair twin circulars, for slabbing logs down to 4 inches and up. Must be in good condition. Apply 524 Board of Trade Bldg., Montreal. 23-tf.

WANTED—One pair steam engines, capable of developing 500 h.p. for sawmill. Must be in good condition. Apply 524 Board of Trade Building, Montreal. 34-tf.

For Sale-Machinery

CORLISS ENGINES—GUARANTEED 100 to 1,500 horse power, simple or compound; standard Makes; ready for service; no repairs needed; special bargains. General Equipment Company, Box 134, Syracuse, N.Y. 20-23

Machinery For Sale

1 Brown Automatic Engine, 14 in. x 36 in., 100 h.p., in good condition, with belt 16 in. x 120 ft.
1 Sturtevant Fan, 110 in., direct connected to 6 in. x 5 in. twin cylinder engine.
A snap for quick sale.

JOHN TAYLOR & CO., LTD., 531 Front St. East, Toronto. 21-24

Woodworking Machinery For Sale

1, 18-in. Ideal wood lathe; 1, 12-in. MacGregor-Gourlay four side moulder; 2, 8-in. three side moulders; 3, 24-in. Champion planers, matchers and moulders; 1 combination rip and cross-cut saw table; 5 Ideal variety saw tables; 1 contractors' portable saw table connected to gasoline engine; 1, 2.5 gallon Advance glue heater with warming chambers for 8 2-qt. glue pots. H. W. Petrie, Limited, Toronto, Montreal and Vancouver.

Wickes Gang

A first-class machine at a bargain. 23-24-1-2 W. L. MILES, Saginaw, Mich.

For Sale

Saw, shingle and planing mill for sale on Robertson Lake, 3 miles from Lavant Station. K & P, 50 h.p. Engine, 65 Boiler, 3-saw Edger, good running order. 1,100 acres timbered lots, plenty of timber available, good planing business, and opening for sash and door. Good reason for selling. James Umpherson, Lavant Station, Ont. 20-23

Woodworking Machinery For Sale

1—No. 1 Ballantine power feed dowel machine; 1—2½-in. Waymoth variety lathe; 2, 24-in. Ideal planers, matchers and moulders; 1, Goldie & McCulloch 2-spindle wood shaper; 2, 6½-ft. iron frame swing saws; 1, 30-in. Cowan bracket band saw; 1, 36-in. Egan double drum sander; 1, Cowan double head panel raiser; 21 Cowan veneer-press screws.

H. W. PETRIE, LIMITED,

23 Toronto, Montreal and Vancouver.

For Sale at a Bargain

1 10 in. x 10 in. Simplex Pump.
5 Steam Engines.
1 Killam Stock Gang (New).
1 Mitts & Merrill Hog, No. 20, 10 in. x 12 in.
1 Ricker with 30-in. Saw.
1 St. John Iron Works Driving Gear for Band Saw Carriage.

Edger, Planers, Shingle Machine, Chain Blocks, Trolleys, Saw Arbors, Pulleys, Rotary Saws, and a large lot of Steam and Mill Fittings.

Address, T. N. McGRATH,

20-tf. Tusket, N.S.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

Man with 23 years' experience as Sawlog Culler holding government license, desires position as Sawlog Scaler. Apply, stating salary, to Box 912, Canada Lumberman, Toronto. 23

BOOKKEEPER—Advertiser open for permanent position. Am expert bookkeeper. Accustomed to lumber, general merchandise or factory. Systemizer of bookkeeping. Will give A1 results. Address Accountant, Box P, Widdfield Station, Ont. 23

Experienced hardwood buyer and inspector with good connection in Northern and Eastern Ontario is open for engagement with a good lumber firm. Toronto wholesale and retail yard preferred. Large experience in American shipments, and thoroughly understands grading in native hardwoods. Some experience in Quebec, and has some knowledge of selling. Address Box 915, Canada Lumberman, Toronto. 23

Expert Bookkeeper, executive ability, young married man, wholesale and operative experience, sawmill and planing mill, box factory, white and yellow pine. Fourteen years and no lost time—desires change. Salary secondary consideration where there is good opportunity for advancement.

A. J. BAKER,

21-24 2112 Twelfth Avenue No. Birmingham, Ala.

WANTED—By man who thoroughly understands the lumber and shingle business from the stump to the car—position as Manager, or would engage as Superintendent of good sized plant, or construction of one. Good organizer and manager, scientifically correct on mechanical end, and can get results. Coast and Eastern experience designing, constructing, and operating big works. Eleven years in present position. Best reasons for changing. Evidence to satisfy the most exacting is yours for the asking. Box 899, Canada Lumberman, Toronto. 22-23

BAND SAWYER—Open for position for coming season, right or left hand mill. Experienced cutting pine, hemlock and hardwood, for quantity and quality on fast mills. If you can offer good wages for day work, write Box 902, Canada Lumberman, Toronto. 23

General Manager of Lumber Company manufacturing 30 million feet annually (White Pine and Spruce) wants position in wholesale or retail lumber business. Salary four thousand dollars. Well known to Ontario, Quebec and U. S. trade. Grading experience in hard and soft woods. Would consider purchase of interest in established business. Apply Box 911, Canada Lumberman, Toronto. 23

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Experienced man to buy logs and operate sawmill. Married man preferred. Must furnish references. Apply Box 917, Canada Lumberman, Toronto. 23-24

Business Chances

For Sale—Planing Mill

A going concern. Consisting of lands, buildings and machinery in good live town, Waterloo County. A. C. Bender, Real Estate, Berlin, Ont. 23-24-1-2

Bargain if taken before January 15th. Tug Marie Louise, length 65 feet, beam 15 ft., 50 h.p., steam 200 pounds. Hull rebuilt 1911-12, fully equipped, electric lighted, cookery outfit, sleeping accommodation for 7 men. Also two scows.

The Baker Lumber Company, Ltd., 23-24-1-2 Lindsay, Ont.

New England Salesman

Desires commission proposition from large manufacturers or distributors for the New England States. A trade is now worked and controlled assuring the sale of at least 500 cars per year. Make appointment for meeting in New York or Boston, or submit proofs. Box 913, Canada Lumberman, Toronto. 23

Pulpwood Land

2,500 acres in one township on Lake Superior patented (freehold land) for sale cheap. This is a good opportunity for an operator or anyone wishing to go into the pulpwood business to secure a fine block of timber at a very low price and receive the highest price for their wood, viz.: \$7 to \$7.50 per cord for rough unpeeled over rail of boat. 5,000 acres in different townships, 160 acre lots patented (freehold land) for sale cheap. For further particulars apply

MULHOLLAND & CO.,

23-tf. McKinnon Bldg., Toronto.

Business Chance

Saw Mill and Lumbering Outfit complete with adjoining 500 acre limit situated in the Township of Widdfield in the District of Nipissing at mileage 11¼ upon the Temiskaming and Northern Ontario Railway. Bargain for quick sale. For further particulars apply to W. D. Parks, Box 232, North Bay, Ont. 22-23

Saw Mill For Sale or Lease

What is known as the Micnic Island Mill at Little Current. Cutting capacity 140 M. inch lumber in 10 hours. In first class condition.

Possession can be given 1st January next. For further particulars apply to

THOMAS CONLON,

21-tf. 44 Church Street, St. Catharines, Ont.

Sawmill For Sale

In the centre of Pembroke, Ont., Sawmill and machinery, daily capacity 20,000 feet B.M. One acre of land around mill and three acres lease adjoining. Will sell machinery separate.

BARR & MORRIS,
Pembroke, Ont.

Canada
Province of Quebec
District of Quebec
No. 1934

Superior Court

In the matter of

H. M. Price & Co.,

Lumber Merchants,
Quebec, INSOLVENT.

Public notice is hereby given that on Wednesday, December 17th, 1913, at 10 o'clock a.m., the Timber Limits hereinafter mentioned will be offered for sale by public auction at the office of Messrs. LaRue & Trudel, Accountants, Dominion Building, 126 St. Peter Street, Quebec:—

No.	Miles.

JOINT CURATORS 22-23

Sale by Auction of Valuable Timber Limits

PUBLIC NOTICE is hereby given that the Timber Limits hereinafter mentioned will be offered for sale, without reserve, by public auction, on the 17th day of December, 1913, at ten of the clock in the forenoon, at the office of Messrs. LaRue & Trudel, Accountants, Dominion Building, No. 126 St. Peter Street, in the City of Quebec, viz:—
Limit No. A, River St. John, containing 28 square miles, more or less.
Limit No. B, River St. John, containing 40 square miles, more or less.
Limit No. 2, Salmon River, containing 41 square miles, more or less.
Limit No. 3, Salmon River, containing 74 square miles, more or less.
Limit, Rivers Chambers and Salmon, containing 77 square miles, more or less.

CONDITIONS OF SALE

1. The purchaser will pay, in addition to the purchase price, payable cash on transfer of the licenses, the auction duty of one per cent., and the transfer fee payable to the Crown Land Department of the Province of Quebec, on the transfer of the licenses.

2. The purchaser will take the said limits subject to all and singular the conditions of the licenses issued by the Department of Crown Lands for the Province of Quebec, and without warranty on the part of the vendor, save that the licenses have been issued and are his property.

3. The ground rent payable to the Department of Crown Lands in respect of the said limits has been paid up to the 30th of April next (1914).

4. Intending purchasers will have an opportunity of perusing the licenses by applying to Messrs. LaRue & Trudel, at their office, Quebec.

Rutland, Stuart, Grant & Thomson,
Solicitors for Vendor,
56 St. Peter Street, Quebec.
22-23

For Sale

Planing Mill, Sash and Door Factory. Mill in good shape and machinery all in operation. F. J. Moore & Son, Lakefield, Ont. 19-24

For Sale

Bargains in Shanty Sleighs. 17 sets at \$10 per set. Box 906 Canada Lumberman, Toronto. 22-24

For Sale

Lumber Limits in Eastern Canada, 50,000 acres, large Sawmill, fully equipped going concern, on salt water. Correspondence solicited. Will be sold right to close estate. Address, Timber Limits, care Canada Lumberman, Toronto. 22-t.f.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. 22-t.f.

Planing Mill, Sash and Door Factory

The best proposition in Ontario. Electrically equipped and new plant. Controlling interest for sale cheap by party engaged in other line of business. Exceptionally good opening for practical business man. Box 535, Port Arthur, Canada. 22-23

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

For Sale

Timber limit consisting of 10,000,000 feet of Pine, Spruce, Hemlock and Hardwood, tributary to Lake Nipissing. Also sawmill and logging outfit, boom timber and chains. Good reason for selling. For particulars address Box 846, Canada Lumberman, Toronto. 19-t.f.

Miscellaneous**Wanted**

A market for Birch Dowels and Poplar Broom Handles. Apply Box 918, Canada Lumberman, Toronto. 23

Tenders for Pulpwood Limit

Tenders will be received by the undersigned up to and including Wednesday, the 31st of December next for the right to cut pulpwood on a certain area situated on the Metagami River in the District of Temiskaming.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the Crown dues of 40c per cord for Spruce, and 20c per cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario,—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario, for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into an agreement to carry out the conditions, etc.

The highest or any tender not necessarily accepted. For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, Ont., Sept. 17, 1913. 20-24

For Sale

Tugboat, 65 ft. over all, 14 ft. 3 in. beam, 8 ft. deep, fully equipped with winches, 10 and 20-in. compound engines, surface condensers and pumps. All connections and pipes brass and copper. Address T. N. McGrath, Tusket, N.S. 20-t.f.

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

South Yields Most Lumber

How rapidly the South is surpassing the West in the production of lumber is shown by the latest figures just issued for the United States.

While Washington, with a production of 4,099,775,000 feet in 1912, still holds first place in the country, the increase for that State was only 35,000,000 feet over the total for the preceding year. On the other hand, Louisiana, which was close behind last year, with a total output of 3,876,211,000 feet, showed an increase of 310,000 feet, while Mississippi, which was third, with a production of 2,381,898,000 feet, gained 340,000,000 feet over the previous year.

In 1911 Oregon was in third place, but last year gave way to North Carolina. Texas went up from eighth place in 1911 to sixth place last year. Arkansas dropped from sixth to seventh place. Virginia went up from twelfth to eighth. Wisconsin dropped from seventh to ninth, Michigan held tenth position and Minnesota fell from ninth to eleventh place.

The figures show that the Southern States and the Pacific Coast States are the leading producing sections. Both showed an increase of output over the previous year, but the increase in the South was greater. The census for 1900 gave the Southern States 38.7 per cent. of the total output of the country. In 1907 this had increased to 45.7 per cent., and last year it was 51.4 per cent.

Among the various species of lumber produced yellow pine maintains its long lead, the total for that wood cut in the Southern States being 14,470,617,000 feet. Douglas fir was second, but a long way behind, with an output of 5,175,123,000 feet.

Dominion Timber Sale

The largest timber sale that has been made by the Dominion Government in British Columbia was made here Wednesday, when at public auction, timber booth No. 552, comprising 4428.8 acres, was bought by Mr. James C. Shields, of Vancouver, at the price of \$13,083. While this is the largest

tract that has been sold, the amount received by the government was not nearly so large as has been paid on several occasions before. Mr. Shields paid \$24,000 for much smaller tract two years ago, constituting a record price per acre for Dominion timber lands. This berth is situated on Spuzzum Creek, which empties into the Fraser near the town of Spuzzum, on the C. P. R. There is estimated to be approximately 150,000,000 board feet of excellent fir and cedar on the berth. It is proposed to build a sawmill on this tract, and to flume the lumber to the C. P. R., where an up-to-date planing mill will be installed.

Review of Current Trade Conditions

Ontario

The most important fact that one can gather by calling upon the lumber trade, or from correspondence, is that everyone wants to know how the others are getting along. The situation continues a doubtful one, but there are frequent reports of improvement which lead to a conclusion that trade is not by any means as poor as some were inclined to expect a short time ago. The alteration in the United States tariff is having a readjusting effect upon trade in Ontario and is assisting some lines considerably, notably spruce. Eastern spruce a few months ago was selling extensively in Ontario in competition with hemlock and yellow pine. Today, it is still an important factor in Ontario trade, but the price has stiffened. Quotations from eastern manufacturers are about \$2 higher than they were a couple of months ago, and the reason given is that the removal of the duty has improved the market for spruce in the eastern States, so that the quantity available for Ontario markets is smaller.

Ontario wholesalers report quiet trade, but a fair volume. Retailers seem to be keeping up a fair amount of business. Hemlock, on account of the competition of yellow pine, is not so strong as it was recently. Prices however, have not as yet shown any important change. Shingles are firmer, largely on account of the wider markets now available in the United States. Reports from British Columbia indicate that shingles are likely to advance early in December. White pine continues quiet.

No change of any importance is reported in connection with hardwoods. A fair amount of business is in progress, but wholesalers report that they have to work much harder than usual to secure orders. There is apparently nothing to worry about in the hardwood situation, outside of the fact that the trade is buying only from hand to mouth, because of the shortage of money. Reports of American trade in Canadian hardwoods are fair. Most of the factories seem to be fairly busy, but they are not anticipating the future and are buying only what they need at present. Prices on hardwoods in general have not altered and no drop is anticipated. A little improvement is noted in basswood and inch birch is strong. There is a fair general enquiry for hardwoods in car load lots.

Eastern Canada

No important change is reported in lumber trade conditions at St. John, N.B., and prices are about steady. A number of the mills are closing down at the end of November. A few of the larger manufacturers will run their plants until almost the first of the year. The English trade is very quiet, the market being over-stocked at present. It is reported that the English market now has the largest stock of deals on hand in many years, as a result of heavy shipments from outports during September and October. With a continuance of the present rate of consumption in England however, these stocks will probably be greatly reduced by Spring, because practically all deals have now been shipped from the north shore and other outports. St. John mills will not have over fifteen or sixteen million feet of deals to go forward. In the American market, prices show little or no change, although some reports have been made of an advance of 50c to \$1 per M. on schedule stock at Boston. Buyers however, are only purchasing small quantities. The base price for schedules at Boston is \$24.50. Merchantable spruce boards are bringing about \$16 at St. John mills and clears \$22.60 to \$23. Random is bringing about \$18. The local business has dropped off considerably during the past fortnight. Shingles are about 50c per M. lower than a month ago and sales are hard to make.

The New York market for eastern spruce is quiet, but prices are steady. Stock is arriving in sufficient quantities to keep the yards supplied. Fair sized enquiries are reported and competition is very keen. At Boston, the prices for eastern spruce are reported a bit firmer, but the volume of business is light. A steady demand is reported for hardwoods at New York, but the volume of business is small. Prices are fairly well maintained. There is a good demand for ash, birch and maple. Some improvement is reported in the demand for hardwoods at Boston. Prices are just steady. Hemlock continues in fair demand at New York, but the prices are not as firm as they were a month ago and yards are not buying far ahead. At Boston, the hemlock trade is small, but prices are fairly steady. Shingles are easier at Boston and a further drop of 10c is reported. Lath are about steady and the demand seems a little better.

Great Britain

Considerable activity is still noticeable at the London docks, but the approaching close of the shipping season, and a marked depression

in the building trade, are having an adverse effect. Holders seem inclined to refuse business at the present levels, preferring to wait until the feeling of uneasiness has cleared away. Stocks of deal sizes at London are larger than usual. Stocks of batten sizes are normal. Planed boards and flooring are scarce.

At Foy, Morgan & Company's recent auction sale a lot of first, second and third spruce 3 in. x 8 in., 6 ft. to 22 ft., from Halifax brought £9 per standard. First Quebec spruce 3 in. x 9 in., 6 ft. to 9 ft. sold for £14 15s., with 3 in. x 8 in., 7 ft. to 9 ft., at £14, and 3 in. x 7 in., 6 ft. to 9 ft. at £13. For 3 in. x 6 in., 6 ft. to 8 ft. the price is £14.

At Liverpool, practically every branch of the soft wood business is dull. The consumption for the month of October compared unfavorably with that of the corresponding month in the preceding years. With very few exceptions, stocks are much larger than in 1912, as a result of greatly diminished consumption and heavy imports. The spruce c.i.f. market is very quiet with little or nothing offering. Freights have eased a little and shippers may be tempted to offer a little more freely. They are not likely to meet with much encouragement however, and prices will have to be low to bring out any business. A feeling of uneasiness is reported also in the spruce soft market at Liverpool, where a very large quantity remains on the quay unsold. This is the case particularly at Manchester and importers are showing an inclination to sell, rather than place large quantities in stock, in the face of a weaker freight market. The demand for consumption is not encouraging.

No change is reported in the birch market at Liverpool. Shippers are apparently holding out for their ideas of value, and stocks offering are light. Planks remain normal, and no extensive arrivals are expected. There is a good demand for immediate consumption, but no speculative buying. Stocks are ample for present requirements. Pitch pine c.i.f. values show no important change, but the market is already over-stocked and the demand shows signs of falling off.

Stock reports from Manchester show that at the end of October the consumption was lower in practically every instance and stocks were higher than they have been for the past three years. The situation is one which should discourage shipments on consignment. Spruce deals at Manchester have been moving into builders' hands a little more freely, but no one apparently will make any money on spruce this year. The extensive arrivals of stock this fall have kept prices very close to the cost line.

The lumber trade at Glasgow shows a little encouragement, compared with other large ports in the United Kingdom. More movement is reported both from stored stocks and in shipments on the quays. The end of the Quebec shipping season has induced merchants to pick up certain stocks to carry them over the winter.

United States

Opinion is pretty evenly divided among United States lumbermen, and in fact among business men in general, as to the business outlook. One may find many men who are of opinion that, after the first of the year, a general activity in industrial development will take place. Probably just as many may be found who believe that the present quiet conditions must continue longer before improvement is expected. Whichever may be right, there is little disagreement regarding present conditions. Bankers continue their cautious policy in regard to loaning money for investment and most of them are opposed to the proposed currency bill in its present form. Business men are practically marking time, waiting to see what will develop during the next few months. Buying for the future has practically disappeared. The large interests who generally buy three and four months ahead are only filling their immediate requirements. The iron trade seems to be finding lower levels of price and the railroads still remain out of the market.

In the lumber business, trade is practically all in small lots for immediate delivery. Both dealers and consumers have allowed their supplies to run low and are now looking for sufficient stock only to last them until after the new year. Probably not for many years have the retailer and the consumer approached the inventory period with stocks as low as they are at present. No noticeable improvement in the lumber trade is expected until after the holidays. There is every likelihood however, that, on account of short stocks in distributing yards, there will be some buying for quick delivery. A number of recent reports have indicated a slight improvement in the demand for yellow pine. Orders and enquiries are more plentiful and prices a little firmer. It is generally thought that this is the result of stocks having run exceedingly low, while the demand for building and manufacturing purposes

is well maintained. It is not likely however, that this will make any change in the hand-to-mouth buying in the immediate future.

Northern pine shipments by water have not been heavy of late, owing to the storms on the Great Lakes. Yards at Tonawanda, Buffalo, Cleveland, Toledo, Detroit, Bay City, Saginaw and Chicago are fairly well stocked and a reasonable trade is reported. Prices are steady. Low grade stocks at the mills are smaller than usual at this time of the year. In the upper grades, stocks are fairly plentiful. Stocks of low grade in the Saginaw Valley are very low. The trade outlook on the Pacific Coast shows a little improvement, enquiries being more frequent. Red cedar shingles, continue sluggish, with

prices about 5c lower than they were a fortnight ago.

There is a steady demand for moderate sized orders of hardwoods for quick delivery. Manufacturers continue to run as close to the wind as possible with their purchases. This however, is usual towards the end of the year. Northern hardwood wholesalers report a fair trade, with birch and maple particularly strong. Stocks in manufacturers' hands are not heavy and prices are firm. The demand for hemlock continues about steady, but stock is being bought only for early consumption. The hemlock market at Buffalo is not as strong as it was earlier in the year, but is being aided by fair weather. Prices are reported a little weaker.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John Trade Continues Quiet

St. John, N.B., November 24th (Special to the Canada Lumberman): The lumber trade at this port is going along at a fair pace, with little or no change in prices during the last two weeks. All the mills are still sawing, but a number of them will close for the winter season on or about November 29th, being forced to shut down on account of the mill hands leaving to work at the winter port in loading of the steamers. This has handicapped the mills very much for a number of years, and while the owners would prefer to operate their plants until about Christmas, the employees leave without practically any warning and thus force a tie up. Messrs. Randolph & Baker, Stetson Culter & Company, and one or two other plants will continue to run well up to the first of the year.

Very little lumber is being shipped from here either to the English or American markets, as no inducements are being offered in these markets. The English market is very much overstocked at present, having the largest stock of deals on hand which they have had for many years. This has been caused by the very heavy shipments made from outports during the months of September and October. While stocks are heavy at present, the shippers feel that should consumption keep up to present level that by spring the stocks will be much lower than for some time, as practically all the deals have been shipped from the north shore of New Brunswick, and other outports of New Brunswick are cleaned up, as well as all of Nova Scotia, and because of the strike, only a limited quantity of English deals will be ready for shipment during winter from this port. In fact, there will not be over 15 or 16 million of deals to go forward from the St. John mills. Freight by liners will not be as high as in the past winter.

The cut of rotary deals for the winter will not be as heavy as in 1912-13, as the prices offered by the buyers here do not warrant the placing of these small mills in the woods. The buyers only offer about \$14 per M. for the ordinary specification of English, for winter or early spring delivery. As scantlings, ends and fourths go in at a much reduced price it leaves no margin of profit for the operator; he having to pay higher stumpage than ever before. Labor and supplies are as high as last year, and the price for deals is about \$1.50 to \$2.00 per M. less. Of course the city mills prefer to see these rotary or "Jack knife" mills out of business as they have a great tendency to weaken the market and they also effect the rates of stumpage and pile up a lot of low grade stock, which comes into competition with them, both locally and abroad.

Prices in the American market remain about same as last month, although it is said that some are getting 50c to \$1.00 per M. more on schedule stock in the Boston market. Orders however, are limited, and buyers are not in any mood to purchase anything but small quantities. The base price for schedules at Boston is \$24.50. Sometimes it is shaded up and down according to the needs of the purchaser and seller. Merchantable spruce boards are being sold for about \$16 at mills here, clears for \$22.60 to \$23.00 with the factories well-stocked with them, 2 x 3 in., 2 x 4 in., and 2 x 6 in., at \$16.00, 2 x 8 in. and up at \$18.00 to \$20.00, on short average stock, say 14 to 15-foot average.

Random 2 x 4 in., 6 in., 8 in. and 10 in. with some 4 x 6 averaging 50 per cent., 2 x 8 in. and up, 17 feet lineal sells for about \$18.00 on wharves here. Laths have been sold for \$3 on wharves at St. John during the last ten days, but mostly all the laths are held here by Stetson Cutler & Company and will not likely be shipped until spring or late winter. The quantities on hand are not excessive; as mills have only been running about 2 months and all laths were shipped preference to the starting of the mills after the strike. The daily output of laths is about 350 M. per day from all the mills here.

One small sale of English deal took place during the last month at about \$17.00 per M., but the seller was forced to guarantee at least

15 per cent. 11 in. x 3 in., 35 per cent. 9 in. x 3 in., balsam 3 in. x 7 in. and 3 in. x 8 in., which is one of the best sales of the year.

The pine market is not buoyant. Shipper pine is being held at from \$25 to \$30 per M. with very few orders to be had. Box pine is moving at a little better price than before, viz., about \$18 per M. on cars at St. John. Local business has dropped off considerably during the last two weeks as mostly all the large contracts here are well along, and business is not expected to revive in this line until spring. Refuse stocks are sufficient for demands, with the exception of refuse boards, which are increasing in demand always. Pine remains firm at \$10 to \$12 per M. on the yards at the mills, very little refuse is being shipped. The box business continues good and prices remain very firm, with orders coming freely.

Shingles are weaker by 50c per M. than a month ago. Where the low grades were selling rapidly, they have now fallen in line with extras and clears and sales are hard to make.

Higher Prices Expected at Ottawa

Ottawa, November 20th (Special to the Canada Lumberman): The condition of trade locally is generally regarded as fair, with no prospects of improvement during the next few weeks, for during that time lumbermen will be busy checking up their season's business and preparing for next season. When the manufacturers in the city and Ottawa Valley have totalled up their cuts for the past season the figures will show a considerable increase over last year, it is said, in spite of the unavoidable impediments, such as low water in the rivers in the district and the uncertainty concerning the American tariff changes, which prevailed before passed by Congress.

There have been no changes in prices during the past two weeks, but there are likely to be advances on all grades of mill culls before very long, consequent upon the rapid increase in the demand, which is out of proportion to the supply. If an increase is made it will be about five per cent.

Ottawa Mills Closing Down

With the coming of the first spell of severe weather the mills of J. R. Booth, W. C. Edwards Company, Shepard and Morse and Fraser and Company will close down. These are about the only mills that are still working in this district. Most of the men now employed in the mills will go to the woods and will probably be glad of the opportunity to do so, for work will not be very plentiful in the city this winter. Lumbermen say they do not remember when they received so many applications for employment in the camps.

Suburban building is likely to receive a set back if the Ottawa Electric Railway puts into effect on January 1st an increased rate on the Britannia line as proposed. For the past five years it has been possible to go to Britannia from any part of the city for a single fare. Consequently hundreds of first class homes have been built from the city limits to Britannia, a distance of five miles. Since the announcement of the proposed doubling of the fare, property has already taken a slump and if the company carries out their proposal the effect will not be in the interests of lumbermen.

When extensions now being made to the sulphite pulp mill of the J. R. Booth plant are completed it will be possible for the mill to turn out 125 tons of pulp per day instead of 50 tons daily as at present. The firm has not yet decided whether to rebuild the timber mills destroyed by fire some time ago. Men are now clearing the ruins away. If it is ultimately decided to build a new mill, work will not start on it before next spring.

An important sale of timber limits is being held in Ottawa on the first of December, when valuable pine limits in the Townships of Hammel and Merrick, in the District of Nipissing, are being offered by auction. The limits contain 35¾ square miles in all, being berths No. 6 and 8 in Merrick and berths 1, 2, 3, 4, 5, 7, 8 and 9 in Hammel.

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

J. R. Booth Recovering from Accident

Mr. J. R. Booth, who was seriously injured almost two months ago, is slowly recovering. He was able to sit out on the verandah of his home a few days ago for the first time since the accident, which broke his leg below the knee and inflicted other minor injuries, such as abrasions about the shoulder and general shock.

G. H. Millen and W. H. Rowley, heads of the E. B. Eddy Company, of Hull, left this week on a business trip to New York. After spending several days there they will go to Toronto and other Western Ontario cities and towns to look over the company's agencies there.

H. R. Erskine, manager of the paper and pulp department for J. R. Booth, is also in New York on business.

Hon. W. C. Edwards, head of the W. C. Edwards Company, went to Quebec last Tuesday with Mayor Ellis, of Ottawa, and other civic officials to interview Sir Lomer Gouin, Premier of Quebec, concerning getting assistance from the Quebec Government for the carrying out of the Gatineau Lakes water scheme for the city of Ottawa.

Montreal Market Letter—Trade Still Quiet

Montreal, November 24th (Special to the Canada Lumberman): No change of any importance is to be recorded in the lumber market. Some firms report that a fair volume of business is passing, having in view the time of the year, while others declare that trade is almost at a standstill. It would appear as if there is a shortage of stocks in the yards, one large wholesale house stating that nearly all the orders are of the rush character. Pine is said to be very slow, but without alteration in values.

A feature of the buildings during the past year, is the falling off in the number of dwelling houses. The permits taken out show a decline of about 1200 dwellings, as compared with 1912, which is no doubt due to the difficulty in borrowing money. The demand for houses and flats is now keener than ever, and, if the monetary situation were easier there would be a large increase in this class of construction.

Shipments to Great Britain and the European continent have been going forward at a great rate, and are now finished. The figures for the season, so far as can be gathered, will show an increase in pine and about the same quantity as last year in birch.

With regard to ground wood, all the pulp being manufactured is being shipped, together with a small amount from stocks. These are not considered more than sufficient to take care of any shortage that low water conditions may create during the winter. There are no changes in prices, and these will probably remain as at present, although it is likely they will go higher by February.

Chemical pulp quotations are weaker in London and New York, and there is an easier tone in the Canadian market. This is a reflex of a very quiet summer, and it will be probably mid-winter before normal conditions obtain. It is understood that the Canadian mills shipped their fall production this month.

Notwithstanding the talk about the large Canadian imports of news-print into the United States, the market is steady, the scare which the United States mills received, owing to the new Canadian production, being over. A stronger market will, it is believed, gradually come into existence. Some of the largest United States mills will not sell under \$43 per ton delivered.

In connection with Montreal as a lumber port, it is of interest to note that during the past few days Mr. R. Stanley Dollar, of San Francisco, has been investigating the facilities at Montreal for the water carriage of lumber intended for the new harbour works at Toronto. Mr. Dollar has tendered for the supply of 35 million feet for these works, to be delivered in 1915, and has in view sending the lumber by water from San Francisco to Toronto, via the Panama Canal and Montreal. The Harbour Commissioners have accommodation for the transshipment of lumber from the ocean vessels to the lake boats, and Mr. Dollar was informed that he would be able to secure the necessary room on the lake freighters. Mr. Dollar has previously sent lumber to Eastern Canada by water, but with the opening of the Panama Canal will avoid the long journey round Cape Horn and save a large sum in freight.

Quiet Demand at Liverpool

Alfred Dobell & Company, Liverpool, in their monthly timber market report under date of November 1st say: The aggregate import last month was on a fairly liberal scale. A quiet demand prevailed. Stocks of several important articles are much too heavy, but values remain without material change.

Canadian woods—waney board and square pine—A liner parcel of waney arrived on contract to Manchester. The demand remains languid and stocks heavy. Oak—A small shipment arrived at Manchester. Stocks are ample for present requirements. Rock elm—The

supply is very light. A fair demand existed. Prices very firm. Birch—logs were in fair request at unchanged quotations. Planks arrived freely. A steady demand prevailed for Quebec stock. Lower port planks were neglected and the stock is ample. Pine deals and boards—Liberal supplies came forward and met but a quiet demand. Prices firm. New Brunswick and Nova Scotia spruce deals—Import for the month to the Mersey and Manchester exceeds last year by 7,490 Standards, while the consumption is 1,070 Standards down, which no doubt is in whole or part due to the labor troubles. The combined stock stands at 36,080 Standards, materially more than any recent year.

Liverpool Market Report—Trade Still Quiet

Farnworth & Jardine's in their monthly wood circular dated Liverpool, November 1st, say:—Canadian Woods.—Pine timber.—The arrivals have again been moderate, but there is no improvement in the demand to report; values rule high. Waney Pine, 1st Class: The arrivals consist of about 800 loads large average timber to Manchester on contract, which go largely into consumption; the demand, however, continues very quiet, and deliveries disappointing, but there is little change in value to report; stocks are not too large. 2nd Class is only in limited request; stocks, though not heavy, appear sufficient. Square Pine.—No arrivals, but there is little enquiry. Red Pine is now very little used, and the small stock is ample. Oak.—About 13,000 cubic feet imported to Manchester on contract; the demand is quiet, and deliveries small, but stocks are moderate; values firm. Elm.—No arrivals; the deliveries have been fairly satisfactory; values are firm, and stocks moderate. Pine Deals arrived more freely; the demand is not brisk, and deliveries only fair; stocks are ample; values firm. Red Pine Deals are only in limited request.

New Brunswick and Nova Scotia Spruce and Pine Deals.—Imports to the Mersey (including Manchester) during the month were heavy, amounting to about 12,000 stds., against 4,500 stds. during the corresponding period last year; about 70 per cent. discharged at Manchester; the deliveries from Manchester stocks were satisfactory, but disappointing in Liverpool; stocks show further increase, and at both ports are too heavy. To effect sales lower prices have been accepted, but the import, as regards cargo shipments, is now practically over; further supplies are not wanted, and caution is imperative in consigning by the liners. Pine Deals are in limited request at steady prices.

Birch.—Logs.—Deliveries have again been small; but stocks are moderate, and values firm. Planks.—Arrived more freely; deliveries fair, and stocks are rather below corresponding month last season; values are steady.

British Columbian and Oregon Pine.—Arrivals have been by the liners, viz., about 28,000 cubic feet logs and lumber; prices are fairly steady, but stocks are sufficient for the limited demand.

Stocks at Liverpool and Manchester

Stocks of spruce, birch and pine at Liverpool and Manchester on November 1st were reported by H. W. Lightburne & Company, Liverpool, as follows:—

	Month Ending October 31st, 1913								
	Liverpool			Manchester			Combined		
	1911.	1912.	1913.	1911.	1912.	1913.	1911.	1912.	1913.

The will of the late Hon. John Sharples, of Quebec, P.Q., has been made public. The legacies and donations mentioned in it amount to \$1,500,000, and succession taxes, which go to the province of Quebec, \$37,000. Among the bequests was the sum of \$2,500 to each of the ten members of his office staff.

Record Revenue from Quebec's Lands and Forests

Montreal, November 17th.—In his annual report submitted to the Quebec Legislature, Hon. Jules Allard, Minister of Lands and Forests, states that the receipts of the Department for the year amounted to \$1,760,466.25, the greatest revenue ever received by that department. Part of this amount was derived from the sale of 194,091 acres of land at \$110,626.31, or \$149,236.14, counting in the amounts received on previous sales. The province has still 7,082,626 acres in its possession, but the chief revenue comes from the woods and forests department, the cutting licenses alone giving \$1,134,147.19, the rent \$330,203.09, and penalties, interest, etc., bringing the total up to \$1,510,171.41. 1,946 perfect titles were given during the year as against 1,899 during the previous year. The fire protection system was successful in preventing all but a few fires. Seventeen stations were established for observing the water-power of the province at all seasons, for the purpose of noting their adaptability for industrial purposes.

Result of Quebec's Export Prohibition

Hon. L. A. Taschereau, Minister of Public Works for the Province of Quebec, recently made a vigorous defence of the government's pulp and paper policy in the Legislature. He declared that excellent results had followed the prohibition of the exportation of Crown lands wood in any shape, except when manufactured. It was meant to prevent the exportation to the United States of pulpwood to feed the American mills. The government had felt that the needs of the United States were so great that the resources of the Province of Quebec would be drained to meet them in the course of time, and they believed that, by this prohibition, it would make it necessary for the American mills to be located on this side of the line. The result had amply justified their faith, and the first retaliatory measures undertaken by the United States had fallen through. The province had regained its position as one of the greatest producers of pulp, in support of which statement Mr. Taschereau referred to the establishment of the St. Lawrence Pulp and Lumber Corporation, which had invested three million dollars in the paper industry at Pabos; the Donnacona Company, at Portneuf, with two millions of capital; and the mills at Grand'Mere and Jonquiere.

St. Lawrence Pulp and Paper Corporation's Progress

Montreal, Nov. 11th; (Special to the Canada Lumberman).—The sulphite plant now being constructed by the St. Lawrence Pulp and Lumber Corporation at Pabos Mills, Gaspé, P.Q., will have a capacity of one hundred tons per day, while the sawmill, which is also being built, will turn out 150,000 feet per day of ten hours. In addition, the shingle mill will have a capacity of 200,000 shingles per day. The railway line to the bush will supply all the three mills. This line is completed a distance of about five miles and will be sufficient for feeding the mills for the next two years. The limit is about 650 square miles, and is rich in pulp and other kinds of lumber, principally spruce, balsam, cedar and birch. Shipment can be made to Philadelphia direct by water. The government are planning extensive harbour works for next season, and when completed they will be the finest on the Gaspé coast, and will be open for at least nine months of the year.

The building of the pulp mill is under the care of Mr. H. S. Ferguson, engineer, of New York. The new mill is being erected under the superintendence of Mr. J. E. Hamel, for the Waterous Engine Works, Brantford, Ont.; and the general manager is Mr. H. W. Racey, eleven years with Price Bros. & Co., as manager of saw mills and pulp mills, and for a time, general manager of the Big River Lumber Company, of Big River, Saskatchewan, a Mackenzie & Mann enterprise.

The following are the directors of the St. Lawrence Pulp & Lumber Corporation:—President, R. F. Whitmer, of Wm. Whitmer & Sons, Philadelphia, (who is also president of the Parsons Pulp & Lumber Co., and the Champion Lumber Co.); W. H. Sharpe, of Philadelphia, (President of the Jessup & Moore Paper Co., and Kenmore Pulp & Paper Co.); W. F. Fuqua, of Fuqua & Co., Bankers, Philadelphia; P. M. and F. Chandler, of Chandler Bros. & Co.; Frederick H. Ely, Attorney-at-law, Philadelphia; J. D. Campbell, of A. B. Leach & Co., New York; and George W. Robertson, of the Excelsior Coal Co., Shamokin, Pa.

U.S. Government Selling Philippine Timber

The United States Bureau of Insular Affairs has announced the first important sale of Philippine timber. According to the report of the forest officers of the Philippines, the islands contain two hundred billion feet of merchantable timber for which there is a large present demand. Practically all of it is owned by the government and is available under very favorable terms. In almost all cases the forests can be easily logged by the most improved machinery and methods.

The timber includes structural material of great value, in addition to many fine hardwoods particularly suited to cabinet work. In this latter class some of the most plentiful woods may be sold in competition with mahogany, such is their beauty of grain and richness of color. Manila is only two days' distance from Hong Kong. China, which has largely exhausted its timber, furnishes a ready market. Japan, Australia, and even the United States, will take Philippine lumber.

The Philippine bureau of forestry, in this first sale, is offering a twenty-year concession which gives exclusive rights to a tract comprising about 95,000 acres, and containing nearly two billion board feet of timber. It is required that the successful bidder shall keep up a certain minimum output which starts with fifteen million board feet during the first two years and increases to an ultimate output of at least twenty-one million feet per year. A modern sawmill and logging equipment must be established and also a patrol system for the prevention of fires and trespass.

The main body of the tract presents ideal logging conditions. Railroads can be built easily and cheaply and the entire timber belt can be logged at a minimum of expense and trouble. The amount of timber per acre varies from 12,500 up to 30,000 board feet and more. In the four principal types of forest embraced in the area, much valuable material can be secured from even the least desirable type, and the most valuable types will, according to figures of the bureau, provide a handsome profit for an outlay comparatively small in relation to the value of the timber which is to be exploited.

The principal kinds of wood are the lauans, excellent construction timbers and somewhat comparable, in mechanical properties, to the Pacific coast redwoods; yacal, one of the most valuable because of its great strength, and its resistance to destruction by white ants; apitong, quite comparable to the hard pines of the United States, and various other hardwoods which have already found a place as substitutes for mahogany.

It is required that the successful applicant shall furnish a capital sufficient for the immediate prosecution of the work, the amount in this case being placed at not less than 100,000 pesos, Philippine currency, equivalent to \$50,000. All bids for this timber will be opened in Manila on December 10, but arrangements have been made for extending the time for prospective purchasers in America.

Col. A. D. McRae's Views on Western Trade

Col. A. D. McRae, vice-president and managing-director of the Canadian Western Lumber Company, Fraser Mills, B.C., recently paid a visit of a couple of weeks duration to Toronto. In conversation with a representative of the Canada Lumberman, Col. McRae stated that the lumber business on the Pacific Coast continues on a very quiet basis. The majority of the mills have not been running on more than an eight-hour day basis, five days a week, since last August. Manufacturers on the coast are not looking for much in the way of business during the next ninety days, after which they expect that a fair business will develop. Stocks are low in the retail yards and immigration continues to keep up, all of which indicates that some business will have to develop after the new year. People at present are living in a manner which means curtailment in many regards. Everyone is economizing and this frame of mind generally takes a couple of years to pass away. It was curious, Col. McRae remarked, how these things worked out. A man would get it into his mind that he should economize and would commence to pay off his debts, rather than extend his operations or his purchases. This mood had become pretty general and had much to do with the present business situation.

In spite of these conditions the Canadian Western Lumber Company has done fairly well during the present year and the annual reports will show that all fixed charges have been paid and a reasonable surplus earned. Many of the larger plants on the lower mainland and Vancouver Island are closing down for an indefinite period on account of the quiet market conditions.

There are one or two features in connection with the lumbering industry and trade which, according to Col. McRae, give promise of better conditions. The shingle business, for instance, is improving. The Canadian Western Lumber Company is sending shingles in large quantities to the United States, and reports encouraging orders, all the way from Omaha to Boston.

The approaching opening of the Panama canal, according to Col. McRae, will be a very important factor in connection with the British Columbia lumber industry. Large quantities of southern pine are already consumed in Brazil, the West Indies and other southern markets. B. C. fir has already been entering these markets and will unquestionably obtain a much greater share of the trade when the canal is in operation. Recently the Canadian Western Lumber Company shipped no less than five million feet of fir to the Argentine upon one vessel. The company will also be making, during the month of December, a shipment of three million feet to South Africa.

Experience With a Cable Tram Road

By T. P. Jones, Potlatch Lumber Company, Bovill, Idaho.

There is nothing new under the sun. When you come to figure it out, all mechanical principles have been exploited. It is simply a question of applying old principles to certain definite conditions.

I will give very briefly the results which have been obtained by the Potlatch Lumber Company in the operation of an endless cable tramway which it has been my good, or bad, fortune—you can take it any way you like—to have had something to do with.

In the first place, the location of the cableway is not in a section of the country where a railroad could not have been built. The reason why the location was selected for an experiment, was by reason of availability and readiness to get in material. In the matter of experiments we made many—still at it—but we are making some headway. It was practically an uncharted sea we started out to sail upon. True, the cableway principle had been applied successfully in mining. But its application to logging was new in the United States as far as could be ascertained. Hence, the only thing to do was to try it out.

The holdings of the Potlatch Lumber Company cover a large area. The natural contour of the country is broken and precipitous. Elevations of 2000 feet are not uncommon. The timber will run on an average of 20,000 feet per acre. We log it clean down to 6-inch tops. It consists of Idaho white pine, Western white pine, larch, spruce, white fir, Douglas fir and cedar.

The snow is heavy, attaining depths of $3\frac{1}{2}$ to 15 feet. It commences to snow sometimes in November and lasts until May, in the hills.

The first experience of our company was to follow the old logging methods of Michigan, Minnesota and Wisconsin. We soon found, however, that the climatic conditions were different in many respects, especially in regard to the logging in snow. No freezing weather prior to the fall of snow; hence it had no sustaining resistance as in the East on account of lack of foundation. It would thaw out and a road that was all O.K. in the morning, the horses would break through the crust and practically compel a cessation of operations in a few hours.

This condition drove us to seek new methods. We were not accustomed to steam logging, except in the utilization of geared locomotives and steam loaders. This was the extent of our knowledge. A trip was taken to the Coast to learn all we could of the availability of steam, with a view to its adoption. In the selection of equipment we made some mistakes. First we selected engines with insufficient drum surface. We soon found out the limited amount of timber on the ground demanded an engine with a large cable carrying capacity, in order to save changing settings.

Our average yarding line was approximately 2000 feet to start with. Later this was increased to 5000 feet. In this connection let me say that we found 5000 feet haul impracticable, in the ordinary ground yarding practice, as carried forward on the Coast, where not over 1500 feet is considered maximum, with 800 feet and less being used in many cases. The evolution of the ground yarding system of 5000 feet, into the use of a sky line system for a rugged, rough country, was undertaken.

Birth of the Sky Line

Briefly, this system consisted of an ordinary two-drum donkey, to which a third drum was added, using the main drum for a standing line; the haulback drum utilized as a haulback; while the third was used as hauling-in drum. This line was supported on 9-inch poles at intervals, dependent upon conditions, from 500 to 2000 feet. On this

line was mounted a very simple two-wheeled carriage. From this carriage we run out a line about 100 feet on each side. Loads of 500 to 2000 feet were embraced in an ordinary choker, drawn up to the trolley through an 8 to 10-inch block on the carriage, and then hauled in with the pulling or main line drum. The lines were main or standing $1\frac{1}{8}$ to $1\frac{1}{4}$ -inch of ordinary hemp core line. The other lines were $\frac{5}{8}$ to $\frac{3}{4}$ -inch, of ordinary 6-19 strand.

The daily capacity of a rig of this type was a little better than that of the ordinary ground yarder on fairly level ground. We worked this system in very rough country, where it would have been practically impossible to operate a ground yarding system. Hence we felt rather encouraged with our experiment. But we soon found that to go back 3000 to 3500 feet or further we were losing too much time in carriage momentum. This caused us to look around for some other plan which would enable us to cover a larger area of country, where railroad building was prohibitive, and to avoid relaying or tandem yarding. This development was reached in 1911.

We believe if we could run a single line with a trolley carrying a single load of 2000 feet, that we should be able to operate a system carrying a series of loads, just as we had witnessed in ore, coal and other industries. The single trolley successfully negotiated the supports which held the line in position.

The system consists primarily of three lines—two stationary and one endless cable, the endless line forms a circuit around the two stationary lines. We used the same supports that we did on our sky line, and proceeded to install an endless line $1\frac{1}{2}$ mile long, in a straight line. We used the same lines as in the sky lines, viz: $1\frac{1}{8}$ -6-19 main, and $\frac{5}{8}$ return empty, and $\frac{5}{8}$ traction or power line. We then proceeded to build a number of trolleys, figuring on spacing our loads about 500 feet apart. The construction of these trolleys gave us considerable care. We finally worked out a trolley which is very simple and weighs about 30 pounds. It is made of cast steel, with a light 8-inch manganese wheel. The lower end of the trolley forms a hook, in which the power line lies and over which a D-shaped link is dropped to where a $\frac{3}{8}$ -inch choker chain, 14 feet long, is attached. The chain is then passed around the load and dropped in the toggle. The toggle link then locks the toggle. The chain acting as a wedge, has a tendency to stretch the link, thereby increasing the strain on the D link and insuring increased traction friction. A glance at the illustration herewith shown will clearly demonstrate this simple device.

Any ordinary 7 x 9, 2-drum type of engine will successfully furnish abundant power for a two-mile cable tramroad. Originally, two drums were utilized, but experience proved that the two drums were not a success, for the reason that the enormous strain on the shafts broke them repeatedly and caused general demoralization. We abandoned drum No. 2 and in place, cast a capstan in two pieces and bolted it to the main drum, leaving the original drum intact. Three turns are taken around the capstan, the line at the outer end running through three 10-inch blocks, two outer blocks acting as spreaders. The tail block has attached about 25 to 30 feet of cable, made fast to a convenient stump, thereby allowing for an adjustment of tension as circumstances demand.

We drop our main and traction lines down to four feet of the skids of the rollway. We assemble the logs under or beside the line, make up our loads, with two trolleys for each unit; give the go-ahead signal by ringing a telephone bell, and our load starts on its journey to the landing. Other loads are made up in succession at intervals on the line as desired. In this connection it may be well to state that we have built two tramways—the first of which was straight and continuous; the second one, the present line with curvatures. On our first line we spaced the loads about 500 feet apart. We are now spacing our loads about 150 feet apart. The time to make up a load at the rollway is

about one minute, the same time being ordinarily required to release at the other end.

After the first load reached the landing, and it was tripped, we signalled the loaders, and when the following loads reached the landing, the engine remained stationary until a signal from the rear was received. This plan worked successfully.

Five million was taken out over this line in 1912. This is the history of cable tramroad operation as far as the Potlatch Lumber Company is concerned.

Second Installation—Negotiating Curves

Encouraged with the success of our first venture, we decided to take a further step. The new location selection required a line of $1\frac{3}{4}$ miles. The contour of the country, as will be noted by the blue print, which gives a portion of the line, shows the curvatures encountered on the route. The sharpest curve negotiated is 43 degrees, which is made on three supports spaced 100 feet apart. No trouble has ever been encountered in transporting loads up to 80 feet. In front of these supports at the curves a 7-foot pipe roller hung to a guyed gin pole vertically, was installed to keep the position of the traction line sufficiently far from the carrying line between loads. Speed of traction line is about 250 feet per minute.

The curves could not be negotiated on the ordinary supports we had been using, which involved the use of a 12-inch wheel, as it had a tendency to cause the support to pull out horizontally, getting in the way of the trolleys. A "fish-hook" shaped support was designed with a groove for the cable to lie in and still permit the trolley to pass unobstructed. This plan works satisfactorily, and solved the curve problem.

A height of 25 to 30 feet is practicable for the operation of a cable-tram. In our case we had originally installed poles as high as 105 feet, for the reason we had not learned how to hold the cable in the supports without having the line uniform in height from the ground.

The above results were achieved with a continuous line, but we soon found by experience that it would be better to divide the line into two sections, on account of the heavy strain, incidental to transportation of 43 to 45 loads on the line simultaneously. This problem was solved by erecting two gin poles at 45 degrees incline, spaced 15 feet apart. The line from the rollway was received through two blocks and a box filled with rocks attached to the line to act as a tension anchor. The same plan was pursued for the line coming from the landing. A connection was made by using an "I" beam section and a piece of common 1 x 10 iron 15 feet long, to which a loose section was attached with a hinge, one end resting on the cable which conducted the trolley from the cable on to the track, and the other end, the operation was reversed, shifting the trolley from the connection to the line.

After operation for a time, it was found there was a marked tendency for the slack to collect from a back end of the cable to the station, allowing the counterweight to reach the ground. On the opposite side of the transfer the tendency was to carry the slack towards the engine and lift the counterweight. To overcome this condition we decided to make the line in four sections and abandon the weights. This was accomplished in the case of the 15-foot span by passing the line through the connection, fastening the end of the line to stumps.

In the second section, the gin poles are placed only about three feet apart, with a connection track about four feet long to transfer the trolley—which gives satisfactory results, and is cheaper to erect.

The capacity of a tramway as far as our experience shows, indicates that the ability to take care of the logs at the lower end, is the sole governing factor in its capacity. It would be safe to say that 500,000 feet could be transported in 10 hours. We are handling about 150,000 feet.

Additional rollway could be established for loading purposes. We are only using one terminal at either end of the tramway. Several landings could be utilized, as desired for the segregation of timber, or to give greater capacity to install additional loading facilities.

Cost of Construction

The cost of construction varies with the country, and the duties imposed. As to a fair average cost of a line similar to that of the Potlatch Lumber Company, under like conditions of country, after the right of way is cleared and material on the ground, such as hangers and supports, six men could erect gin poles and hangers for both return and carrying line a mile in length, in five days, employing the services of a team of horses. A fair estimate, including clearing right of way in the Panhandle of Idaho, would be, say, \$5,000 to \$6,000 per mile, exclusive of the engine. In this estimate the cost of building rollways is included. In our case we cleared a right of way so as to be sure when we took out the timber our operations would not be interfered with through trees falling on the line.

By constructing the line in units, it permits transporting the material as desired. Extensions are made by simply splicing the power line after standing lines are up, with supports spaced not over 400

to 500 feet apart. Greater spans are practicable if the contour of the country will permit.

This is an item which is very light; with good gin poles well guyed, the upkeep is practically nominal.

It is our judgment that a track strand type would probably give best service, due to the smoothness of the rope, greater strength, less stretching, due to the lack of manila core; and also due to the heavier wires used in its construction. The return carrier line requires fewer supports owing to the lessened load to be transported.

Two men are employed to release loads at the landing and replace the trolleys on the return line, and a man to grease the trolley every trip; the hauling crew consists of one engineer, a fireman and a wood buck. An engineer for the loading engine, which takes steam from the same boiler, constitutes the operating force of the tramway proper, while six men load and spot the cars as the grade is quite steep; and to insure safety, each man takes a brake when the cars are spotted. On the upper or loading end, five men are employed.

Two transfer stations are required on the return line, on account of the contour which causes the return line to drop down abruptly and rise again, which would have the tendency to make the line carrying back the empty trolleys, rise above our return line when we applied the brake, which would have a tendency to throw off the empty trolleys on account of the sudden jerks.

The braking is done by the engineer and consists of an ordinary friction brake.

If a gravity proposition were encountered, the brake should be located at the upper end. Our experience shows that we employed this system successfully by handling 4,000,000 feet on a gravity line, the loaded trolleys brought back the empties, a hand brake with a 16-foot lever giving ample power and controlling 12 to 15 loads at one time. The line was straight.

Place for Tramways

Tramways of this description are designed for special conditions and are not supposed to displace railroads where favorable conditions of operation are obtainable, but can be operated under conditions where railroads are not possible.

In order to overcome the necessity of the cable forming abrupt angles in a rough country, it is possible to design transfer connections, built on segments, and bolted together, thus insuring straight tangent for the cable.

It is safe to say that 500 to 2000 feet may be regarded as proper and safe distances for carrying the line between supports. Hanger spans would require large cable, according to load carried. The main carrying line is $1\frac{1}{8}$ inches, which has a breaking strain of 56 tons, with a working strain of 11.2 tons. A $1\frac{1}{4}$ -inch line has a breaking strain of 67 tons, and a working strain of 13.4 tons. A $1\frac{1}{2}$ -inch line has a breaking strain of 96 tons, with a working strain of 19.2 tons. These figures are submitted by the wire rope makers, and give an idea of the actual working strain which cables may sustain. For our new line we have purchased 12,000 feet $1\frac{1}{4}$ -inch track strand cable. We expect to erect this line in 2000-foot units. Sky line may be used in conjunction with the cable tramway, or ordinary ground yarder. In our case, we used horses for yarding purposes, on account of the experiment we were then making which we felt would not justify utilizing logging engines.

It is our intention to build an automatic lubricator to travel on the trolley, and thus insure perfect lubrication, which insures not only a marked reduction in friction load, but increases the life of the cable.

Adaptability to Heavy Timber

I believe it is entirely feasible to build tramways to transport logs up to any size. The requirements are heavy cables and supports to meet the demands placed upon them. I understand that a company in British Columbia, logging in heavy coast timber, is making preparations to install an 18-mile tramway.

It may seem rather amusing to state how certain difficulties were anticipated and overcome in the building of the cable tramway. Every logger like a sailor, has to devise some scheme to help him in a hard pinch, which is sure to come. The problem which required much thought was how to release a unit load of logs suspended in the air, perhaps eighty feet, and if by chance one end of the choker should come loose, leaving the load dangling in the air, the damage which would be wrought to the line, will at once appeal to every logger. But how were we to "turn the trick"? We had no airmen or aeroplanes as part of our logging outfit. We thought of every conceivable plan to overcome this difficulty, which must be solved. Finally it dawned on Billy Watts one night that he could shoot with a rifle the trigger or toggle link, which held the load. This was the solution of the difficulty. My trusty foreman, Bill Watts, is a crack shot, and you can see him every day pacing up and down the line, carrying his 30-30 rifle on his shoulder. In order to make a little better target we are welding a lug on the toggle link, which will not only provide a better mark for the "gunner," but will also make it simpler and easier to release with the use of a peavy at the landing.

That's Easy, Get A Linderman

This is what they all say who have tried it out

**DOMINION BOX AND PACKAGE COMPANY
LIMITED
MONTREAL, CANADA**

June 25th, 1913

Messrs Canadian Linderman Co., Ltd.,
Woodstock, Ontario

Gentlemen:—

Answering yours of June 23rd. regarding the matter of Economy in the use of your machines would say that it is pretty early yet to make any definite statement as to the ultimate saving by this process. The gross saving in our case amounts to about \$4.00 per day in labor and about \$4.00 or \$5.00 per day in lumber per machine, not to mention of course the very superior job which we secure and the fact that we can have solid stock of any size at any time. What our net saving would be considering the repairs necessary as against the groovers and squeezers heretofore used, we are of course not in a position to say at this time. If the 8' machine operates as continuously and satisfactorily as the 4' machine has done we are inclined to think that the repairs and replacements on the Linderman Machine would be about the same as upon the groovers and squeezers replaced by them.

We are sorry that we cannot give you more definite information, but you will realize that it is a little early to quote exact figures. In any case, however, we are well pleased with the process and the results and intend to make these figures safe or better them by eternal vigilance in the matter of maximum output and minimum repairs.

Very truly yours,

C. B. FULLER, JR.

Superintendent.

Canadian Linderman Co., Ltd.

Muskegon, Mich.

—Factories at—

Woodstock, Ont.

OPPORTUNITIES

WE own and offer for sale on attractive terms a few especially well selected tracts of timber running from 50 million to one billion feet that are ready for immediate operation, having a good local demand at high prices.

The timber on the Pacific Coast is the last stand of the the great forests. Well selected timber in British Columbia is the best investment on this Continent and offers especially attractive inducements for manufacturers.

EDGINGS

Ontario

The sawmill of the Rat Portage Lumber Company, Kenora, Ont., was closed down on November 8th, having had a very successful season's operations.

J. R. Booth, Ottawa, Ont., is erecting a mill, at a cost of \$20,000. The trestle for the conveying machinery has been completed and the other work is going ahead rapidly.

Davis & Doty, Oakville, Ont., are considering plans for the erection of a planing mill which will be 45 x 100 feet, of brick construction. The machinery will be operated by electricity and the company will require electric motors.

The L'Original Stave and Lumber Manufacturing Company, Limited, has been incorporated with a capital of \$145,000. The incorporators are T. Riufret, K.C., and A. R. W. Plimsoll, Montreal. The head office is at L'Original, Ont.

The mill on Picnic Island, Little Current, Ont., formerly operated by the Wolverine Cedar & Lumber Company, Sault Ste. Marie, Mich., and Little Current, Ont., is being offered for sale or lease after January 1st, 1914, by Thos. Conlon, 44 Church Street, St. Catharines, Ont. The mill has a capacity of 140,000 feet of one inch lumber in ten hours.

The Erie Basket Company, Limited, of Limington, Ontario, Canada, is seriously considering moving its heading, stave and basket plants from the Canadian town to Hickman, Ky. Representatives of the company recently visited Hickman for the purpose of making arrangements for a site, and it is understood that satisfactory terms were offered which will probably bring the company South.

Manley Chew, Midland, Ont., who experienced a serious loss recently on account of a boiler explosion in his mill at Dollartown, near Midland, reports that he is erecting a new boiler house 44 x 46 feet on a modern plan, and installing Dutch ovens. He expects to add another engine to the plant, thereby making an important increase in its output. Everything will be in shape for operation next spring, when Mr. Chew expects to have one of the finest mills on the Georgian Bay.

Mr. W. W. Carter, of the Fesserton Timber Company, Toronto, is suing the C. P. R. for losses sustained in serious bush fires in Matchedask township last summer. Mr. Carter alleges that the fires were caused by sparks from the defendant's locomotives, and resulted in the destruction of millions of feet of valuable timber. He seeks to recover \$356,250 as compensation for his losses. The details of his claim are as follows: 553,000 cords of bolts, \$275,500; 223,000 cords of wood, \$55,800; 1,200,000 feet of pine, \$12,000; 1,500,000 feet of hemlock, \$4,500; 3,150,000 feet of hemlock bark, tamarac, spruce and elm, \$7,450.

Tenders are being received by W. H. Hearst, Minister of Lands, Forests & Mines, for the province of Ontario, until December 31st, for the right to cut pulpwood on a certain area on the Metagami River in the district of Nipissing. Tenderers will have to state the amount of bonus they are prepared to pay in addition to Crown dues of 50c per cord for spruce and 20c per cord for pulpwoods. Tenderers will be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the province of Ontario. A cheque for ten per cent. of the amount of the tender must be sent in with the tender.

J. R. Booth, Ottawa, Ont., will add to his paper plant with a view to increasing its output. Work has been commenced on a new mill designed as an addition to the present sulphite plant. It will be built of concrete and will house two Manitowoc digesters. It will have when completed a capacity of 50 tons of sulphite pulp per day. The present capacity of the sulphite mill is 70 tons which will make the total output 120 tons per day. The Booth plant now turns out 150 tons of mechanical pulp daily, so that the production of pulp of both kinds will total nearly 300 tons per diem. The new building is being constructed by the firm itself. This is the rule with all new construction at the Booth plant. They use their own plans and employ their own engineers and workmen.

The Schroeder Mills & Timber Company, a Wisconsin Corporation, closely allied to the John Schroeder Lumber Company, Milwaukee, Wis., are the owners of timber licenses covering the north half of Brown Township, practically all of Wilson Township excepting a few located or sold lots, and nearly all of the north half of Ferry Township, all in the district of Parry Sound. The licenses stand in the name of Frederick H. Schroeder. During the present winter The Schroeder Mills & Timber Company will confine their operations to Brown & Wilson Townships and expect to put in about 10,000,000 feet of logs. The operations are in charge of Mr. James Ludgate of Parry Sound. About three-fourths of the cut will be driven to Byng Inlet by way of the Still River and the balance through Farm Creek and the Magnetawan River to the same place, where the logs will be sold. The company do not intend to manufacture any lumber this season. Improvements on Farm Creek and Still River are practically completed. Five camps are now being operated and over 3,000,000 feet of logs have already been made and skidded. The cut this season will be practically all of white pine. Mr. W. J. Merkel, who recently visited the company's operations, reports that splendid progress is being made and that a fine lot of logs are being produced.

Eastern Canada

The sash and door factory owned by Mr. A. Bourque, at St. Cyrille de Wendover, P.Q., has been totally destroyed by fire. The loss of \$15,000 is only partially covered by insurance.

The Dominion Ironbound Box factory, owned by William Rutherford & Sons Company, Montreal, has been damaged by fire, which originated in the rear of the paint shop under the lumber storeroom and shavings conductor of the firm's sawmill and sash and door factory.

N. M. Jones, general manager of the Edward Partington Pulp and Paper Company, St. John, N.B., in reference to the reports that have been published that the company would greatly increase their output, says that they do not

intend making any further extensions to their plant at the present time beyond necessary repairs and that the market is apparently well supplied with all the pulp and paper that it can absorb just now. When asked what effect the new United States tariff would have on the pulp and paper situation generally, Mr. Jones said that the new order of things had not been in operation long enough for him to give an opinion as to the outcome on prices and that overproduction was affecting the market more than the tariff at the present time.

Western Canada

The Lee Lumber Company, Wigwam, B.C., recently suffered loss by fire, to the extent of \$30,000.

A Vancouver syndicate is organizing to take over the sawmill at Port Hammond, on the Fraser River.

H. Ellison, of Vancouver, who has secured a contract for ties from the C. P. R., will install a portable mill near Port Moody.

The Powell River Pulp & Paper Company has secured 30,000,000 feet of logs from the Ocean Falls Company, which recently closed down. These logs are being shipped down the coast in the form of large rafts, cigar shaped.

With the right to manufacture and deal in sash, doors, moldings, casings and finished lumber products, the Bridgeport Lumber Company, Limited, has been incorporated at Vancouver, B.C., with capital stock of \$250,000.

J. W. Hyde, of Jacksonville, Florida, and H. G. Clarke, of Pittsburgh, Pa., timber brokers, who have several branch offices in the United States, were in Vancouver recently. They will open offices both at Vancouver and Seattle.

The Fort Qu'Appelle, (Sask., Can.) Boat Building and Wood Manufacturing Company expects to erect a \$42,000 planing mill. The building will include woodworking shop, boat-building shop, planing mill, and will be largely of brick and concrete construction.

As the result of an accident at the Barnet Saw Mills, Barnet, B.C., the base of the band mill gave away recently while the mill was in operation. Fortunately no one was injured. The mill building was badly cracked, and will not be in operation again for some time.

The Day Logging Company has been billed by the B. C. Government for timber alleged to have been cut on Crown lands without the necessary authorization. They will be asked to pay for 100,000 feet at the rate of \$10 per tree, for what was cut, wittingly or unwittingly, on government property.

The Prince Albert Lumber Company recently closed their mill for the winter and most of their employees have gone to the woods. It is expected that the company's operations in the whole this year will be on about the same scale as last year, giving employment to between 1200 and 1500 men.

Fire broke out recently at No. 8 mine of the Canadian Collieries (Dunsmuir) Limited, at Cumberland, Vancouver Island, and completely gutted the company's sawmill and destroyed 2,000,000 feet of dried lumber. The damage has been estimated at \$100,000. The origin of the fire was not determined this morning. The lumber burned was intended by the company to be used for the construction of more than one hundred houses which the company had begun to erect for the accommodation of its employees at the No. 8 mine. The mill was equipped with expensive machinery which was completely ruined. The company is expected to rebuild the mill at once.

The Big River Lumber Company, Big River, Sask., report that they are now erecting a new mill on the site of the one which was destroyed by fire on June 11th. The new mill will have practically the same capacity as the old mill. They expect to have the plant completed in the near future, but, as sawing operations are not carried on in the winter, the mill will not be running until spring, with the exception of the planer, which, it is expected, will be operating shortly after the new year. The company also state that they never had any idea of building a number of small mills throughout their berths, as was formerly reported. The former mill, which was destroyed by fire, was one of the finest in Canada, employing 550 men and containing three band mills, one horizontal band re-saw, and vertical band re-saw, and an additional re-saw for slabs; four gang edgers, trimmers, etc.

Mr. C. C. Yount, vice-president and general manager of the Empire Lumber Company, recently visited Victoria, B.C., and stated that early next spring the company proposed to construct a new mill at Osborne Bay near Crofton, B.C. The mill will be equal in dimensions and capacity to any on the Pacific Coast. Both Mr. Yount and Mr. W. E. Marsh, president of the Empire Lumber Company, are enthusiastic about the lumber manufacturing industry on Vancouver Island and express the opinion that in spite of the present dull trade conditions, a splendid era of prosperity lies ahead. The company had intended to commence their operations earlier, but this plan was interfered with by the weakening of the financial situation. In an interview Mr. Yount said:—"I have just been to New York, looking over the financial situation and enlisting capital. I am pleased to say that everything has been arranged satisfactorily." Once the winter is over we shall be in a position to commence operations in earnest.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

1724. **Poplar box boards.**—A London firm who handle large quantities of poplar box boards suitable for tea chests and butter boxes, invite offers from Canadian manufacturers interested.

1729. **Birch planks.**—A London firm wishes to contract for supplies of prime birch planks, and invites c.i.f. quotations from Canadian manufacturers.

1730. **Clear pine and oak.**—A London firm wishes to obtain prices from Canadian firms in a position to ship clear pine and oak to New Zealand.

Wanted Lumber

WE are in the market and pay cash for 1" Cull Birch, 1" Cull Elm, 1" Cull Maple, and No. 2 Hemlock, for stock both in shipping condition and to be sawn. Correspondence with mills solicited for above mentioned stock and for any other lumber, lath or posts you may have to offer.

There is Big Money Cutting Cordwood

The Features of Kent's Cordwood Splitter

- 1 Conveyors of logs to saw.
- 2 Steam hold down.
- 3 Cut-off saw.
- 4 Conveyor from saw to splitter.
- 5 } Steam piston.
- 6 }
- 7 Steam head block.
- 8 Can be used as friction drive to carry wood out.
- 9 Vertical splitter.
- 10 Adjustable horizontal splitter.
- 11 Delivery table.

The new Kent Cordwood Splitter will turn small and rough timber, from which all logs suitable for lumber have been taken, into valuable cordwood. It will add millions of dollars to Canada's cut-over limits.

If you own or hold permits for any hardwood timber limits the Kent Cordwood Splitter can make big money for you. The machine is economical to operate and cheap to install.

The capacity of this invention has been demonstrated as 42 cords of 4 ft. cordwood per day of 10 hours with 11 men and one team. That means the timber cut, split and piled.

The cost of splitting hardwood has been reduced over 50 per cent. by this invention aside from the utilizing of timber that would be useless for any other purpose.

*This is an unusually interesting proposition—
we solicit your enquiries.*

The Correct Belt for Every Kind of Drive

Use Scandinavia

- On your main drives and on all direct drives whether straight or crossed.
- On wet drives, provided belting stays wet.
- In places where it is hot.

Scandinavia has good surface for clinging to the pulley, runs true, is flexible and enormously strong.

"Circumstances alter cases" when choosing the right belt to get longest and best service. Write us about your belting problems. We can save you money. Send to-day for copy of THE MAIN DRIVE.

Use Lanco Balata

- Where the conditions are constantly changing from wet to dry.
- Where belt must run under extremely cold conditions.
- Where you want an endless belt.

Lanco Balata will stand up under high speeds. It is impregnated with pure balata gum ensuring the highest service giving quality.

Toronto

Federal Engineering Company, Limited

Montreal

A Good Belt Saves Money

THE money wasted in keeping a stretching belt taut amounts to a surprising figure. If you use "Goodhue Belts" in your mill or factory you can save most of this money because "Goodhue Belts" stretch less by 15 to 25 per cent. than any other belt. They are made from skillfully selected hides with the stretch taken out of each section before it is made up into the belt.

According to the conditions under which the belt is to run, we recommend "Extra," "Standard" or "Acme Waterproof" belts.

Send for further particulars and prices.

GOODHUE BELTS

DANVILLE — QUEBEC.

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

Results from logs of given dimensions cut on Breeze, Denison & Co. pat. band mill.

Diam.	Log Length	Feet Lum.
8 in.	16 ft.	45
10	12	54
10	16	69
11	15	96
14	16	171

by using our
**Patent Steel Band
Mill and Carriage**

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth:—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

WHY you should install the Mahony Blower System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses $\frac{1}{2}$ less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

PEAVIES

Cant Hooks, Boom Chains, Timber Dogs

It is time to think about your logging equipment for the ensuing season. Let us figure on your requirements for Peavies, Cant Hooks, Timber Dogs, Boom Chains, and Shackles, Mill Chains, Forged Steel, Log Stamping, Hammers, etc.

Our products are the result of over 50 years of careful study of the lumberman's requirements and we can offer the best equipment at the lowest price.

Write us for particulars and prices

ARGALL BROTHERS Three Rivers, Quebec

Every Hour Saved

By the Use of The Shimer Limited Cutter Heads

Adds to the capacity of your mill. These heads are built especially for the High Speed Matcher and will tongue and groove flooring at 150 to 170 lineal feet or more per minute.

They are self-centered on the spindles by means of a chucking device which grips firmly thereto when drawn up, insuring all the cutters doing their share of the work and removing the objectionable set screw which has hitherto been used for fastening purposes.

The Bits carry a larger areal surface and the Bit chambers are of greater depth to compensate for the new acute angle given to the Bits for greater relief to the parts coming into contact with the lumber.

Price, net, in solid section, complete for making flooring \$67.00. With Expansion feature like illustrations \$72.46.

Griplock Riveted Chain Belt

Section of Griplock Riveted

No More Breakdowns—No More Delays

This is the slogan that users of **Griplock** Chain Belt have adopted. No hooks to be opened up, no breaking of chain belt in **Griplock**. **Griplock** is so constructed that it will withstand the severest kind of service. It is built by the Chain Belt Company, Milwaukee, Wis.; a concern that fully understands the requirements of the Lumber and Saw Mill Trade.

We would be very glad to mail you sample links for your inspection.

Sold by **The A. M. ELLICOTT CO., Montreal, Que.**

Elevating, Conveying and Transmission of all kinds a specialty

Have you investigated this wonderful cost reducer ?

A ^{FAY-EGAN} "LIGHTNING" 333-335 Matcher Resaw Outfit lowers manufacturing cost by eliminating handling, increasing output and raising grades.

Because of keen competition, you lumbermen are studying methods of lowering manufacturing costs. You must give your customers good lumber and still make your profit.

Manufacturing costs can be lowered in two ways—by eliminating handling and by doing away with degrading loss due to manufacturing defects.

To illustrate the first, investigate the Fay-Egan 333-335 Matcher-Resaw **with Resaw below the bed-line of Matcher.**

By your old methods, you make bevel siding, shiplap, ceiling, etc., double thick on a Matcher at about 75 ft. a minute, then you truck to a Resaw and feed at about the same rate. This requires two feeders and two off-bearers and a whole lot of your stock is torn out, fuzzy, uneven and otherwise lowered in grade.

With a 333-335 you match double thick and resaw in one operation, requiring only one feeder and one off-bearer—instead of 75 ft. you get 200 ft. a minute and every bit of your stock grades up No. 1.

This means a reduction of at least 50% in manufacturing costs and an increase of from 10 to 30% in market value of your product.

You may be making pattern work—then you should investigate the 333-288 Matcher-Profiler.

Or if you are getting out flooring or plain four side matching, look into the regular 333 Matcher.

A "333" installation is made up of units which can be coupled together to meet your individual requirements.

Let us study the proposition with you and for you.

As a starter along this line, read our book on Fast Feed Matchers, Surfacers and Appliances. A copy will be sent free upon request if you use your own or company letter head. Ask for Book No. 87.

No Mountain Pass too Steep for
the Horse shod with

Red Tip Calks

Nowhere are surefooted horses more necessary than in the dangerous mountain passes and steep slippery hills encountered daily by the lumberman.

Red Tip Horseshoe Calks

here prove their value, and their cost is but a slight premium to pay as Horse Insurance.

The horse shod with Red Tip Calked Shoes is fearless and capable and can do the work required of him without danger to life or limb.

**We'll Stand
the Cost of
J-M Permanite
Sheet Packing
if it Doesn't
"Make Good"**

We have so much faith in J-M Permanite Packing that we are willing to accept your order and let you test it entirely at our risk.

We put it up to the Packing. And you are to be the judge as to whether or not it makes good.

Try it on the most troublesome joints in your whole plant—joints which heretofore, with other packings, have needed constant attention.

If J-M Permanite Packing doesn't put an end to the troubles these joints have been giving—if it doesn't make them permanently leak-proof—if it doesn't eliminate the need for following-up—then return what you have left and we'll refund the full amount of our bill. The trial won't cost you a cent.

Surely it's well worth your while to find out whether J-M Permanite Packing will put an end to those leaky joints and all the vexations and delays they cause.

Send our nearest Branch your order now with the above understanding, stating the conditions you have to overcome and the thickness of Packing desired. We're making you a straightforward offer on which you have nothing to lose. We take all the risk.

The Saw is Bigger Than the Mill

No matter how well-equipped the mill—however modern its appliances—the results will not be entirely satisfactory without a perfect saw equipment. Just as the strength of a chain is judged by its weakest link, so is the quantity of the output, the quality of the lumber and the upkeep expense dependent upon the saws installed.

DISSTON SAWS

are increasing the output and general efficiency in a majority of the world's lumber mills. Our records contain large numbers of voluntary testimonials from millmen everywhere who have learned that the best results are achieved by those who "Depend on Disston."

This belt pulls 100 h.p. Note the 17-inch slack, and then note the tightener used before applying Cling-Surface.

We have already called attention to many installations where Cling-Surface has made belts do more and better work.

Here is another: When photographed this engine in the plant of J. S. Hagerty Brick Co., Detroit, Mich., was delivering 100 h.p. from a 6-ft. to a 3-ft. pulley through a 20-in. three-ply leather belt, engine speed 75 r.p.m. Center to center of pulleys 20 ft.

Since April, 1903, this belt has had good consistent Cling-Surface treatment and has given no trouble. As shown, it runs with 17 in. slack, and without slip.

Mr. Henry Malesky, the plant superintendent, says about this belt: "You will notice that the heavy tightener necessary before Cling-Surface was used is now hanging in the air, clear of the belt. It is no longer needed."

This belt like all Cling-Surface-treated belts, is giving excellent service. It is just one of hundreds of instances where Cling-Surface is saving many dollars each year simply because it relieves the belts of unnecessary initial tension and entirely eliminates slip.

Tell us your conditions and we will tell you what improvement is possible with Cling-Surface. Write for literature and ask for quotations which are f.o.b. Toronto.

Catalogues furnished and prices quoted on application

The Steam Tension Band Mill

THE top guide on this mill, as well as the upper wheel, is operated by a steam cylinder.

This means that the guide can be moved up or down instantaneously, which in one day's work means quite a saving of time over the ordinary mill. This goes a long way towards paying for the mill by the end of a year.

But this is not all—with this steam operated guide it is just as easy to keep the guide close to the cut as it is to set it for certain size logs and keep it

there. This can be done without loss of time, and so by bringing the guide down close to the cut, vibration of the saw is done away with and the quality of the lumber is improved.

No form of tension yet devised is as easy on the saws as the steam tension—several of the users of this mill have run through an entire season without cracking a single saw.

These are some of the reasons why our steam tension band mill is the most economical mill to buy, and there are others which you will find in our catalogue.

When you are tuning up your mill this winter for next season's operations, remember that we can serve you promptly whatever your requirements may be.

Keep a Weather Eye on Timber

That calm which many times has preceded

A Storm of Timber Buying

Today envelopes the timber market.

We can afford to wait, as we have waited many times in the past, for this change.

Can you?

Anticipate next year's bulge in prices by buying now. Those who have acted on that advice never have had reason to regret the action.

Current conditions favor the buyer; soon they may change to conditions which favor the seller. Let the logic of today guide you.

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works

Philadelphia, Pa., U. S. A.

For Logging Operations

OUR Logging and Industrial locomotives are not mere engines from stock, but specially designed locomotives for logging use. They operate with a minimum of fuel consumption and can be relied upon to give steady service every day of the year. All parts are amply designed, lessening the possibility of breakage.

Send for specifications.

Canadian Locomotive Company, Limited, Kingston

"Superior" Lath Machine

THE sturdy little lath mill has a capacity of 72,000 laths per day. It is well built and quite moderate in price. This "Superior" machine is guaranteed to run coolly being equipped with our special design ring-oiling-boxes.

"Dunbar" Clapboard Machine

Here is a machine that will make clapboards out of lumber that cannot be profitably manufactured into anything else. It is guaranteed to take from 15% to 20% more out of the same lumber than the old style machine. Capacity from 5000 to 7000 per day according to quality of lumber.

It will pay you to get our particulars

Maritime Foundry & Machine Wks.
Limited

Chatham,

New Brunswick

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gears. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

Tudhope - Anderson Co., Limited
ORILLIA, ONT.

**Not altogether what we
say but what users say**

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs,
in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

Knight

Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk 3 feet by 6 feet 3 inches
Diameter and Length Mandrel . 2 3/16 by 55 inches
Size Drive Pulley 20 by 10 inches
Feed per Revolution of Saw 0 to 3 1/4 inches
Feed Belt 4-inch Gandy
Largest Diameter Saw 56 inches
Length of Carriages 12, 16, 20 or 24 feet

Width of Carriages 33 inches
Trucks 7-inch wheels and 1 1/4-inch axles
Length Track 32, 40, 48 or 56 feet
Style and Opening of Blocks C1-36 inches
Style Mill Dogs Pony Excelsior
Style Set Works No. 1 Single Ratchet

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

- SPARTAN -

The Unconquerable

Fill out this Coupon and mail today. Booklet will be sent free.

The Saw Mill—the Planing Mill—in fact every woodworking plant constantly demands a maximum of power.

It is in these plants that the highest degree of power efficiency was not attainable until **Spartan** "The Unconquerable" was introduced.

The modern machines and those **Spartan** equipped guarantee you a plant continually operating at maximum efficiency.

Spartan Belting embodies great pliability, wonderful tensile strength and extraordinary durability.

To this unique combination **Spartan Belting** owes its present universal popularity—a combination which renders **Spartan** especially adapted to the exacting demands of planers, matchers and other woodworking machinery.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |

POWER PLANT

- | |
|--|
| 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy, double arm split fly wheel. |
| 2 Double Duplex, high pressure Water Pumps. |
| 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| 2 125 h.p. Water Wheels. |
| 1 Upright Engine for sawdust conveyor. |
| 1 10 h.p. Engine. |
| 1 Mitts & Merrell Hog. |
| 1 Wood Machine for 22-in. wood. |
| 1 Wood Machine for 18-in. wood. |
| 1 Edger for ripping dry lumber, installed. |
| 1 Edger for ripping dry lumber, not installed. |
| 1 30 h.p. Generator, 250 volt. |
| 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- | |
|--|
| 1 Automatic Filing Machine for 12-in. D.C. band saws. |
| 1 Automatic Grinding Machine for 8-in. S.C. band saws. |

The Truck That Saves It's Cost Several Times Over in The Year

This truck is designed for lumber yards and planing mills and will be found invaluable for loading and unloading cars.

The front gearing is detachable and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue which describes these trucks in detail, and pick out the style you want now.

PEAVIES

Cant Hooks, Boom Chains, Timber Dogs

It is time to think about your logging equipment for the ensuing season. Let us figure on your requirements for Peavies, Cant Hooks, Timber Dogs, Boom Chains, and Shackles, Mill Chains, Forged Steel, Log Stamping, Hammers, etc.

Our products are the result of over 50 years of careful study of the lumberman's requirements and we can offer the best equipment at the lowest price.

To Save Wisely You Must Buy Well

Therefore, it behooves every woodworker to make a thorough investigation of **"DEFIANCE" Woodworking Machines**

We would particularly call your attention to our new

No. 0 HAND FEED THREAD CUTTING MACHINE

As illustrated herewith. It is especially designed for cutting threads on wooden articles such as duster, scrub and other types of brush handles, also carpet sweeper handles, spool barrels, insulator pins, etc. It will cut any number of threads per inch three inches long and shorter, accommodating handles from the shortest lengths up to 48 inches long. An ingenious device is furnished for threading crooked handles along with the straight ones without change of adjustment; also threading straight or tapered end handles.

May we not quote you price for immediate delivery?

The Steam Tension Band Mill

THE top guide on this mill, as well as the upper wheel, is operated by a steam cylinder.

This means that the guide can be moved up or down instantaneously, which in one day's work means quite a saving of time over the ordinary mill. This goes a long way towards paying for the mill by the end of a year.

But this is not all—with this steam operated guide it is just as easy to keep the guide close to the cut as it is to set it for certain size logs and keep it

there. This can be done without loss of time, and so by bringing the guide down close to the cut, vibration of the saw is done away with and the quality of the lumber is improved.

No form of tension yet devised is as easy on the saws as the steam tension—several of the users of this mill have run through an entire season without cracking a single saw.

These are some of the reasons why our steam tension band mill is the most economical mill to buy, and there are others which you will find in our catalogue.

When you are tuning up your mill this winter for next season's operations, remember that we can serve you promptly whatever your requirements may be.

The Meaning of Transmission Efficiency In the Mill

"Transmission Efficiency" means the smooth and uninterrupted working of every belt in your mill—no slipping and consequent loss of power—no shut-downs—no stops or delays for adjustment and repairs.

Would you have "Transmission Efficiency" in your mill? Then equip your plant with

NEPTUNE Waterproof Leather - Belting

The belting which will give you the **highest efficiency in power transmission** throughout your entire plant.

In places where the ordinary kind of belting goes all to pieces, "**Neptune**" belting runs right along day after day, every joint and every lap as tight and secure as when first installed.

"**Neptune**" is the pioneer of all waterproof belting—it has steadily grown in favor with planing and lumber mills, because of its wonderful durability and waterproof features. Its large sale throughout the Canadian provinces is strong proof of its genuine value—it has the unqualified endorsement of thousands of users.

Remember, **Neptune Leather Belting** is guaranteed to be absolutely waterproof, that the laps will not loosen if wholly submerged in water, and, if double belting should be used, that it will not come apart in the laps or between the plies.

Let us send you further particulars with prices and samples of the **Neptune Brand** also a copy of our **24-page Neptune Book**.

The Graton & Knight Mfg. Co.

Oak Leather Tanners and Belt Makers

Worcester, Mass.

NOTE:—In saw and planing mills where the transmission conditions are extremely exacting use SPARTAN LEATHER BELTING.

When the gang draws pay for loafing

THE Millman who is studying for efficiency must see the waste in using Belts that go wrong—tying up the whole outfit. He must see the waste of precious time—which is money. He must also see the loss entailed by a gang being thrown off work, but not off the pay roll.

A cheap belt piles up a bill of expense that may seem purely incidental—but which is directly attributable to poor belting.

A belt runs slack and must be fixed—stopping an expensive machine, wasting the men's time which runs quickly into money—often falling down on deliveries and losing business.

A Goodyear Belt will not run slack—Because it will not *stretch*.

In the making of Goodyear belting, the many plies of hard-fibre cotton duck—each thoroughly permeated with rubber “friction”—are compressed into a solid combination of strength and grip.

The Goodyear “curing” or vulcanizing is done while the Belt is stretched to its utmost limit by special machinery. All tendency to stretch in service is taken away. That is why Goodyear Belts do not *stretch* in service.

The toughness of carefully-tested cotton fibre, inseparably united under tremendous pressure with high-grade rubber friction, makes a pliable Belt of great strength.

GOODYEAR BELTS

Goodyear Belts grip the pulleys. They convey **ALL** the power because they do not slip. The outer surface of rubber holds tenaciously to the pulley. The belt is pliable under any weather conditions.

This rubber covering protects the inner fabric of the Belt from rain, oil, etc., which would cause rot and decay.

Neither heat nor cold, rain or shine, can affect the pliability and effectiveness of our Rubber Belts. They remain soft under the hardest service. Repeat orders from millmen, and big increases in sales, prove that they are satisfying the demands of experienced men.

Do You Know that the Hanchett Swage and the Hanchett Shaper

will cut down your saw cost and increase the efficiency of your saw mill equipment? They will make your band, gang and circular saws cut more and better lumber daily with less effort and worry on the part of your saw filer.

THATS THE REASON they are universally adopted and are conceded by the vast majority of practical and up-to-date saw fitters to be the greatest swage and shaper ever placed on the market.

If you are not already acquainted with the superior features of these tools, we shall be pleased to place this pair with you on 30 days trial where you can see the work they will do on your saws in your filing room. If they are not the best Swage and Shaper you have ever used, you may return them to us at our expense.

Write for our No. 4-F Catalog which is fully descriptive of our most complete line of up-to-date saw fitting and knife grinding machinery.

 Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 33

Toronto, December 15, 1913

No. 24

Workmen's Compensation Act

Public attention has been called to some extent of late to the proposed workmen's compensation act for the Province of Ontario, presented by Sir William Ralph Meredith, in his final report as a Commissioner appointed by the province for the purpose of examining into the matter and reporting upon it. The question has been before the Legislature for nearly three years. The Commissioner has presented earlier reports, the proposals of which have been considerably amended by those which followed. The present report being "final," it may be concluded that the Government will consider the advisability of introducing a bill based upon the draft bill submitted in the report. Under these circumstances the situation becomes one of most urgent importance, and it is necessary that the views of those interested should be crystalized and presented to the government as forcibly as possible, so that the act, if it be passed, may be not only theoretically just and commendable, but at the same time practical. Most of the articles which have been printed in the daily press, referring in an incomplete and frequently incorrect manner to Sir William Ralph Meredith's report, have consisted largely of a summary of the draft bill and a synopsis of the remarks made by the commissioner in the report. Little has, as yet, been published in the way of an analysis of the actual results to be expected from the enactment of the proposed bill into law.

While it would be impossible, in the limits of a trade journal article, to give anything in the nature of a complete analysis of so intricate and important a question, there are some outstanding features which may be dealt with in such a manner as to give an idea of the proposed bill as a whole, when considered in regard to its commendability. In such an analysis it should be continually borne in mind that the manufacturing interests of Canada, as represented by the Canadian Manufacturers' Association, have shown themselves

ready to encourage the enactment of a measure of workmen's compensation which will fulfil the just requirements of the case. They have given the time and study of experts to the development of the proposals upon which such a measure should be based, and they have relieved themselves of any suspicion of seeking to escape from proper responsibility in connection with the situation. In justice to them, after the assistance which they have already given, the representations of the manufacturers should now be given unbiased and complete consideration. The manufacturers recognize the justice of workmen's compensation. They recognize the benefits which will accrue from the adoption of a system that will reduce the amount of litigation necessary to render justice to injured workmen, and they have been seeking for nearly three years to assist the Government in planning a scheme which will be practical and fair. From the point of view of the manufacturers, some of the chief criticisms resulting from an analysis of the proposed bill may be summed up as follows:—

The scale of benefits is absurdly and unreasonably high. In Manitoba, British Columbia and Nova Scotia the maximum amount of compensation is \$1,500. In Alberta it is \$1,800, in Saskatchewan and Quebec it is \$2,000. The maximum payment under the draft bill for Ontario would be a pension of \$1,100 a year for life.

The bill consists of a collection of three distinctly conflicting principles, viz.:—(1) State insurance under a government commission, applied to certain groups of industries each of which contribute to a joint insurance fund; (2) Individual liability with adjustment of claims by a government commission; (3) Individual liability administered by the courts of law.

The difficulties developing out of the embodiment of these three conflicting principles in one measure, may be illustrated by consideration of the indefiniteness of the boundaries between the different classes of employers covered by the bill. In the first place, it would be almost impossible in many instances to decide, without extensive reference to the courts, under which class a given manufacturer came, and in the great number of cases in which an employer carries on several different kinds of business, there would be room for further litigation in regard to determining how the assessment upon him should be paid. These difficulties are brought about by the indefinitely large and vague definitions furnished in the preliminary section of the proposed bill. Take for instance the definition of the word "manufacturer," which is to include any one who is engaged in "making, preparing, altering, repairing, ornamenting, printing, finishing, packing, assembling the parts of and adapting for use or sale any article or commodity." It would puzzle a lawyer to find anybody who could not be brought under such a definition. It would be possible to include a great number of employers who are also included in one of the other sections of the bill, and yet the principles upon which compensation is to be awarded vary, as outlined above, according to the section of the bill under which an individual employer is to come. The indefiniteness of the boundaries between the classes of employers is in fact one of the features of the proposed bill which is most open to criticism.

Another feature of the bill is that it attempts to put into immediate effect a far-reaching system which might more profitably be built up by degrees. It is difficult to imagine how the government, even

A MERRY CHRISTMAS AND A HAPPY NEW YEAR

It is an old wish, but it always rings true, and, unlike many other greetings, there is no uncertainty about its note of friendship. Lumbermen get as close to the real spirit of Christmas as any other class of men—closer than most—and they know well what the Christmas greeting means. The pleasantest Christmas that any lumberman ever had is no better than the one which the Canada Lumberman & Woodworker hopes they will all have this year, and after that a Happy New Year, commencing on January 1st and lasting all through 1914.

with an army of officials, could collect the contributions provided for, from the vast number of small employers coming under the various headings of the bill. Unless the premiums were collected from every employer, it is reasonable to assume that those who did pay would make up the deficiency for those who did not.

In connection with some of the classes provided for by the bill, the ordinary common law defences of employers are taken away, viz., contributory negligence, negligence of a fellow employee and the risk assumed by the workmen in connection with certain employments.

These are only a few of a number of forcible criticisms which

may be directed against the proposed bill. It is to be hoped that manufacturers of all classes will get together and take immediate steps to have their interests strongly presented to the government as soon as possible, with a view to amending the bill before it becomes law, or introducing an entirely new measure.

The whole situation, as roughly outlined above points forcibly to the mistake of having appointed a commission consisting of one man, however eminent, and he a member of the legal profession, instead of a commission, possibly of three men, including, at least two practical business men and possibly one lawyer.

Reduction of Waste in Manufacturing

British Columbia lumbermen who read the articles now being published in a series in the Canada Lumberman, under the pen name of "Douglas Fir," have probably come already to the conclusion that the writer is a man of long experience and that his views are not only interesting, but of much importance to all engaged in the production of lumber in that province. In the first two articles he dealt with matters relating to sacrifice of profits, devoting attention particularly to price cutting and similar evil trade practices, also discussing the general situation in connection with conservation—conservation in its most practical sense, the profitable use of the timber resources of the province, so as to get out of them everything that is of value. In the present issue the same writer follows out this conservation idea a little further and applies it in a practical manner to operations in the woods and at the mills, taking as an example a single instance of a large tree and showing how its value may be reduced or enhanced in the logging operations and also in the sawing operations. The commendable feature of these articles is that they are written in a spirit of the utmost good fellowship. They do not attack without suggesting methods of improvement, and they admit that few if any, even the reader included, are in a position to criticize unless they can suggest remedies. In fact the situation is one which calls for a general admission of the importance of the demand for scientific study of all the operations connected with the lumber producing industry, and a similar study of all the practices connected with marketing the product. The helpful feature of the situation is the fact that the operations of to-day show great improvement in many respects when compared with those of only a few years ago. The most discouraging feature is the fact that, in spite of all the efforts of the better-minded owners of the industry, selling methods do not show that improvement which might have been hoped for or expected.

Leaving the selling situation out of the question for the time being, the article which appears in this issue is one which will repay close study. It does not deal with any involved problems of opera-

tion. The average logger or manufacturer will probably feel that he knew everything contained in the article before he read it. The writer does not seek to infer that this is not the case. What he is trying to do is to put the matter so simply before those who are intimately concerned that they will feel inclined to give it more attention now than they have been accustomed to in the past, and to reduce the amount of waste in their operations. The writer points out how, in the sawing operations it would have been possible to save a lot of money—as much as \$6,000 or \$8,000 in one month's operations in a mill cutting 200,000 feet per day. In connection with the same class of logs, the logger might make a saving of \$1,900 per month, on an operation putting in about 50,000 feet per day. These are great savings and will make much of the difference between success and failure. They call for more than a simple statement of the saving that can be made on an individual log, and we hope that the writer will contribute further articles discussing the best manner of revising woods and sawing operations to make sure that this saving will be made a matter of policy, rather than one of chance.

The really difficult question is how to make sure that the man in the bush will cut each log into the most valuable size according to the conditions of the market at the time. The next problem, one of practically the same importance is how to make the most valuable class of lumber out of its logs—having of course a similar regard to the demands of the market at the present time. This latter problem is indeed a very difficult one. It involves, on the part of the mill manager, a most minute knowledge of market conditions and available sources of log supply. One can only hope to bring every logging and sawing operation up to an ideal standard of efficiency. Yet, if we are to believe the criticisms expressed so often among members of the lumber trade and industry, there is great room for improvement at the present time and the writer of these articles is performing a valuable service by calling attention to the situation in a manner which will leave no one in doubt as to how far the facts apply to his own case.

Competition Between Canadian and United States Stocks

In the section of the present issue of the Canada Lumberman which is devoted to correspondence from readers, will be found a letter from a Canadian lumberman, dealing with an article which was reproduced in these columns in the December 1st issue, on the question of yellow pine in the Canadian markets and Canadian lumber in the markets of the United States. The writer also deals with the views recently expressed in these columns by Mr. R. A. Long, of the Long-Bell Lumber Company, of Kansas City, U. S. A., in regard to the great quantity of yellow pine which is being sold in Canada at prices so low as to leave no margin of profit. The views expressed in the letter published in the present issue are of much interest because they state the case from a Canadian point of view and are based upon an intimate knowledge of conditions prevailing in the markets both of Canada and the United States.

Perhaps the most interesting statement in the letter is that with which the writer closes his remarks, namely, that yellow pine is being sold in the United States to-day, at prices just as low as those for which it is being placed upon the Canadian market. The importance of this statement comes from the fact that many Canadians are

of the opinion that yellow pine is sold in Canada at a sacrifice, so as to avoid injuring the markets of the United States. Mr. Long, in his letters, has strongly opposed this claim and has stated that, from his own knowledge of actual sales, this is not the case. It is important therefore to have the views of a Canadian who admits that Mr. Long is right in this respect. If this point is admitted, it brings the matter down entirely to a consideration of the conditions which lead to the sacrifice of stocks, and this point is dealt with clearly by the writer, who points out a fact which we have frequently mentioned in these columns, namely, that one of the most important causes of sacrificing yellow pine stock in the United States and Canada, is the fact that a large number of the companies manufacturing this lumber are over-capitalized and over-bonded, so that the payments which they have to make in order to meet their indebtedness and to pay interest upon their capital, are so great that they are obliged to follow a policy of over-production during times of depression, hoping for improvement in the near future and seeking only to realize enough money to pay these debts in the meanwhile. This is a policy which has apparently become very general in connection with yellow pine

producers and which is reasonable enough, if the periods of depression are not prolonged or of frequent occurrence, but when they last for a long time, and the intervals between are short, the result is a permanent injury to all markets in which yellow pine is sold. This is exactly what is occurring to-day and has been occurring for many months past. Not only do the yellow pine manufacturers suffer, but the whole lumber industry feels the depressing effect, as most of the important classes of lumber and timber produced to-day find competition from yellow pine at one time or another. The only conclusion that one can come to, is that these conditions may be expected to continue indefinitely, practically until the demand for lumber outstrips the supply, and unfortunately, with the present enormous capacity of the mills in all parts of the country, this time is far in the future.

A point which is often overlooked, but which is of much importance in the consideration of this question is the greater facility of production possessed by yellow pine manufacturers, on account of the fact that they can produce practically all the year round. It would be fortunate if they had a period of rest each year as the operators in Canada have, during which they must allow their mills to take a rest, and during which they themselves have an opportunity to consider their production policy more calmly than if they were able to operate all the year round.

As to the costs of production in Canada and in the United States, we have read many carefully prepared articles and letters in numbers of trade journals proving conclusively, to the satisfaction of those who wish to see it so proved, that the costs of production in connection with their industry were greater than in others. Figures are the most versatile factors that one can have anything to do with in business matters and it is often difficult to disprove what others put forward in opposition to one's own convictions, yet, in spite of all that has been said upon this question, it is difficult to see how the claim for greater production costs can be upheld in connection with the production of yellow pine, as compared with Canadian pine or hemlock. The fact is beyond dispute that a mill which can operate all the year round and a camp which can be kept cutting day in and day out must have lower operation charges to figure against the product, than one which is obliged to remain idle throughout many months of each year. As to the stumpage charges, taxes, etc., in the different countries, they are likely to figure out on a fairly equal basis.

All these questions are of considerable importance in discussing the competition between United States and Canadian lumber and we would be pleased, in these columns, to publish the views of others, who are in a position to give opinions of interest upon this subject.

Minnesota's White Pine Industry

Three interesting bulletins have recently been issued on the wood-using industries of the states of Minnesota, Iowa and Florida. These bulletins are prepared in each case by the state forestry department in co-operation with the forest service of the United States. They contain a great deal of valuable information regarding the various classes of lumber produced in each of these states and also very useful information regarding the various industries which consume the lumber in their manufacturing operations. Each of the bulletins contains a section devoted to lists of uses of woods and lists of industries using woods, grouped according to the classes of wood used and according to the classes of industry using the woods.

In the bulletin upon the wood-using industries of Minnesota, the following information is published in reference to the white pine lumber manufacturing industry:—

"Massachusetts, which today produces more white pine lumber than Michigan, once the leader in the world's output, was once covered with fine white pine, but the original forests were cut long ago, and the present timber is all second growth. The annual cut of white pine in Massachusetts is now about 20,000 feet per square mile, averaged for the whole state, and in Minnesota about 16,000 feet. But Massachusetts cuts all of its output from second-growth, protected woodland, while Minnesota is merely harvesting the crop which nature planted centuries ago. Area for area, Massachusetts is cutting one-fourth more pine than Minnesota, and is raising every foot of it. Massachusetts keeps fires out; that is about all the difference. If Minnesota could control fires as well, the problem would be solved. Nature would do the planting as it does in the New England States. With the Minnesota lands growing pine as the lands in Massachusetts are, and at an equal rate, the state would yield 1,600,000 feet a year, not for one year only, but for all time. On account of the thinly settled condition of much of the northern country, the fire problem is, of course, more difficult in Minnesota than in Massachusetts; but an offset to this, there is much more land, in proportion to the areas of the States, in Minnesota than in Massachusetts, that might with profit be spared for forestry purposes. After making considerable allowance for fire injury, Minnesota might still produce as much pine, mile for mile, as the New England States.

"The geographical range of white pine extends from Newfoundland across Canada to Manitoba, a distance of 1,800 miles, and follows a belt with an average width of probably 400 miles. An arm of the pine belt runs south along the Appalachian Mountains about 400 miles, terminating in northern Georgia. Deducting liberally for vacant areas in this range, the actual primeval white pine lands in America could not have been much below 400,000 square miles. The

white pine propagates by seeds alone. Its seeds are winged, and the wind carries them a few hundred feet, and in time of storm may transport them long distances. They demand plenty of light, and seedlings grow best in open ground where their roots can quickly enter the mineral soil. Old fields on the leeward side of pine forests are often completely taken possession of by seedlings."

Referring to red pine the bulletin says:—"Red or Norway pine is second in amount used by manufacturers in Minnesota. It is the white pine's companion in nearly all parts of its range, except that it does not run southward along the Appalachian Mountains. Until comparatively recent years, Norway pine was little heard of in the lumber markets. It was bought and sold as white pine, and was mixed with it. Carpenters and builders generally knew the difference, and if necessary they could cull most of the Norway from the stacks of white pine, but it was not usually done. In the Lake States pineries, Norway pine has always been cut and marketed with the white. The proportion of the former in the forest was greater than the public supposed. The Norway stumps in old cuttings tell the true state of affairs in districts long ago cut over. No lumberman mistakes one pine for the other. They appear quite different as they stand in the woods. The redness of the Norway pine's bark furnishes a means of identification in most cases. The wood has a reddish tinge. For many purposes Norway lumber is as good as that of white pine; but it rates below white pine where color is a consideration. The fact that manufacturers in Minnesota reported the use of 169,000,000 feet of Norway or red pine and 463,000,000 of white pine is evidence that pretty close distinctions are now made between the two woods. The difference in their average costs is not great, white pine being a little more expensive."

The proposed new schedule of timber royalties to be paid by owners of timber limits in the province will be settled shortly after the close of the conference between Hon. W. R. Ross and the British Columbia lumbermen in Vancouver on December 17th. At a recent conference held in Vancouver between the lumbermen and Chief Forester McMillan owners of timber limits suggested a possible basis for the new royalty schedule. This roughly provided for a sliding scale in the royalties, differences being shown between the coast and mountain limits. The schedule suggested by the lumbermen was to extend over some 40 years. Following his return from the east Hon. Mr. Ross looked over the proposals of the lumbermen and arranged to meet them in Vancouver at the close of the forestry convention to be held there on December 15th and 16th.

Woods Used in Maritime Provinces

Industrial Consumption of Native Material Greater than in Ontario by Comparison

The Forestry Branch of the Department of the Interior has just completed a study of the wood-using industries of the Maritime Provinces. The results of this study in bulletin form will be ready for distribution early in the new year. A similar study in Ontario was completed some time ago and is described in Bulletin No. 36 of that Branch, which can be obtained free by applying to the Director of Forestry, Ottawa. A comparison of these two studies brings out many interesting points.

Wood-using industries, as described in these studies consist of those industries which purchase wood in the log or in the form of rough lumber, and work it into their final products, or use wood as a means of manufacturing their products. Industries which purchase manufactured stock and merely assemble it are not included in the studies.

Comparisons With Ontario

In an average year in Ontario 807,456,000 feet, board measure, of lumber is used by these industries. Of this total 18 per cent. is purchased outside the province, coming mostly from the United States and consisting largely of woods that grow in Ontario at the present time. Owing to wasteful utilization, loss through forest fires and lack of consideration for the future the supply of these woods has become practically exhausted in Ontario. A total of 144, 879,000 feet of lumber is imported annually into Ontario by the firms engaged in these industries, of this total 104,962,000 feet is composed of woods that grow in Ontario at the present time. This means that almost three-quarters (72.4 per cent.) of Ontario's imports for these industries would have been unnecessary if proper provision had been made in the past to perpetuate the existing supply of native woods.

The only woods imported which do not grow in Ontario are the southern hard pines, cypress, red gum, Douglas fir, mahogany, Spanish cedar, pencil or red cedar, ebony and small quantities of rare tropical woods. The total of these necessary importations amounts to less than a third of the imports.

Ontario has an abundant supply of such woods as spruce, birch, beech, balsam, fir and poplar, but the use of these is not fully understood. Prejudices exist against these woods for some purposes in favor of others of which the supply is less abundant. 38,616,000 feet of birch is used in Ontario and 36,136,000 feet of oak is imported. In many cases birch can be substituted for oak, but the prejudice against birch in favor of oak prevents this substitution, and these enormous quantities of oak must be imported.

Birch, elm and ash can be used to advantage in vehicle work in place of hickory in many instances, but over eight million feet of hickory is imported annually, as the native supply is practically exhausted.

Maritime Provinces an Object Lesson

In utilizing native woods to the best advantage the Maritime Provinces stand as an object lesson to the rest of Canada. In an average year, these provinces purchase 204,463,000 feet of lumber and of this they import only 12.3 per cent. as compared with 18 per cent. in Ontario. Furthermore, this 12.3 per cent. is made up, for the greater part, of woods that do not grow in the Maritime Provinces or have never grown there in commercial quantities. Only 25,162,000 feet is imported annually and of this quantity over 82 per cent. is composed of such woods as southern hard pine, Douglas fir, tulip, cypress, chestnut, mahogany, cherry, walnut, hickory, lignum-vitae, California redwood and red gum, which do not grow in the Maritime Provinces.

Spruce heads the list of woods used as compared with pine in Ontario, and is used as a substitute for pine in almost every industry. Balsam fir, in Ontario, comes twelfth on the list and is used in quantity only for cooperage, pulp and rough building material. In the Maritime Provinces this wood comes fourth on the list, and is used by nine out of the total twenty industries. It goes into interior house finish, boat building, boxes, casket cases, handles and brush backs, vehicles and miscellaneous products in addition to its uses in Ontario.

Birch, oak, maple and beech are the important native hardwoods in place of maple, oak, elm and basswood in Ontario. The four most important hardwoods in the Maritime Provinces are largely native material, only 13.3 per cent. being imported, as compared with 21.8 per cent. for the four chief hardwoods used in Ontario.

Car Industry the Chief Importer

The car industry in the Maritime Provinces purchases the greater part of the imported woods. Except for this industry, which uses 21,853,000 feet of imported material, the imported wood used by the wood-using industries in the Maritime Provinces would amount to less than two per cent. of the total.

The manufacturers of excelsior in the Maritime Provinces con-

sume a total of 900,000 feet board measure of poplar. The manufacturers of cooperage, boxes and fruit baskets, consume another 790,000 feet. Almost two million feet of the wood is consumed annually and it comes tenth on the list as compared to seventeenth in Ontario. New uses of poplar are important to the prairie provinces where so much of this material is found.

The bulletin contains detailed descriptions of the different woods used and of the industries using them. It will also contain a directory of the manufacturers who supplied the data used in its compilation.

Montreal Association's Annual Meeting

Montreal, December 8th; (Special to the Canada Lumberman): Members of the Montreal Lumber Association held their annual meeting in the Board of Trade office today. Mr. Arthur H. Campbell presiding. Those present were: Messrs. W. K. Grafftey, G. W. Grier, D. H. McLennan, W. A. Fillion, T. J. Rutherford, W. Williamson, P. D. Gordon, Alexander McLaurin, E. M. Nicholson, and Mr. Stanley Cook, the secretary.

The report of the president reviewed the subjects under consideration during the year. One was the allowance from track scale weights, on which the opinion of the members of the association were presented to the Railway Commissioners, who have not yet given their judgment on the matter.

The Association, with other branches of the Board of Trade, made representations to the Railway Commissioners urging the adoption of the principle of reciprocal demurrage. The Association desired that the commission should impose on the railway companies a demurrage charge for every day's delay over forty-eight hours in the lifting of cars after they had been loaded by the shipper, and for every day's delay over forty-eight hours in placing cars for unloading after they arrived at destination. In the view of the association, the administration of the car service rules should be placed in the hands of an official under direct control of the Railway Commissioners and entirely independent of the railway companies. The members of the association also favored the adoption of the principle of average demurrage as an alternative to reciprocal for those whose business might be best suited thereby.

The association had under consideration the regulations governing the stop-off arrangements on lumber destined to United States points. The stop-off arrangement as affecting Canadian business was satisfactorily settled by negotiations with the railway companies last year. In June of this year a tariff was proposed by the railway companies covering stop-off arrangements on lumber for United States points, and a committee met representatives of the railway companies on October 1st, when the matter was fully discussed. The railway representatives expressed themselves as being desirous of assisting the Canadian manufacturer in competition with the American manufacturer, so that Canadian mills might, as they should, secure a larger proportion of the business of dressing and resawing lumber for export to the United States. The arrangement is still the subject for negotiation with the companies, and the committee hope for success in securing the adoption of all its recommendations in this connection.

The members, during the meeting, took up the question of the connection of Montreal with the Transcontinental Railway, and decided to ask the Council of the Board of Trade to approach the government again on this subject, and to urge the importance of the immediate construction of a branch line connecting Montreal with the main line of the Transcontinental over the shortest possible route. In this connection, it was pointed out that some four or five years ago the Board of Trade had the positive assurance of Mr. F. W. Morse, then general manager of the Grand Trunk Pacific, that by the time the Transcontinental was completed the Montreal connection would be in running order. The road is now practically complete, but there is no sign of any branch to Montreal. The interests of the city are suffering severely thereby, particularly those of the lumber trade, as the only present means by which Montreal can reach the main line is either by La Tuque Junction or by the T. and N. O. road.

The continuance of the embargo placed by the C. P. R. on the traffic from other lines destined for team track delivery at Mile End was severely criticised by members, it being felt that it is unjust to maintain the embargo for over a year. It was decided to take up the matter, if necessary, with the Railway Commissioners.

The following officers were elected: Messrs. Arthur H. Campbell, president (re-elected); P. D. Gordon, vice-president; F. W. Cotter, treasurer; Geo. Esplin, T. J. Rutherford, W. A. Fillion, and D. H. McLennan, directors. Mr. Arthur H. Campbell was unanimously chosen as the association's nominee for re-election on the Council of the Board of Trade.

Mr. J. Stanley Cook, secretary of the National Lumber Association, was, on November 8th, presented by the members of the association with a writing desk and chair, and two large arm chairs. The gift was made as a wedding present.

Quebec Leases Discussed in Legislature

During the debate on the Budget in the Quebec Legislature the question of the duration of timber leases granted by the Government was raised. Mr. J. Hall Kelly, in defending the Government, pointed out that the revenue of the Forestry Department had increased from \$879,000 to \$1,760,000, and the ground rent had been increased from \$3 a mile to \$5 a mile. The Government had also increased the amount charged per thousand feet on spruce and pine cut on the limits.

To-day a man coming into the province to invest money in lumber is not the sole owner, but the joint owner with the Government. The Government has the right to change the rate of stumpage and the ground rent, if it wishes. It holds the master card, and governs the situation. The Government says to the limit-holder in effect: "We will allow you to take hold of a certain tract of land, providing you respect the regulations, pay ground rent and stumpage, and observe any new regulations that may be issued. You can have it for ten years. After that it is renewable annually."

A discussion between Mr. Kelly and Mr. Lavergne and Mr. Provost followed as to whether it was a perpetual lease that was given or not. Mr. Kelly contended that it was an annual lease, and could be cut off by the Government twenty-four hours after a year's lease had expired. The land was not held in fee simple.

Mr. Provost declared that the limit-holder could insist on the renewal of his lease if the Government did not want to do so, and Mr. Lavergne read from the statutes to enforce the point.

Mr. Kelly cited the case where the Ontario Government prohibited the export of pulpwood, and the judgment they obtained when the case was brought before the court, showing that they were masters of the situation. But because the Government had that right was a reason why they should exercise it with great discretion. He himself had occasion to borrow money on limits obtained from the Government at the present rate, and he had always been asked, "What guarantee can you give us that the Government will not revoke your lease at the end of a year?" He had always replied in the same way that they had no guarantee except the honesty of the Government.

Mr. Kelly pointed out also that the law had been made subject to the existing regulations. That the Government held the master card was shown by the fact that they had the power to increase the ground rent when they wished, and also by the fact that they prohibited the export of pulpwood, unless there was a mill in the province belonging to the company. He suggested that it would be a good idea if the length of time that a lease would be given should be twenty or more years, the average length of a bond. It would then be much easier to interest capital in developing these limits, because there would be more security.

There were two hundred sawmills in the province said Mr. Kelly, with an average capacity of twenty thousand feet a day, some of them cutting one, two or more hundred thousand feet of lumber a day. Of the smaller mills there were 1,880 with an average daily capacity of less than 20,000 feet a day. There were forty-one pulp and paper mills in the province and in a short time there would be more pulp and paper taken out of Quebec than from any part of North America.

Forest Protection in Canada

"Forest Protection in Canada, 1912," is the title of an interesting publication which has been issued in book form by The Commission of Conservation of Canada. The book is a report prepared by Clyde Leavitt, M.Sc.F., Chief Forester of the Commission and Chief Fire Inspector for the Dominion Board of Railway Commissioners. It contains an exhaustive consideration of the whole question of forest protection in Canada. An excellent section of the book is devoted to forest fires and the brush disposal problem. Other sections relate to protection from railway fires, top-logging, the use of oil as locomotive fuel from a fire-protective point of view, forest planting in Canada, and a report of the committee on forests of the Commission of Conservation. The appendices include a description of Dominion Forest Reserve extension, a memorandum regarding the country between Sudbury and Port Arthur, by Mr. J. H. White, and an interesting series of opinions on oil fuel. It is extensively illustrated with half tones and maps, and altogether is a book which will be of great value and interest to all who are connected with the lumbering industry and those who take an interest in forestry problems in Canada.

Want Subsidy for Steamship Service from B. C. to East

Montreal, December 6th.—In view of the opening of the Panama Canal, the Quebec Board of Trade have passed a resolution asking the Federal Government to encourage steamship communication between the eastern provinces of Canada and British Columbia, so as to cheapen the cost of transportation between east and west and to prevent Canada losing any portion of the existing trade between the provinces. If necessary, it is urged, the government should subsidize a line of steamers to run at regular intervals between the St. Lawrence and Maritime ports and Vancouver, through the Panama Canal.

Pioneer Vancouver Island Company

Shawnigan Lake Lumber Co., Ltd., have been operating
nearly a Quarter of a Century!

Old-timers on Vancouver Island, when endeavoring to fix the date of some far-off incident in their own career or in public history, as a rule start off by saying, "I recollect it was about the time 'Pop' Elford started operations at Shawnigan Lake."

It was as long ago as the year 1890 that the Shawnigan Lake Lumber Company commenced logging operations in the virgin tim-

Logging Operations at Shawnigan Lake.

ber then surrounding that attractive body of water, which has since become a notable pleasure resort. Primitive and crude was the initial equipment, in the light of present-day methods, but it was not a whit behind the best in vogue in the province in those early days. Four stout yoke of oxen hauled the logs to the sawmill on the waterfront, and later to the lake to be boomed and poled along the shore line—a slow and laborious operation. A couple of years later, horses were substituted for the oxen to secure greater efficiency. Next came the "pole" road into the timber, the cars being pulled by horses. Then horses were dispensed with in favor of steel rails and power traction. Today the company operate a little over five miles of well-built railway, equipped with two Climax locomotives and a complement of steel trucks.

Two camps and four donkeys are operated during the greater part of the year, the timber handled being principally fir, with a good sprinkling of cedar and hemlock. The camp buildings and equipment are of the best. The company's sawmill was entirely rebuilt a couple of years ago, and has a daily capacity of about 75,000 feet. A considerable percentage of the cut usually finds a market locally, and in Victoria, where it is in strong demand with builders, owing to its

Logging Train on Shawnigan Lake Operation.

careful manufacture and good quality. Shipments are also made to the prairies, and Eastern Canada, the long timbers, for which the plant has special facilities, being in strong demand in Ontario.

The Reader's Viewpoint on Trade Topics

Opinions on Questions of General Interest—Westerner Expecting Good Trade—Yellow Pine Again to the Front

Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few that have been received lately:—

A Welcome Note of Encouragement

Editor Canada Lumberman: Grand Forks, B.C., Dec. 3rd.

Replying to yours of 24th ulto, as to why we expect the year 1914 to be an improvement on 1913, we will give you our reasons below.

It will first be necessary for us to understand the reasons which have made the year 1913 unprofitable, in order to make a comparison with the year 1914.

In the fall of 1912 the large majority of the operators closed their operating season with good assorted stocks on hand. The demand from the prairie provinces was good, and everything pointed to a magnificent trade in the spring of 1913. Owing to the prevailing opinion among the manufacturers that 1913 would be a banner year, those manufacturers who logged during the winter took out exceptionally large stocks of logs.

The spring trade opened up very strong, but unfortunately the general money stringency caused a general curtailing of building operations. Unfortunately also, at least half of the manufacturers were so loaded up with logs and lumber that they were compelled to dispose of their lumber at a price less than the cost of production.

During the winter of 1913-1914 there will not be over one-quarter of the logs taken out, that there were during the winter of 1912-1913. The labor market is a good barometer in this regard, and large numbers of good competent lumber jacks are looking for work, and in the majority of cases staying with the job; a very marked contrast with the past two years. Wages for bushmen are consequently lower.

The stock of lumber on hand is not any larger than one year ago, and the greater part of the lumber on hand is held by the stronger operators, who will not sell until they see a profit.

The demand during 1914 will be greater than during 1913, owing to the loosening up of the money bags, the magnificent harvest and the increased immigration, especially from the middle states, as these people all bring money into the prairie provinces.

In support of our contention and desire we will start our mills as early as possible and we will have sufficient logs to run our mills until the lakes freeze up in the fall.—W. Mark DeCew, vice-president and manager, Western Pine Lumber Company, Limited.

A Canadian's View on Yellow Pine

Editor Canada Lumberman: Toronto, Dec. 8th.

I have read with considerable interest two articles in your issue of the December 1st, one entitled "Canadian Lumber Competing in U. S. A.," the other, "Why Cheap Yellow Pine Floods the Canadian Market."

In answer to the "St. Louis Lumberman" which is writing about the influx of Canadian lumber into the United States, he would certainly have written in a much different strain, were he more conversant with lumbering conditions in Canada. He speaks about the advantage the Canadian lumber manufacturer has over the American on account of the lower stumpage cost. This opinion is quite erroneous, as can be seen by looking up the bonuses paid to the government for the privilege of cutting the timber. In some instances it runs as high as \$14.25 per thousand feet b.m., to which has to be added Crown dues of \$2 per thousand, an annual ground rent of \$5 per square mile and fire ranging costs which are about \$3 per square mile. There is also the interest on the estimated value of the limit which the government exacts. Then again, the cost of operating is much heavier in Canada, owing to the topography of the country. In many cases it costs \$10 to \$12 per thousand to put the logs on the bank of the stream or river as the case may be, to which must be added driving and towing costs of not less than \$2 per thousand. Then, in addition to all the above disbursements, there is a towing waste of ten per cent. The average cost of white pine logs at the mills in Ontario is \$25 per thousand feet; hemlock \$15 as compared with yellow pine costs of \$7.50 to \$8.

The "St. Louis Lumberman" makes further complaint about the

antiquated marine laws of the United States as a working adversity to the lumbering interests of the American lumberman. Similar laws are in force in Canada, therefore the Canadian lumberman has no advantage over his American competitor in this respect. The real cause of trouble with the American lumberman, I think, is the long logging season, practically the whole year, which enables them to overproduce; also over capitalization and bond issue which forces them to operate whether profitable or otherwise, in order to meet their obligations. If unprofitable, the meeting of their obligations has to come out of the stumpage, and if persisted in will inevitably spell disaster in capital letters.

The Canadian lumber manufacturer cannot overproduce as easily as the American, for the reason that the logging operations are confined to not more than four months and the Canadian lumberman knows by the middle of May what the visible output is, and can, in a measure, regulate his trade and prices to suit the conditions, whereas, in the United States the only regulator is the capacity of the mills, which is easily added to, should it be thought necessary to do so.

The lumber manufacturers of Canada have had the keenest kind of competition from across the border, as yellow pine has been put on the Canadian market for years at less than the cost of the Canadian logs and in very few instances has there been complaint. At the present time yellow pine is being delivered in Canada at lower prices than hemlock. It is therefore obvious that the removal of the duty from Canadian lumber importations into the United States has nothing to do with the trouble the lumber manufacturer has in the United States. The trouble can be attributed to the reasons mentioned formerly, viz.: overproduction superinduced by over capitalization and over-bond issue.

In regard to the letter from Mr. R. A. Long: At the outset he says there is nearly always a surplus of "odds and ends." In answer to this I may say that, at present, everything from "B and better" to No. 3 common, must be odds and ends, if price is any indication, as everything is not less than \$4 lower than it was a year ago, and in many instances as much as \$6 off. He tries to show that the sinners are the small mill-men, but it is unsafe to throw stones when living in glass houses as there large operators putting lumber on the Canadian market under what looks like forced conditions.

In conclusion, I may say that Mr. Long is correct when he states that lumber is not being sold at less on the Canadian market than the American. I was of that opinion some time ago, but put myself right by personal investigation.—W. J. M.

The Cost of Surveys—Mr. Sewall Replies to Criticism

Editor Canada Lumberman: Montreal, Dec. 5th.

Referring to a letter in the December 1st issue of the Canada Lumberman, signed by Mr. R. O. Sweezey, of the Montcal Engineering Company, by which Mr. Sweezey answers my letter published in your November 15th issue, where I stated that the advertisement of absolutely accurate results in timber estimating at a cost of less than 1 cent to about 4 cents per acre, is misleading and untrue, I would say:

Mr. Sweezey fails wholly to make a case, answering definite figures as he does by generalities. My letter states the lowest cost of an estimating crew, showing that a percentage of area only can be covered at the cost mentioned. Mr. Sweezey departs from the question entirely and takes up the following points in order:—

- (1) Many lumbermen do not like Foresters.
- (2) Scientific forestry does not make high cost, but lack of experience and ignorance do.
- (3) There is a tendency among forest engineers to apply European methods or to make too detailed surveys.
- (4) Experience is a prime necessity in obtaining reliable results at reasonable cost.

I reiterate that the lowest priced competent cruising crew on a basis of \$5 per diem entire expense, cannot "count" the trees on more than 30 to 40 acres per day, much less measure them, and that the ordinary crew of a cruiser and assistant will cost much more per day than \$5, and will not count the trees on more than 12 to 20 acres, that at 1 cent per acre the \$5 crew must cover 500 acres of land, and at 4 cents must cover 125 acres; that therefore a percentage only of area can be actually seen and counted and that Mr. Sweezey's claim of "absolute accuracy" is unwarranted. My figures are based on over 10 years' experience in cruising Maine and eastern Canadian timber lands.

I gather from the context of Mr. Sweezey's final paragraph that

he does not advocate the use of calipers in checking measurements, so that his "absolute accuracy" is to be obtained by eye alone.

Mr. Sweezey states in his letter that contour lines are unimportant and expensive. I beg to differ from Mr. Sweezey in this statement. If country is rough and complicated, the contour lines are a great assistance in planning logging operations; if country is flat and topography simple, they are not necessary. The cost of barometric contour lines, sufficiently accurate for logging purposes is very small, as they may be obtained by the cruiser reading his barometer at important points, with a barograph in camp to correct atmosphere, and a few level lines to control the country. I have found that a cruiser covers about so much country per diem, and does about the same amount, when he reads his barometer as when he does not.

Mr. Sweezey practically states that "absolute accuracy" is different in different places. I suggest this is not so. I further ask that Mr. Sweezey quote some figures and give some definite information that will back his claim of "absolute accuracy" in timber estimating. In the most careful and detailed timber estimates by the most experienced and competent men, I have never heard a claim of "absolute accuracy" before, regardless of the cost of the operation. How any one can claim such, and then deny the use of instrumental helps of detailed work, is amazing. Even on the landing, where every or nearly every log is scaled we have never considered we could obtain "absolute accuracy."

Will Mr. Sweezey please quote figures?—James W. Sewall.

Conservation in Manufacturing

Editor Canada Lumberman:

We hear and read a lot about saving lumber in the woods but the writer is convinced that there is a big waste of good lumber going on right in our so-called "modern" mills. I have some ideas on the subject which I would like to let loose.

First and worst: At the present prices of lumber there is no excuse of using such a wasteful rig as a circular or rotary saw to cut logs into lumber. Hemlock is about one of the cheapest woods we have and it is generally sawn into plank. An ordinary circular mill with a steam feed carriage cuts about 40,000 ft. per day in good logs. A band saw will cut just as much lumber per day and from the same number of logs will cut from four to five thousand feet more lumber. True, it costs more to install and operate a band mill, possibly ten or twelve dollars per day more than the circular, but at present prices of lumber, the mill man, cannot, in justice to himself, continue to slash away good lumber into the sawdust pile or burner.

Then there is another "waster of value" in common use in our mills, i.e., the stock gang. For small logs (6 in., 8 in. and 10 in. stock) they are all right, but in almost every mill I have been in there is a tendency on the part of sawyers and foremen to keep the gang busy, and many twelve-inch stocks are sent to it. As a consequence a lot of good sidings are cut into a thickness which is not most valuable.

During the past few years, there has come into the market a machine known among mill men as an edger gang, using a cluster of saws and each saw cutting out about 5-16-in. saw kerf. It usually takes logs which have been stocked 8 in. and under. This machine is open to the same objection as the gang. The sawyer passes many eight-inch cants to it that should have been left wider. It is also a very wasteful rig. The saw kerf, in cutting up an 8 in. cant with four-inch faces, will amount to 8 ft. board measure, more than if cut on a 17 or 18 gauge resaw. This has been proven out several times to the writer's knowledge on 16-ft. logs, sawn into inch boards. As these machines cut up from 800 to 1,200 logs per day one can readily see where a man can talk conservation around a rig of this kind.

Taking everything into consideration, the writer is convinced that the ideal outfit to saw any kind of lumber is one or more double cutting bands and band resaws. With these machines one can cut lumber to sizes and grades that will best suit the market and with minimum waste for saw kerf. Apart, however, from the waste incurred by lowering grades and increased saw kerf, the writer notices a good deal of waste caused by carelessness. Very few mill operators in Ontario pay any attention to how the logs come into the mill. If logs are brought in top first, the slabs will be lighter and the edgerman will get more out of his machine and will waste less in edging.

In the mad rush to get "big count," very few sawyers pay sufficient attention to placing logs on the carriage. As a result splits and gum seams, etc., lower the grade and value of almost every board in some logs. I have often seen careless sawyers throw away their day's wages in cutting up one good big log.

There is a growing tendency to trim odd and even lengths on all lumber. This is certainly a move in the right direction. A few months experience in a sash and door shop will convince anyone that it is a mistake to trim shop lumber. The inch or so taken off in trimming often spoils the length. This also applies to all lumber used in a box shop.

What to do with the waste of a mill is the problem that every

mill man has to work out to suit his material and circumstances. Lath, pickets, box lumber, basket bottom stock, shingles, broom handles and heading, box shooks, pulp and other commodities have been and are being manufactured from mill waste. During the past few years, labor has been so scarce that most mill men have been prevented from doing anything to utilize the waste from their mills and very few care to put much money into machinery and plant for this purpose unless their timber holdings are large enough to provide many years' work for their mills. No one doubts that there is much value in what goes into our burners and slab and fuel piles, but I have yet to hear of any lumberman who has made money enough to compensate him for the investment on his machinery and plant and care and trouble involved in making use of the usual mill waste other than lath or box wood. If there are any who have made money at it, many readers of this journal would like to learn how they do it.—Ben Aroundsome.

A Few Drive Problems Considered

Editor Canada Lumberman: Maynooth, Ont., Nov. 25.

Following up my letter of August 16th, re up-to-date logging, I now submit through your paper, my views of up-to-date river driving, and the latest and best methods of obtaining and hiring the best men. Like logging, river driving is a trade which can be learned only by actual experience and requires years of such to get anything like a fair knowledge of how to move a winter's cut of sawlogs, ties or pulp from the woods to the mill in this wonderful but natural way.

I have had fourteen seasons of experience in this work, in different capacities, such as clerk, foreman and walking boss, and have also had experience in handling a warping tug, having been skipper on one for a season, in which capacity one obtains practical working experience, and first hand knowledge as to the fastest way of rushing a drive.

The ways and methods of river driving have improved much of late years, and one of the greatest improvements is the warping tug or alligator, built by West & Peachey, of Simcoe, Ont. These people have done more in the way of shortening the time spent on drives than any or all the river men in America. By introducing their steam warping tugs they have sent all the boat winches and horse capstans to the back ground, and have enabled the lumberman of today to get his logs to the mill in a month or two, while without this equipment he would have to stand the expense of an all summer's drive, and often have to hang up on account of low water late in the season.

No doubt there are some places yet that do not require the alligator, such as rivers and creeks, but such places as a rule are very scarce. All the handiest of Ontario pine being cut off, as a rule, drives are long now-a-days, and lakes play a large part in the driving. In such places a warping tug will generally cut your wages account for the drive in two.

Stream Improvements

A great many drive managers are averse to spending any money in improving a creek or river, such as blasting out rock, building dams, slides, side piers, booms, etc. Such men are always in trouble during driving season, and often melt with that dreaded result, being stuck, which is always a heavy loss to the owners, and which might easily have been avoided by a small expenditure on improvements. Very few rivers or creeks are in a fit condition to be driven in their natural state, and it is my opinion that money spent in properly putting necessary improvements on any river or creek is a good investment to the owners.

To get the best results from a drive, it is necessary to be prepared in the following manner, viz.: where lakes are to be driven have lots of good boom timber, and lots of chains; have all improvements gone over and repaired before starting the drive. See that your dams are not leaking; that your glance booms are in proper shape; that your boom timber is in such a shape that you can get it ahead of your logs; have your chains, boats, peavies, pike poles, and all such equipment ready and placed where they are required to be used first; in short have everything in readiness to commence driving as soon as the ice is gone. Wind and water will wait on nobody, so it is always best to be prepared to commence as soon as the lakes or rivers are clear of ice, and besides, you can have this work all done by men working for winter wages, which are much below driving wages, as men are to be had at a reduced scale of wages while waiting on the drives to start.

The Foreman's Importance

Having everything in readiness the next step is to procure a good live foreman, and, whatever men you require, getting them on the job as soon as possible after the ice is gone. Board them well and work them every hour you can, and do so within reason. If this method is followed and you have a good live foreman on the job at all times, you will find that there will be no friction or kicking among your men and you will never incur the expense of hanging up your drive.

There is practically no use in making any suggestions as to the

way to work on a drive, as different streams require different methods, but I might say that a great amount of the success depends on your foreman, and upon his being on the works continually.

Hiring the Drive Crew

In regard to the hiring of men, I may say that this is a subject that can be discussed at length, as there is a great amount of dissatisfied labor that leaves the lumber camps each season, particularly so in the spring. In my different capacities I have had a large experience in this, and I have always noticed that a large percentage of the shanty laborers are always dissatisfied with their settlement. Now this is not usually caused by the company's officers (clerk and foreman) but usually originates through promises and things told them by the employment agent at the time they are engaged. It is a known fact that any employment agent engaging men for a company for a fee of so much per man, will make only the bright side or good points of such company appear to the prospective employee. If they would only stop at this and not stoop to lie, it would not be so bad, but as a rule most of them will stop at nothing in the way of making things appear easy to the individual seeking work, telling him it is easy to get in the place of work, work not hard, when you get there, only five miles from station, etc.; when in reality it may be thirty. Eggs on toast for breakfast, etc. Such are the usual methods used by employment agents, while in reality they know little or nothing regarding the conditions of the work, the distance to walk, board or anything else about the company whom he is hiring for, except the usual information given him by the one who has engaged him to do this work. Now the only way to obtain any satisfaction out of a gang of men hired by an employment agent is to lay down a set of facts indicating the distance operations are from station, the kind of work to be performed, wages, etc., and make him fill in the same and hand it to each man engaged. It can then be collected from the men on their arrival at work. There will then be a thorough understanding between employer and employee, and much trouble will be saved at the time of settlement. This is a good system and companies would benefit largely in obtaining good laborers, by trying it. But the only really satisfactory method of obtaining men that are good workers and stayers is to have your own employment agent working on salary to do your engaging. In this way nobody is benefited by doing any lying and he does not need to make things appear any different from what they are. By using this method and treating your men right you will have the pick of the laborers who follow shantying and in a year or two you will not require any employment agent as the same men will be on hand at the commencement of each season and will stay with a company who will use them right from year to year.—Edgerton Martin.

Economy in the Mill—An Instructive Comparison

Editor Canada Lumberman:

I was looking at an up-to-date band saw a few weeks ago, cutting up lumber at the rate of about 50,000 feet in ten hours, and while the "hum" was going on an occurrence of the past came into my mind.

It was in the district of Lake St. John. I was young in the business then, and was anxious to see inside of anything that had the appearance of a saw-mill. There was a water power sawmill about two miles from where I was located that I had heard a great deal about, so one day I went to see it. The proprietor was alone in the mill, engaged in sawing small spruce logs 5-in. and up by 12 ft., into building material for the settlers.

The machinery consisted of one 48-in. Taylor water wheel directly connected to a wooden saw frame, and one saw arranged something like the old style English saw gate. When the logs were over 7-in. in diameter he sawed with this machine, but for logs under 7-in. there was a circular saw arranged in such a way that it could be put into operation without interfering with the frame saw, although the same carriage was used for the two machines. His method of sawing was to stand in front of the saw, load the log, start the cut, and walk to the back of the saw while the log was going through. He re-

moved the slab, and reversed the motion of the carriage for the next cut. This was done by means of a connection extending to the front lever.

The man had no help, and I asked him how he made it go financially. He made reply that he cleared one dollar a day and was quite happy. He supported a good sized family, and owed nothing. He built the mill himself with an occasional lift from a neighbor.

This man is in the sawmill business yet, but he moved the mill about half a mile up the river and installed steam power—and also improved his machinery.

While I was looking at the 50,000 ft. a day sawyer, I was thinking of my sawyer of thirty years ago and what would happen if the situation was reversed; I was reflecting over this when my attention was drawn to a log 8 in. in diameter, with a sweep of about 4 in. in its length, being thrown on the carriage. The sawyer turned it over so many times with the nigger that I thought he was trying to soften it so as to make a straight log. He gave it up, and in it went to the saw, and in less time than it takes me to write this the log was outside the mill in lumber and lath and mostly slabs. Probably some one will wonder what I am aiming at, well, I will tell you:—

Crooked logs are not numerous, and where pulpwood is cut they can be economically manufactured, but when they are to be cut into lumber, I would think that these logs could be made into short lengths in the bush; say instead of making a 12-ft. or 13-ft. log, make two 8-ft. logs, even if one had to go further up the tree. I think this would save lumber besides time at the mill.

There is a lot to be said about economy in sawing lumber, and the saving there should be in cutting slabs into marketable trimmings, so that nothing would be left to burn, except sawdust. Well, I, as a millwright would like to hear all about it from some one who has tried it.—W. Marsh.

The Increasing Cost of Production

Editor Canada Lumberman:

Exeter, Ont., Dec. 6th.

In looking back over the eleven months of the present year and taking into consideration the labor question, the increase in wages and the increased cost of production for all classes of material, we are almost at a loss to know when it is going to end, as it seems to us that the cost of manufacturing is advancing with great rapidity.

It is a difficult matter to obtain prices high enough to keep up with this advance in the cost of manufacture. So far as we personally are concerned, we have had the busiest year that we have experienced for ten years past, and while we cannot say at present whether our profits will be better or not, we are expecting them to show an improvement.

We have been buying only what we need for present work, as, with the amount of money it now takes to handle a lumber trade, we feel that we will be as well off by not buying at present. While there are times when money has been made by buying in advance, we feel that, taking all things into consideration, those who keep just enough stock to supply their trade will be as well off in the end as if they had put in larger stocks.

In looking forward to 1914, we do so with confidence, as we feel that with the degree of prosperity which we have enjoyed in Ontario this year, trade in general will be good next year.—The Ross-Taylor Company, Limited.

Toronto Retailers Active

Editor Canada Lumberman:

Toronto, Dec. 1st.

We find trade at present very good in our line, being a wholesale feed and retail lumber supply. We find we have been as busy this last month as any time since we have been in business. We find that house building has picked up very much, almost the same as in the spring time of the year, although we find collections a little slow, but feel that we will have very few losses in our collections. We are looking forward to next year being as good for our trade as the past year.—The Watt Milling & Feed Company, Limited.

Lumber Stocks for Agricultural Implements

A manufacturer of farm implements, in a letter to the Canada Lumberman regarding articles which have appeared in these columns urging the use of Canadian woods, writes as follows:—"We buy large quantities of Canadian woods. In fact, we buy all we can get that is suitable for our work at reasonable prices, but there is a great deal of lumber which we have to import from the United States, for the simple reason that it does not grow in Canada any more. This refers largely to oak and white ash, and for some of these woods we have had to substitute long leaf southern pine. There is nothing that we have yet found which will take the place of white ash for some parts of machines and be equally as strong as southern pine. We use large quantities of black ash in the manufacture of certain parts of our machines and we use very large quantities of seconds, No. 1 and No. 2 common and good shipping culls for boxing purposes."

RETAIL METHODS COMPETITION

The competition for retailers, announced in the Canada Lumberman of December 1st, will close on December 31st. The announcement is repeated in this issue on page 38. Owners of retail yards and their employees should take part in the contest. The benefit will be widespread, and some one will win the prizes. Read the announcement and try for a prize.

A Talk With the Lumbermen of B. C.

No. 3—By Douglas Fir

I closed my last talk with the thought that the problem of conservation is a big one. There may be those who will not dispute this fact, nor its importance, but who will nevertheless, doubt its having direct application to any one but the logger. If there should be any who take this view I am at variance with them, for I believe that everybody who has any connection with the manufacture, buying, selling, or using lumber, has a duty to perform in helping to solve this problem, and in helping to sow the seed of a general education all along the line. The architect even, is not immune from the chill of the cold fact which is too often revealed that he can do much, if he will, to help us work out our problem. We all err, of course, because none of us are infallible. There seem to be different reasons though to suit the different cases. Some err through lack of proper training, some through weakness, others from force of habit, and a few, it would seem, from pure and unadulterated cussedness.

On the whole, I believe that the better class of logger performs his part toward the end sought in these articles with more intelligence than in sometimes the case in the mills, and in the other channels through which the log, or its product must pass, either directly or indirectly until it reaches its final resting place in the various uses to which lumber is put. With the logger there is waste in abundance, but for much of it there is a cause, for owing to the precipitous cliffs upon which some of our timber stands it is impossible to fall those monster trees and get them to the water without tremendous waste. Even on the more level ground, it is only by the utmost care and exercise of intelligent thought by men skilled in the art of falling these trees that waste is kept at a minimum, and even then it is sometimes so great that one cannot help wondering if man's marvellous ingenuity, so often seen in other things, will ever be turned in this direction with the result that these trees will some day be taken down and placed in the water without waste by breaking or splitting. I am not offering any scheme for doing this, nor am I pronouncing it either practical or possible, and yet, who can say that it never will be done? When an eastern woodsman takes his first trip up our British Columbia coast, and sees where some of our timber is being taken from and how the logs are taken to the water his astonishment is such as will dwarf any feeling that he may have had concerning wild and hazardous scenes of eastern practices.

Grading Logs in The Cutting

Then there are other loggers in British Columbia, of whom we cannot speak so favorably. Some of these seem to work without purpose or thought, as far as conserving goes, for they do not pay the same heed to falling the timber as the better class of logger does, and they seem to cut their logs with but one end in view—the facility of cutting, and getting them out of the woods. Logs from such operations are as often found to be cut just the neat length, or it may be an inch short of the length, which means that they are scaled back to the next even length, as for instance a log 18 feet long with nothing for trimming would be scaled as 16 feet, and would be so trimmed when it goes in the mill, and while I am ashamed to say it, yet it is true that millions of feet of valuable lumber have been wasted in our mills in this way in time past, and this seemingly without any one raising his voice against it.

This same class of logger never seems to give a thought to grading his logs in the cutting, but if convenience counts for anything, or even if it doesn't, he never seems to stop and figure out how to cut the tree up to the best advantage. We will suppose that the body of a tree is 110 feet long, is straight, and not broken, and that 24 feet of the butt is No. 1 grade, 68 feet No. 2 grade, and the balance No. 3. We will cut the butt log 24 feet, and it is 40 inches diameter. It contains 1,693 feet, at \$12, worth \$20.32. The next log is 36 feet long, and 36 inches diameter, and the next 32 feet long, and 33 inches diameter; the two containing 3,550 feet, at \$9, \$31.95, and the fourth log is 18 feet long and 31 inches at the top end, containing 746 feet, at \$6.50, \$4.85, making a total value of \$57.12. Now let us suppose that this tree is cut as follows: the first log 30 feet long, and measures 39 inches, it contains 2,008 feet, but it now grades as No. 2, so we will consider it along with the next one, which is cut 40 feet long and measures 35 inches. These two logs contain 4,145 feet, and at \$9 are worth \$37.30. The third log is cut 40 feet long, and measures 31 inches, containing 1,657 feet, at \$6.50, for it is now No. 3, it is worth \$10.77, making a total value of \$48.07, against \$57.12, which shows a loss to the logger of \$9.05 on this one tree. As this is on less than 6,000 feet, we will suppose that the logger is putting in 50,000 feet per day after this fashion. He would lose about \$75, or about \$1,900 per month, and then we wonder where the difference comes in between success and failure.

Of course some will say that what is loss to the logger in this

calculation is gain to the mill, but is it? The mill may gain a little in the last, or top log, but is not likely to gain anything in the others, as the clear that is in the butt log stands a very good chance of being lost to some rush order for this particular length, because 6 feet of this log is No. 2 grade, and consequently the log was graded No. 2, and bought as No. 2, and so it does not seem a loss to cut it up into dimension if we happen to have a rush order for this length when this log goes in the mill. If it had been cut for No. 1, it would have been graded and sold for No. 1, and would not stand any chance of being put into lower grades, because it would be known that it had been bought at too high a price to allow of it. Again it will be said that nobody would put the clear lumber that can be taken from this log into merchantable, or dimension, but let us watch. Here is the sales manager coming into the mill now, and we will see what he has got. Here is an order for 1,000 pieces of 8 in. x 16 in. x 30 ft., and perhaps as many more 32 feet, with also a large number of 3 in. x 12 in. of the same lengths, and this order must be gotten out in a rush. The mill superintendent or foreman informs the sales manager that there are not many logs of these lengths in stock, and perhaps suitable logs cannot be bought in time for this order. What happens to our clear lumber in that 30-foot log now? The sales manager has, by this time, taken cognizance of his error, and tries to get help from some other mills, but can not, as they have sufficient business taken at better prices. He comes back to the mill and ascertains that there are sufficient logs to fill the order by using what logs there are ranging from 30 feet to 40 feet long. This of course represents a greater loss than that incurred by putting the clear in the 30-foot log first considered into this order, but the sales manager committed us to the order before he ascertained the conditions, and it must be filled.

Did you ever do this my friend? If you say no, then I can only arrive at one of two conclusions. You either have greater efficiency in your sales department than some of us have, or else you are not familiar with the methods which your mill employs in filling these rush orders, because the writer has seen it done on many an occasion. We saw how it figured out in the case of the logger, and is it not within the bounds of reason to suppose that in such a transaction as the one in question the mill can figure out as great, if not a greater loss per thousand feet than the logger did, which would mean that a mill cutting 200,000 feet per day, if it was forced by egotism to do it, could lose from \$6,000 to \$8,000 per month quite easily. Yet we wonder why we have to work on so close a margin that our success can so easily be turned into failure. Isn't it marvellous? If this kind of thing is reprehensible, and it is, we must not blame the mill for it, because the mill has no alternative. The office had, but didn't avail itself of it.

Northern Hemlock and Hardwood Products

The Northern Hemlock and Hardwood Manufacturers' Association, in their report upon cut and shipments for October, 1913, say:—"Hemlock production in October was 10 per cent. less than in September and the hardwood cut 15 per cent. than in the preceding month. Hemlock shipments in October practically equalled shipments in September, while hardwood shipments increased 9 per cent. over the previous month.

The summary of reports for the last twelve months shows that during this period hemlock shipments have exceeded the cut by 3 per cent. and that hardwood production has been 6 per cent. greater than shipments. The production of hemlock and hardwoods combined has exceeded shipments by 1 per cent. since November 1, 1912.

Reports from 72 firms give these totals for October.

	Sawed		Shipped	
	Firms	M. Ft.	Firms	M. Ft.
HEMLOCK	48	44,291	63	38,994
Ash	21	270	21	762
Basswood	25	2,472	47	5,544
Beech	3	6	3	96
Birch	26	3,978	51	10,894
Elm	21	1,041	39	2,556
Maple	22	5,287	44	9,172
Oak	10	93	17	581
Mixed	12	3,145	14	2,185
ALL HARDWOOD		16,292		31,790
Total Hemlock & Hardwoods ...		60,583		70,784

Sawmill waste of Douglas fir, of which an enormous quantity is found in the western forests, is being used to make paper pulp by a mill at Marshfield, Oregon.

A thoroughly up-to-date sawmill with a capacity of 60,000 board feet a day has been erected, on the south coast of Mindanao Island. It is of American make throughout, and uses the modern bandsaw. This is only one of several such mills in the Philippines.

The Retail Dealer and His Problems

Have You Solved a Difficult Problem—Let Others Know How

Competition for Retailers

Retail Lumbermen have plenty of yard and office troubles. Everyone has his own way of handling difficulties. Send us a letter about one of your own problems and the way you handle it. We are offering prizes for the best letters.

Fifteen dollars for the best.
Ten dollars for the next best.
Five dollars for the third best.

If you do not come among the first three, you may be among the next five, to each of whom we will give a year's subscription to the Canada Lumberman. If already a subscriber, you will be given credit for another year.

It won't be any trouble to write and you may get one of the prizes.

Others will benefit from your idea, you will get the benefit from all the ideas of all the others.

Any yard or office problem will do. Make your own choice and write soon. The contest will close on December 31st and the prize winners will be announced as soon as possible after that date.

If drawings are necessary to illustrate your idea, they may be included, or a rough sketch may be sent, from which we will prepare an illustration. Make the sketch plain and our artist will carry out your ideas.

Three experienced retail yard men will be the judges.

The contributions will be numbered in the order received and the names withheld until the judges have given their decision.

No Discounts Versus Profits

No greater slogan has been evolved by modern commerce than this: "One Price Only." The passing of the day of barter was brought about by the recognition on the part of the merchant that haggling was not only bad for the buyer, but equally bad for himself. Painful experience proved beyond cavil that variable prices furnished a stuffed club which could be wielded with telling effect on prices by the skilful barterer, and that while the merchant might recoup by charging excessive prices on other items wherever possible, the system was uncertain and unsatisfactory at best.

The lack of recognition of this fundamental of modern merchandising in the lumber business is due largely to conditions in the trade which cannot easily be altered. The fact that there is a difference of opinion as to intrinsic and market values of lumber on the part of various individuals in the business, naturally means that lumber will be offered at varying prices, and the stress of competition requires the lumberman to offer his stock at one price here to meet current quotations, and at another there, to get in line with the quotations buyers have received on the stock. Thus the tendency to equalize prices, rather than to hold to a single price standard, is almost impossible to overcome, and the adoption of an invariable list which will not be deviated from is not a practicable proposition as far as the rank and file are concerned.

Prices are not cut and shaded and squeezed and hammered and juggled as the only means of changing values; more insidiously the plan of making "terms to suit," as the instalment houses say, has won its way even among members of the trade who believe that their lumber is worth a certain price and who insist on getting it. It is likely that few hardwood men realize the losses that they are suffering because of the fact that their prices are not net, and that the buyer is practically able to make his own terms in paying for the material.

A prominent lumberman in one of the leading markets recently said that he didn't make any money last year, although the volume of business was equal to the year before.

"Of course, it was pretty difficult to sell lumber during 1911," he conceded; "but taking that into account, I am still persuaded that something else is wrong. We should have made a better showing on the business handled, and the only possible explanation that I can see is that we gave our customers too much leeway about settling their bills."

Discussion of the same question with other members of the trade

indicates that the lumberman quoted above came pretty close to hitting the nail on the head. When you quote a price, and make it clear in your invoice that payment is to be made on a basis of two per cent. discount in ten days, net thirty, do you insist that the customer pay the full amount of the invoice if he sends you a check four weeks after the lumber is shipped? Or if he pays in sixty days and you have made it plain that your terms are net thirty, do you charge him for the accommodation at the rate of six per cent. per annum—which is probably what you have been paying the bank for the use of the money you got to tide you over until the delayed collections came in?

Probably you do not; you may reason in the one case that the buyer didn't have enough time to unload and inspect the shipment, and that the delay in the arrival of the stock gave him the right to more time in settling than the letter of the law permitted. So the two per cent. that came off at the end of thirty days was consigned to oblivion, and incidentally the profit record for the year shrank imperceptibly the while.

An elastic system of discounts and the extension of accommodations as to terms is the most graceful way of cutting prices and the easiest way to hide money, without being able to account for it, yet devised by the brain of man. The difficulty, from the first standpoint, is that not much advantage is gotten from it as a selling argument, and the seller is usually so little aroused as to the losses which he is suffering from this source that when he sells a bill of lumber, he does not realize, even though he knows that his customer will discount the bill when he gets good and ready to pay for the stock, that he is getting less than the invoice price for his lumber.

Take a concrete example. Suppose a car of quartered oak is shipped on a basis of \$45 a thousand. If a two per cent. discount is to be taken, the price is cut down ninety cents a thousand. That's pretty close to one dollar, and probably the seller would have refused an offer of \$44 a thousand for the stock, and would have to be argued with to be convinced that his lumber is going for just about that amount. If 15,000 feet are loaded into the car, the discount on the shipment amounts to \$13.50, and reduces measurably the profit made on the sale. This is assuming that the discount is taken in the legitimate ten days usually granted. Under that condition, it is pretty bad; but when the customer takes five weeks and then deducts the discount, it comes pretty close to being highway robbery.

The losses suffered through discounts hit the sawmill man harder than anyone else, for the reason that the wholesaler has a chance to even up in buying lumber from other people. But did you ever stop to consider the situation of the manufacturer? He pays cash for everything, and his bills are discounted by everybody. His timber is not only paid for in that manner, but frequently the timberman secures an even better proposition, getting some money down when the logs are contracted for, more when the trees are cut and the balance when they are loaded f.o.b. the timberman's station.

Then there is labor to pay for, which is a cash item; and the freight bills, for the railroads are canny enough to have the "Nothing Doing" sign in evidence when it comes to discounts. At that it is likely that their own purchasing agents seize a two per cent. discount on every bill that shows itself inside the office. Be that as it may, the sawmill man gets a chance to discount bills only for supplies and machinery, and these are ordinarily not sufficient to offset even a small fraction of what he loses through the discounts of the other fellows.

"I figured the thing out the other day," said a sawmill man disconsolately, in discussing the situation, "and I found that taking my business on an annual basis, I lose 60 cents a thousand in discounts. If I could eliminate that, my business would be a splendid money-maker; as it is, I'm lucky to be able to look my creditors in the face and tell them to have a drink. Sixty cents a thousand is a pretty heavy load to carry, considering all the others that we must shoulder; and that is one reason why I think the jobber has it easy. He can frequently buy lumber outright, sell it, collect his money and then pay the seller, discounting his bill meanwhile, even though sixty or ninety days may have elapsed.

Getting back to the question of the effect of discounts on prices, it can be said that the discount system proper is so firmly rooted that it would be next to impossible to abolish it; but every lumberman, especially if he realizes the fact that profits are being shaved down closer all the time, should see that his terms are well understood by his customers and are adhered to in settling accounts.—The Woodworker.

Figuring the Costs Accurately

The accurate figuring of costs in connection with any retail business is a matter of utmost importance, although the practice of some dealers would make one imagine that this was not always the case. A great deal has been published in the Canada Lumberman of late upon this matter. Realizing the necessity of accuracy and systematic attention to this subject, we reproduce a number of valuable suggestions and a practical system which has been worked out by the Cost Educational Association of Chicago, an association of manufacturers, jobbers, retail merchants, trade papers, and travelling salesmen, organized for the purpose of improving business conditions in retailing. The principles laid down in these suggestions can be applied to any retail business with profit. The effect of the suggestions, if put into practice, will be to show the merchant all his cost, thus enabling him to provide in his selling price for a reasonable profit. The general adoption of this principle would quickly do away with ruinous competition.

A glance at the accompanying diagrams will show that this problem, generally considered a very difficult one, is in reality quite simple, the important point being that every item should be included that can be legitimately figured in as an element of cost. Dealers may be found in many parts of the country who refuse to include in their list of cost items such factors as interest, rent, salaries, etc. How they can persuade themselves that these items should be omitted, is a greater problem to others than many of the ordinary business problems. Such a system of estimating cost is faulty beyond question and those who follow it are deceiving themselves. If they are carrying on a successful business they are lucky. Most of them are on the way to bankruptcy. Those who are successful in spite of such faulty methods, would certainly make much greater profits if they adopted the principles outlined in the accompanying suggestions. Every merchant ought to know where he stands in connection with the cost of an article which he sells, and should know beyond question what price he must sell at in order to obtain a clear profit, of a given per cent, over and above all legitimate items of cost. Unless he does so, he is treading on thin and very dangerous ice. It may be that by applying these principles, many merchants will be able to show only a very small actual profit. This is really where such a system pays for itself. If it shows only a very small profit, the merchant must immediately mend his ways and increase his selling price or must realize the fact that it is time for him to sell his business while he has a chance to do it himself, rather than wait until the sheriff looks after the sale for him.

COSTS OF DOING BUSINESS YEARLY STATEMENT

1. Taxes		
2. Insurance		
3. Fuel, Light, Water, Etc.		
4. Rent		
5. Salaries		
6. Clerk Hire		
7. Advertising

19. Interest on Total Investment		
TOTAL EXPENSE		
TOTAL SALES		
PER CENT—Cost of doing business.		
RULE—Divide Total Expense by Total Sales and result will be per cent of cost to do business.		
To fix selling prices see rule on next page		

EXPLANATION (of items on opposite page.)

1. **TAXES.** Include all taxes and licenses.
2. **INSURANCE.** Fire and all protection except life insurance.
3. **FUEL, LIGHT AND WATER.**
4. **RENT.** Include rent of all property used in the business or if owned by you, consider an amount equal to what it would cost if rented from others.
5. **SALARIES.** Include amounts to cover salaries of proprietor, partners, officers or members of their families employed in the business, equal to what their services would command elsewhere, if not already on your pay roll.
6. **CLERK HIRE.** Include canvassers and extra labor.
7. **ADVERTISING.** Include all money expended in advertising, or entertainment of customers in promoting trade.
8. **EXPRESS, TELEPHONE AND TELEGRAPH.** Include all amounts expended for these items where not added to invoice price of goods or charged to customer.
9. **OFFICE SUPPLIES, POSTAGE, ETC.** Include all bills for stationery, ink, pens, pencils, postage, stamps, etc.
10. **STORE SUPPLIES.** Include all bills for wrapping paper, twine, boxes, crating, brooms, etc.
11. **LIVERY, DRAYAGE, ETC.** Figure in all expenses of these items where hired of others.
12. **HORSES AND WAGONS.** If owned by you figure all expenses of their upkeep.
13. **REPAIRS.** This item should include all amounts paid to keep buildings in order if not figured in rent, also repairs on fixtures and equipment.
14. **DEPRECIATION.** Include a proper deduction (Some say 10 per cent.) from your last inventory of fixtures, tools and other personal property subject to decline in value because of wear and tear. Also depreciate goods carried over which cannot be sold at full or regular prices.
15. **DEDUCTIONS.** Include amounts allowed customers for damage or any cause whatever.
16. **DONATIONS AND SUBSCRIPTIONS.** Include money or goods donated to charity or public enterprises. (Private charities not included.)
17. **LOSSES.** Include notes and accounts which are uncollectible, also amounts paid attorneys for collections, and goods lost or stolen or sent out and not charged.
18. **MISCELLANEOUS EXPENSES.** Include all expenses not provided for above.
19. **INTEREST ON TOTAL INVESTMENT.** Figure interest on your total assets at the beginning of your business year (cash, notes, accounts, merchandise, etc.) If this is done it insures your getting profits at least equal to interest had your capital been loaned instead of invested.

Proposed Rate Advance to Canada

Railroads west of the Mississippi river have announced that, effective January 1st, they will advance rates on shipments of lumber and forest products from points in the Memphis territory to Canadian destinations from 1 to 5 cents per hundred pounds. The Southern Hardwood Traffic Bureau has already filed formal protest with the Interstate Commerce Commission against this advance and it is expected that it will be suspended until such time as the lumbermen have had opportunity to present their side of the controversy. The railroads attempted in September, 1912, to put through a similar advance, but were frustrated by the Interstate Commerce Commission. They withdrew from the hearing before that tribunal before a decision was announced by that body. The advance in the present instance differs from the former one in the respect that it is confined to the lines west of the Mississippi river whereas the previous one took in lines on both sides of the river. The present hearing in connection with the proposed advance of 5 per cent. in freight rates north of the Ohio and east of the Mississippi river is for the purpose of giving the rail-

roads an opportunity of presenting their side of the controversy. The proposed increase is regarded as a matter of vital interest to shippers of lumber and active and vigorous opposition will be encountered by the railroads.

Court Upholds Crown Lease

Montreal, December 6th; (Special to the Canada Lumberman): The Court of Appeals, Montreal, have reversed the decision of Mr. Justice Weir in the case of Turgeon v. Esplin, which was an action to compel defendant, a box manufacturer, to vacate a tract of land adjoining the Lachine Canal of which the plaintiff has a Crown lease. Mr. Esplin has a prior lease of an adjoining tract with a right of passage over a portion of the plaintiff's leased land, and stored lumber on the latter ground. He disputed the right of the Crown to lease this land, it being, he contended, a public wharf, but the Court of Appeals held the lease to be valid and condemned Mr. Esplin to pay \$300 damages and costs.

Damage by Recent Gale was Extensive

A prominent Ottawa Valley lumberman, in a letter to the Canada Lumberman, referring to the recent losses by reason of the blowing down of much valuable timber in Northern Ontario during the heavy gales early in November, says:—"Reports I received here would indicate that 95 per cent. of the standing timber throughout the area covered by the Massey Lumber Company's holdings is down. From other information I have, it appears that the Massey Lumber Company are only one of a great number of lumber interests that suffered. The effect of the blow was carried to the Nipissing district and I understand that timber recently purchased at the government sale was badly affected. The government should take steps to clear up the slash at practically any cost, rather than let it be the cause of burning up all the balance of standing timber in that district. They should be urged to assist the lumbermen in every possible way to have this slash put in rivers and lakes before next spring. There is no use trying to do anything after next spring opens up, as the timber will be useless a year hence. I am not in a position to know what representations have been made to the government, but I am convinced that they will be making an awful mistake if they do not act promptly."

The Department of Lands, Forests and Mines of the Province of Ontario has sent instructions to its government rangers in the district effected by the storm, to make detailed reports upon the damage. Up-to-date the reports received are of a very general nature, but indicate that the loss has been extensive and that it was confined largely to the district between Thessalon and the mouth of the French River. The government reports corroborate stories already received of extensive damage on the limits of the Massey Lumber Company, but the damage is not estimated, according to government reports, as high as by other reports which have been published. The latest information received by the Department indicates that the damage in the Massey limits is between 50 and 70 per cent. of the total standing timber. Government reports also show that the storm was heavy in the township of McWilliams, the timber upon which was recently sold by tender to the Georgian Bay Lumber Company and Geo. Gordon & Company, Limited. These purchasers secured the right to cut red and white pine on the McWilliams limits for the payment of the amount of their tender and \$5 per thousand feet ground dues and \$10 per square mile ground rent. Under this arrangement the government will be a heavy loser unless the limits are cleared quickly of all the down timber, so that it can be manufactured before it deteriorates.

Government reports also state that quite a heavy loss was caused on the island of McGregor in Lake Huron. The down timber on McGregor island is being offered for sale by the government. As soon as detailed reports have been received of the damage in the other districts, the government will decide upon the best means of meeting the situation.

To Regulate River Driving Charges in Quebec

Montreal, December 6th.—The Hon. L. Taschereau, Minister of Public Works in the Quebec Government, has introduced a Bill respecting the toll to be charged for the logs and timber floated down rivers and water courses. It is proposed to give powers to the Running Waters Commission, of which Hon. S. N. Parent is chairman, to fix the amount of the tolls. On the first reading, Mr. Tellier suggested that the lumber companies should be held responsible for floods or damage caused by the breaking of dams, and Mr. Taschereau promised to consider the suggestion.

Demurrage Charges were Excessive

Montreal, December 6th;—The Quebec Public Utilities Commission, sitting at Quebec, have given judgment in the case of the Chicoutimi Pulp Company against the Quebec and Lake St. John Railway. The former complained that they were being charged \$3 per day for demurrage instead of \$2, which amount they considered excessive. The company on their part claimed that merchants and others neglected to take their goods from the cars within a legitimate time, consequently depriving the railway company of the use of the cars. The Commission held that the railway company were not justified in making the additional charge of the extra \$1.

Vancouver Timber Returns Show Increase

An official report issued by timber scaler Bryant for the Vancouver district shows that the timber trade has been more active in that district than it was during 1912. The amount of logs entering the port and being scaled at the mills in the district during the twelve months from December 1st, 1911, to November 30th, 1912, was 656,000,000 feet. For the twelve months from December 1st, 1912, until December 1st, 1913, a total amount of 673,000,000 feet of logs entered the mills and paid dues. This shows an increase of 17,000,000 feet in the amount of logs handled by the mills of the Vancouver district this year.

The Value of the Tree Faller

By H. D. Langille

Efficiency is the greatest requirement of our complex, modern industrial life. It is sought for by the foremost men in every vocation; it spells the difference between success and failure; it enables one man to climb the grade while another exhausts himself at the foot of the hill; it makes the difference between men and their accomplishments; it is what most of us generally term luck. In a narrower sense it means a minimum of expenditure and a maximum of production. The expenditure may be in dollars of cost or brains or strength or raw material going into the effort to produce; but who is there among us to-day who can say that in his business the last word in efficiency has been written. Certainly none engaged in logging can say it.

Three-fold Saving Effectuated

We are using a device to assist in converting trees into logs with a saving, first, of the physical strength and time of your men; second, of a larger part of the raw material representing your investment; and third, cheaper delivery of logs from stump to car.

This device is known as a "tree faller" or "jack." Its purpose is to enable timber fallers to throw trees in any direction desired without regard for the angle or degree of the tree's "list" or "lean."

It is not an experiment. Its practicability has been tested and proven under the most severe tests to which any reasonable men would subject it. Two tree fallers of the original design and material have been in use for several weeks in one of the camps on the lower Columbia, and even that inferior type has given complete satisfaction. The new design is much superior in every way. Its success and its value to those operating in large timber is assured.

Device Involves Lever Principle

The device embodies only the simple old principles of arms working on a fulcrum and spread through the agency of a slow-moving screw operated with a hand lever. Its lifting power is enormous. I am unable to tell you how much in pounds because as yet we have not tested it scientifically with mechanical appliances, but we have tested it thoroughly in practical use. A few days ago I witnessed a test made with this faller. We selected a Douglas fir five feet in diameter and 260 feet in height above the ground. This tree stood on the point of a ridge and it leaned down the hill 23 feet 9 inches by actual measurement with a transit. The experienced fallers who cut it agreed that not more than three logs could have been saved had it been necessary to cut the tree in the usual way. We lifted this enormous weight against its lean and felled it in exactly the opposite direction along the crest of the ridge, saving, without a break, seven 32-foot logs, or 224 feet of merchantable length, or all there was in the tree. The top broke at 10-inch diameter. Assuming that the three butt logs could have been saved under the old method of cutting, the saving in log value from this one tree alone by the use of the jack was \$45 at the present low price of logs.

At another camp a magnificent spruce containing 20,000 feet of logs was left by the loggers because had it been felled across the deep narrow gulch over which it leaned, its destruction would have been complete and there would have been nothing but additional litter on the ground. With one of these jacks the tree was lifted against its lean and laid up the hill without a break under 200 feet from the stump. These are merely examples of what has been done. The lifting power of the device is limited only by the compression strength of wood, hence anything not outside the bounds of reason can be accomplished by using two jacks in order to secure a greater compression surface.

The weight of this form, complete is 122 pounds. The jaw opens 7 inches, hence the jack is capable of throwing trees of almost any size. This type is adapted to use in the heaviest Douglas fir, spruce and redwood forests where, by using two jacks, trees of any size may be thrown in any desired direction. We now propose to make a lighter form for general use in smaller timber. This will weigh about eighty pounds complete and possess the same strength as this form, but it will not have the same spread. Later we may design a still lighter type for use in place of wedges in ordinary timber felling. The device is made of the best grades of steel by the drop-forge process, instead of by casting.

Increases Efficiency of Falling Crews

It will be easily seen that not all of the value of this device lies in saving timber, although this feature alone demands its use. The efficiency of falling crews is greatly increased. Instead of spending hours in almost fruitless, exhausting effort to throw trees with wedges, the saw is kept free at all times, thereby increasing the capacity of a crew 35 per cent., according to experienced fallers who have used the device. Nor is this all. Every logger who has worked in big timber knows not only of the enormous loss of good values through breakage, but also of the added cost of yarding where the ground is strewn with broken logs and debris. With every tree taken out in

its entirety, the work of the book tender is made easier and consequently the efficiency of the entire donkey crew is increased.

These are the prime merits possessed by this device. You will discover others if you put it into use. It is one of the greatest factors in true conservation ever added to the equipment of logging camps. It means the saving of billions of feet of timber in this country of big trees; it means the saving of hundreds of thousands of horse power in human strength; it means easier work and therefore greater contentment among those who toil in the woods; it means greater yields of timber per day and acre and therefore greater profits to the operator; it means a "minimum of expenditure and a maximum of production"—which is efficiency. More than these cannot be asked of one simple device.

Latest Devices For Forest Protection

By E. T. Allen

A truth less realized in America than in older countries is that forest industry is in the final analysis an entity. Man needs wood in various forms. To make the earth supply it, adding such labor as is required to make it available and suitable for his use, is a business. Convenience may require that it be conducted by one unit of management, as when the small mill cuts its own timber and retails to local consumers; or by several, as when timber, logging, manufacturing, jobbing, transporting and retailing are each under separate proprietorship. But although the latter system may produce some conflict of interest between its units, it cannot possibly destroy the greater mutual interest of all branches of one business. In the long run the prosperity of all has a common basis and this must include perpetuation of the resource dealt with, economy in every process and just payment by the consumer for the services rendered.

Everyone of these three things involves more than is under the individual control of any unit. It involves the influence of the other units and of the public. Consequently loggers should be interested not only in the economies of their own processes, but also in the progress of forest protection and its incidental work of public education in many things that affect the industry as a whole. And while latest devices for fire fighting are of great interest, I believe there is quite as much real development by protective agencies along other lines, and that there is perhaps even more need for us all to understand its trend and object.

The co-operative patrol movement in the Pacific Northwest has had phenomenal growth. It is only about seven years since the first protective association was formed by a few lumber owners in the Coeur d'Alene district. Their plan did not go beyond cheapening and improving a local fire patrol. Now there is a chain of similar associations from the Montana Rockies to Northern California, patrolling over twenty million acres, employing many hundred trained men, and spending hundreds of thousands a year. They protect about five hundred billion feet of timber, or a fifth of the nation's supply, and keep the loss down to so negligible a figure that it can hardly be expressed in terms of percentage.

Co-operative patrol has proved so successful that even in these few years it has established a wholly new channel for the direction of public forest protection policies, state and federal. Once almost regarded as disciplinary and directed at lumbermen, necessarily originated and executed without consulting their interest, forest legislation is now mainly along the lines of strengthening a team relation between lumbermen and official agencies, one which shall utilize private interest and competence to the utmost. The associations have legalized official standing as representatives of the state or government. Whereas at one time the effort was to collect from forest owners funds to be expended by public officials, it is now rather to discover ways in which private protective systems can serve as the most efficient agencies for public expenditure. They are also consulted as to punitive laws and constituted a constabulary to enforce them.

I sometimes wonder whether the true significance of this change is realized. It means that those Coeur d'Alene men unwittingly discovered a gate through which forest industry is passing the barrier of public misunderstanding and distrust to take its rightful place in the community as a useful and commendable industry. Certainly it has not its rightful place until its voice is welcomed and respected in all men's councils that affect its welfare. To have such a voice in strictly protective affairs is not so old or trifling a thing that we should accept it without gratification. It is infinitely more important that it is also the voice of all forest industry, earning an influence in all affairs that affect the lumberman, whether the making and enforcing of laws or of that which is greater than law—public sentiment.

When the extending and improvement of co-operative patrol became of recognized importance, the pioneer associations allied in the Western Forestry & Conservation Association to maintain facilities for this purpose and also for carrying on a campaign of public education in the fire evil, so there might be fewer fires to find and fight. To some of you, perhaps, it still symbolizes these things only. You

know only of its forest fire conferences and its precautionary material that reaches the reading public. To such, before passing to devices for fire prevention, I want to speak of the system by which our organization assists you in these other things I have suggested.

The truth is that the work of the central association is now chiefly along these other lines. Its part in developing local fire work is practically accomplished. Of twenty-five local associations on the Coast, seventeen in Oregon alone, only the original five in Idaho and Washington do not owe their existence to its organizing influence. To a large extent it shaped the laws and appropriations under which they work. It has facilitated their exchange of methods to increase efficiency and by its educational work done much to prevent carelessness with fire from overtaxing methods and funds. And it still contributes perhaps as much as ever in most of those directions. Yet in the nature of things it must do so with less proportionate title to credit and more anonymously. It would fail did it not build up independent efficiency among the locals and, obviously, since it is they who must maintain membership and make assessments, it must let them utilize to the fullest every opportunity to point to success in local matters outside of their fire work, even if the central association is really the prime mover.

Consequently the Western Forestry & Conservation Association is more and more assuming the less spectacular but no less necessary functions which for similar expedient reasons the locals can not perform. It has been the chief promoter of reciprocal relations between association, state and federal protective agencies, not only locally but in such matters as securing large sums for Northwestern states under the federal Weeks law. It represents Western forest interest in all national affairs. It conducts studies of forest taxation. It sees that the progressiveness of the Pacific forest owner and the safety of the Pacific timber are known all over the United States, doing so by personal representation, by skillful publicity, and by exhibits at numerous Eastern expositions. Inquiries as to methods come from as far as Russia and Tasmania. It keeps in touch with similar forest owners' organizations in the lake states, the East and Canada, and through newspapers, magazines, conventions, clubs, commissions and public boards, it utilizes every opportunity to reach our local Northwestern public.

In short, no matter what or where the tendency or the crisis, Western forest industry is assured representation which is not suspected of ulterior motive but welcomed because it is kept scrupulously free from any but mutual private and public interest. And throughout it teaches this true principle—that not forests but forest industry is what America really seeks to perpetuate; that there is no object in growing or preserving forests without at the same time affording justice and stability to the industry that alone can make them useful; and that it is one great industry which cannot suffer undeserved injury in any branch without injuring all and eventually the public.

Fire Prevention in Logging Operations

Returning now to fire prevention in the woods and around our camps. Never in history has there been such rapid advance in technical methods as since our state, federal and private fire fighters have attacked the problem jointly with full knowledge of each other's inventions and a friendly spirit of rivalry. Co-operation has removed the tendency to regard each other as impractical and consequently to disregard differing theories.

In reviewing progress during the past year perhaps the most notable innovation is the Oregon compulsory patrol law, enacted last winter. Every timber owner must maintain a patrol as good as do 51 per cent. of his neighbors, or the state may do the work and collect a maximum of 5 cents an acre in the same manner that taxes are collected. The state forester has platted the entire private ownership of the state and of those not already doing good work requires that they install patrol or join an association. He encourages the latter course. There has been surprisingly little objection to the law and so far no necessity of state action. Although to learn ownership and get things going has taken much of the season, about three thousand owners are now paying into the associations for the first time. The state also contributes to these associations.

It was a comparatively easy season, judged by modern standards, for losses were negligible—probably the least in Northwestern history. We must not forget, however, that this was not all due to the weather. In old days, as much dry, windy weather as we had this year always did much damage for there were countless smouldering fires for it to fan up, and no machinery for jumping on them. It means that protection is so good now that we don't have to worry except in a very bad year. But the bad year will come and there is none the less need for constantly strengthening our defence to meet it. A good year gives just the chances needed for perfecting details we cannot touch when overworked.

Consequently this season has seen much progress in telephone and trail building and particularly in equipping lookout stations. There is increasing use of men for this purpose only, with facilities for

taking and communicating cross-bearings on fires so that other men can be sent to the exact spot without delay. Some of the results have been remarkable, locating a distant fire on the exact forty. This work is done by use of good maps and carefully-oriented protractor dials; much as courses are laid on a ship's chart. Portable telephones are found useful by mounted patrolmen, but there is no less need for permanent lines, and these are being better built than before. The Forest Service in particular is also doing much experimenting with specially weather and bullet-proof instruments.

Portable wireless is not yet in use with us, but its portable value as an auxiliary to trunk telephone systems, especially in rough country or at large fires, is causing considerable experiment and next year is likely to see field tests.

Among experiments with tools, one likely to interest loggers is a gasoline fire engine built by the Forest Service for use around camps or elsewhere that water is obtainable. Costing but \$200, it is said to deliver 25 gallons a minute through 1000 feet of 2-inch hose with a 150-foot rise.

Forecasting Weather Dangers

We have all long known that our greatest fire danger lies in the hot dry interior wind known all over the Pacific Coast under different names. It is a "Chinook" in Spring or Winter; in Summer the "east wind" of the Cascade region, the "norther" of California, and east of the Columbia basin is likely to be deflected eastward up the Idaho mountains. It has caused most of our disastrous sweeping fires and, as our facilities for handling ordinary conditions are becoming adequate, constitutes our great future hazard. A city fire department may seem perfect, but an earthquake may burn a San Francisco, and no forest region subject to a wind like this is wholly immune from a Hinckley, Gaudette, or Coeur d'Alene forest fire calamity.

The Weather Bureau, the Forest Service and the Western Forestry & Conservation Association have just inaugurated a study of the possibility of accurately forecasting this wind and distributing the information to loggers and protective agencies so that if conditions warrant camps can be shut down, burning delayed or other precautions taken. Generally speaking, it should be simpler than most weather predicting, for the conditions producing the wind are interior, not at sea, and can be observed. They consist of a high pressure area in upper British Columbia or Alberta coincident with a low pressure area in the California region, causing the flow from one to the other of a violent interior air current which carries no moisture and is consequently exceedingly drying.

Theoretically, all that is necessary to forecast this is promptly reported barometrical readings from both regions and we have taken steps to secure the co-operation of the American and Canadian weather officials in this respect. Practically, there may be difficulty in getting proper reports from the sparsely-settled portion of the northern area and also in calculating local exceptions to the general current. Certain parts of our territory are affected by such a wind under general and determinable conditions, but others may have the general wind diverted by other pressure areas or be subject to dry winds caused wholly by the latter. Until these questions have been further studied it is hardly wise to attempt systematic forecasts, for mistakes in the beginning would brand the project as impractical and only annoying. But we hope that by next season something will come of the investigations being made by District Forecaster Beals, in charge of the Portland Weather Bureau office, who has been authorized to work it out if possible. I may say here that some of the Idaho patrol associations are also experimenting with local barometer readings.

This was not as good a season as hoped for slash burning but a great deal has been done, experience has been gained, and belief in its advisability strengthened. There has been a marked tendency to tighten up on Summer burning and burning without permit. We are realizing that the slashing is our greatest menace. There has never been a year in which slashing fires were checked so quickly and watched so carefully until rainfall. There has been quite wide adoption of camp fire rules, specifying in print the responsibility of all employees and emphasizing that preventing fires comes before getting out logs. The experiment will probably result in improved rules next year.

If there is anything needed in the average camp, especially now that the woods are full of patrolmen, it is a clear understanding of the foreman's responsibility for fire. He cannot be blamed if, considering getting out logs the work upon which he is judged, he is reluctant to let anything interfere with it. His duty when this involves fire risk, both individually and in relation to the demands of fire wardens, should be most clearly laid down by his employer. Given such an understanding he often has the best possible judgment in the premises, but not always. Sometimes he does not know as much about fire risk as a specially-trained fire warden. Whichever the case, the responsibility should be fixed in advance.

I do not think the time far distant when every logging camp will have a fire plan, as specific as the safety equipment and drills aboard ship, including, not only every safeguarding appliance and the movements of the men in case of fire, but also precautionary planning of all

operations. We do this with a mill. It is far more important with the material that supports the whole industry.

The protective branch of forest industry is no longer merely the patrol of mountain slopes by the owner. While he is reducing that end of it to a science, protection is in the nature of things being forced to serve more and more as the interpreter between all forest industry and the public, and to remove every hazard for which the industry itself may be held responsible. It must deal more and more with the logger and needs not only his support, but also his technical thought and advice. We are all in one business and it pays to safeguard it. It is also more or less the public's business, and if we don't protect the public it may take a hand in ways to make us regretful. The more sincerity and ingenuity we all devote to forest protection, in field and camp, the sooner will lumbermen as a class reach a position where their voice will be welcomed as that, not of greedy acquirers and destroyers of trees, but of most useful servants of the commonwealth, deserving its reward for fostering and furnishing one of life's essentials.

Problems of Douglas Fir Distillation

By George M. Hunt

Every one now realizes to some extent the enormous economic losses to the country resulting from the waste in logging and lumbering operations. People have ceased to wonder now at the number of cords of wood consumed annually by the waste burners, but they are very much interested in the question, "What is to be done about it?" Much time and money have been spent in efforts to answer the question and there have been many suggestions, good, bad and indifferent. Some of them have been nothing more than the dreams of enthusiasts, or even wildcat promotion schemes. Others based on more careful observations have had some degree of merit.

More attempts have been made to utilize the waste by distillation than by any other process, and, although every one of those attempts has failed, interest in the subject does not seem to grow less. In spite of the popular interest, however, there has been very little definite knowledge and many misleading statements have been made.

To overcome this lack of knowledge and furnish a safe basis for future calculations, a series of experiments were undertaken by the forest service, in co-operation with the University of Washington, and are now nearing completion. The primary object of the experiments has been to determine the yields of the principal crude products. Obviously this is the most important part of the whole problem, since the study of refining processes, and other detailed studies will only be justified in case the yields of raw products are found sufficient to make commercial operations feasible. The experiments have been carried out on a much larger scale than the usual laboratory experiments, and several have been actual runs at commercial plants.

The problem of utilizing stump wood is entirely different from that of utilizing mill waste, so both classes of materials were included in the experiments. Much has been written about the possibility of wood distillation as an aid to land clearing. In Michigan it has been found profitable to distill the stumps of Norway pine, and there are at present several plants utilizing this material. If the distillation of Douglas fir stumps could be made to bear a part of the cost of land clearing, it would be a material help in changing into farms the logged-off lands of the Northwest and British Columbia.

Prior to the present series of experiments some work had been done by the United States Bureau of Plant Industry and the University of Washington. They first attempted to develop a cheap portable plant of such simple construction that it could be operated by ordinary farm labor without technical supervision. The experiment was unsuccessful, however, since the plant would not stand the work. Another portable plant was tried with somewhat better success with regard to its operation, but the results did not prove to be of much value. Some other minor experiments were also carried out, but did not produce any important results.

Experiments on a Commercial Scale

We now come to four experiments on a commercial scale, two of them under the Bureau of Plant Industry co-operation, and two under the forest service. Each test differed more or less from the others, and they were carried out at three different plants. The processes employed were steam distillation with and without subsequent extraction, destructive distillation, and combined steam and destructive distillation. I will first describe the separate experiments, and afterwards give a summary of the yields.

The first of these tests was made at the plant at Anacortes, Washington, by steam distillation under pressure. The steam was then turned off and a vacuum applied. The only product obtained by this process is crude turpentine. Although the rosin was not extracted from the chips, the amount was estimated by later extracting small samples with alcohol and naphtha.

The next test was made at the plant of the Oregon Wood Distilling Company, at Linnton, Oregon, using the combined steam and

destructive process. About 29,000 pounds of stump wood were obtained in the vicinity of Vancouver, Washington. It was split and sawed into blocks approximately 4 x 4 x 6 inches and loaded into the retorts by means of a conveyor. Two vertical retorts were used, of four cords capacity each. The wood was first distilled six hours with steam, which was then turned off and direct heat applied for 26 hours. The crude turpentine resulting from the steam distillation was collected apart from the products of the destructive distillation, but unfortunately it was contaminated by the tarry matter remaining in the condenser from the previous run. The products obtained in this test were crude steam, turpentine, light oil, pyroligneous acid, crude alcohol, tar and charcoal.

The third commercial test was made by the Yaryan extraction process at the plant of the Cadillac Turpentine Company of Cadillac, Michigan. A carload of stumps was shipped to the plant from Washington and 38,000 pounds of the material used in the run. The stumps were first cut into irregular sized blocks with a circular saw, then thrown into a sixty inch hog, from which the chips went to a shredder. The finely ground material from the shredder was loaded into four large extractors. In the extractors the material was distilled for one hour with steam at eight or nine pounds pressure. The steaming was much more thorough than is usually given to the Norway pine on which the company operates. After the steaming, a vacuum of twenty-five inches was maintained for thirty minutes to remove as much moisture as possible from the charge. The steamed wood was then extracted with a hot solvent for a short time, to remove the rosin. The rosin is usually recovered from the solvent by distillation, but in this case there was apparently so little rosin in the solvent it was not recovered. The amount present was determined by analyzing a sample of the solvent. The products obtained from this run were crude steam, turpentine and rosin.

The last commercial test was made at the Oregon plant. This time the wood was not steamed, destructive distillation alone being employed. Two charges of wood, weighing respectively 27,000 pounds, were distilled. The stump wood for the first charge was obtained from Scappoose, Oregon, and that for the second charge from the campus of the University of Washington. The wood was cut into small blocks and loaded into the retorts as in the previous run at this plant. The retorts were fired for 24 to 48 hours. The distillate was collected in a large tank and later re-distilled, to separate it into the four products, light oil, crude alcohol, pyroligneous acid and tar. These, with the charcoal, constitute the five crude products obtained by the process.

Results of the Experiments

Now for a summary of the results of the four experiments. Throughout all these experiments 3,800 pounds of wood is considered a cord.

Steam and extraction process. The best yield by steam distillation, 4.1 gallons of good turpentine per cord was obtained at Anacortes, Washington. At Cadillac and at Linnton less than one gallon of good turpentine per cord was obtained. The estimated yield of rosin at Anacortes was 150 pounds per cord, and at Cadillac 75 pounds. The stumps distilled at Anacortes were above the average in richness. This was due largely to the fact that the outside wood had decayed away, leaving the more resinous part of the wood, which is more resistant to decay. But even if we take the exceptionally high results of the Anacortes run, the yield is still less than one-half that obtained from the Norway pine stumps of Michigan, which average about ten gallons of water, white turpentine, and 300 pounds of rosin per cord. Furthermore, it is more difficult to make a good product from crude Douglas fir rosin than from that obtained at the Eastern plants.

Destructive distillation process. The average yields per cord obtained by destructive distillation on the recent two run test at Linnton were as follows:

100 per cent. wood alcohol, gallons	2.3
Turpentine, gallons	1.6
Other oils, gallons	3.8
Tar, gallons	15.3
80 per cent. acetate of lime, pounds	62.9
Charcoal, pounds	800

These yields are somewhat higher than those of the combined steam and destructive test at the same plant. It is difficult to make a fair comparison of these yields from Douglas fir stumps, and the yields obtained from Norway pine and longleaf pine. At one plant in Michigan, Norway pine stumps yield from eight to eighteen gallons of refined turpentine, and from ten to twenty gallons of tar per cord. At a plant in the South using longleaf pine, the yield per cord is ten to twenty gallons of refined turpentine, seven to sixteen gallons of other oils, and twenty-five to forty-five gallons of tar. No attempt is made at either place to save the acid and alcohol. The wood used in both places is more or less selected, as is the case in most plants using stump wood. Although no exact comparison can be made, the figures show that the yields of tar and oils to be obtained from Douglas fir stumps are far less than those obtained from Norway and

longleaf pine stumps. The yield of charcoal is about the same in each case, while the yields of acid and alcohol cannot be compared, but those from Douglas fir are so low that it is very doubtful if these products could be profitably saved.

These commercial tests and other supplementary investigations force the conclusion that under the present market conditions the distillation of Douglas fir stumps as an aid to land clearing is entirely out of the question for the following reasons:

1. The yields of raw products are too low.
2. The products are different from those of the Norway and longleaf pines, and their uses and value have not been fully established.
3. The stumps are much larger than those of the two pines, and the expense of handling them is greater.
4. The distillation of stumps would be illogical in view of the fact that there are such enormous amounts of mill waste being produced which can be obtained and handled very much more cheaply. By selecting the richest of the mill waste it is possible to get a material giving better yields than stump wood. Even if the distillation of stumps could be made to pay, mill waste distillation would pay more, and the mill waste would drive out the stumps as a raw material.

Mill waste study. Upon the completion of the stump wood study, the mill waste study was taken up. An experimental distillation plant was erected on the campus of the University of Washington, at a cost of about \$2,500. The plant has a capacity of about three-eighths of a cord, and its design is rather out of the ordinary. The wood, cut in two-foot lengths, is piled into three iron cars, which are run into the retort on a track. The heat is not applied directly to the shell of the retort, but is furnished by four five-inch flues, which run from the furnace, along the inside walls of the retort and return to discharge into the stack. The whole of the retort is covered with a two-inch coat of insulation. Without the insulation the heat would radiate so rapidly that it would be very hard to get a sufficient temperature in the retort, but with its protection, the temperature can be raised much higher than necessary. The gases resulting from the distillation pass out through an opening in the bottom of the retort, at one end. The retort slopes slightly towards this end so that the tar drains out through the same opening. It is customary to have the vapor outlet at the top of a retort, but the bottom outlet has several advantages.

Upon leaving the retort, the gases and tar pass into the tar separator, which is simply a large iron cylinder. In the tar separator the tar condenses out of the lighter gases, and remains behind with the tar which has drained out of the retort. There is a steam coil in the separator which keeps the temperature so high that everything but the tar passes on into the condenser. Here everything is condensed except the non-condensable gases, which pass on through a fan and two back fire traps, into the furnace.

The distillate flowing from the condenser is collected in a receiving tub. After the run is finished this liquor is re-distilled in a small copper still. This operation separates it into three products, namely, pyroligneous acid, light oil and still tar. The pyroligneous acid contains about three per cent. of acid, principally acetic, and 1 to 1½ per cent. of wood alcohol. The light oil contains turpentine, and other oils, some heavier and some lighter than turpentine. The tar is about three per cent. acid. Samples of these products are taken to the laboratory for analysis. The wood is weighed and measured before it goes into the retort, and the charcoal weighed as soon as it is removed.

The plant has been operating continuously since early in June, and up to the present practically no trouble has been experienced.

The mill waste for the experiments was obtained from four different sections of the state, and the average results will furnish a fairer basis for calculation than if the wood were all from the same district.

No definite statement can yet be made of the yields from unselected mill waste, because the work is not yet complete, and the data on hand have not yet been properly analyzed. In a general way, however, it can be said that the yields are for the most part practically the same magnitude as those from stump wood. In commercial practice the yields would be higher because the waste would be selected for richness.

The work has proceeded far enough, however, to show that the distillation of Douglas fir offers nothing very tempting to possible investors. If the industry is ever made a paying one, it will not be until after a great deal of expensive engineering has been done and many difficulties overcome. The chief difficulty will be to market the products. There is at present a well founded prejudice against the oils and tars from Douglas fir. These products would have to be put on the market in a less objectionable form than has been the case in the past. This will necessitate new refining methods.

The products from a single twenty-cord plant would probably be more than enough to supply the present requirements of the whole Pacific Coast, even if all the Eastern products could be driven out of the market. It would, therefore, be necessary to find new uses for the products, or establish more of the industries which can now use them.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

A New Design in Tenoners

The tenoner illustrated herewith is a new design recently produced by the Canada Machinery Corporation. Many features have been embodied in it which facilitate quick and easy operation.

The carriage is provided with combination roller movement, making it very easy to push the table and stock past the cutter heads. Two stop gauges are provided in longitudinal slots on the face of the table. The stops are so designed that they can be depressed below the surface of the table, thus admitting of the two being set at once, one for the end of the board and the other for tenon already cut.

A fence is provided on the table which can be angled in either direction, and the hold down is arranged to hold the stock securely, regardless of the angle at which the fence is set. Stationary feed instop is provided on a bracket attached to the base for regulating the depth of the tenon on the first end.

The heads are of our new pattern, carefully balanced to insure satisfactory operation at high speed. The spindles revolve in special babbitted bearings of improved design. These bearings are of the side clamped reservoir type, easily aligned and adjusted. The heads are raised and lowered by means of square thread screws on planed "V" ways, to which they are carefully gibbed.

A unique feature of this machine is, that, while the heads can be raised and lowered independently they can be, if so desired, moved together without changing the thickness of the tenon.

A shaving hood arranged for attachment to suction pipe is supplied on the top head. The belt tightener is a simple device operated by means of a weight, and automatically keeps the necessary tension of the driving belt, regardless of the adjustment of the heads.

The cope heads are adjusted with their respective tenon heads, and also have independent, horizontal, and vertical adjustment. The cope arm is cast in one piece and is fastened to the frame on two separate bearings, giving a very rigid construction. It is exceptionally long to give ample length of belt from the pulleys on the cope head spindles to the driving head.

Provision has been made in the design for attachment of a cut-off saw. When this is supplied it is bolted on the rear of the column, and is driven by an open belt from the bottom pulley shaft.

The machine can be furnished without copes, with single cope, or with double copes, as desired.

The cut-off saw can be supplied with any of the above arrangements.

While the Canada Machinery Corporation have had this machine on the market for a very limited time, over twenty are in daily operation in various woodworking plants in Canada, and the machine generally has been endorsed by experienced woodworkers.

504 Tenoner with Double Copes manufactured by Canada Machinery Corporation

Larger Quarters for the Can. H. W. Johns-Manville Co., Ltd.

The Toronto branch of the Canadian H. W. Johns-Manville Company, Limited, announces its removal to more spacious quarters at No. 19 Front Street East. This new store and warehouse has a floor area of approximately 35,000 square feet and is situated in the heart of the wholesale district. In their new quarters this firm will be able to carry a larger stock and will have ample space for the display of their complete line of J-M Asbestos roofing, packings, pipe coverings, building materials, electrical and railroad supplies, automobile and plumbing specialties, etc. The entire building will be lighted by their well-known Frink and J-M Linolite system and one room will be used for exhibiting these systems of lighting.

Useful Dixon Booklets

Engineers who keep a file of books for reference will be interested to know that the Joseph Dixon Crucible Company, Jersey City, N.J., still have a limited number of booklets dealing with such subjects as "Steam Traps," "Unions for Steam Pipes," "Feeding Graphite for Lubricating Purposes," etc., which will be sent free as long as the supply lasts, to anyone who cares for them. These treatises were prepared by the well-known engineer, Mr. W. H. Wakeman who has written many articles on practical engineering problems. Numerous illustrations are used to make each subject easily understood. These booklets were printed some time ago, but are just as desirable as ever.

Manufacture of Electric Welded Chain in Canada

By L. B. Powell*

Electric-Welded Chain in stock.

In order that the vast improvement which has taken place in the chain industry of this country during the past few years may be more clearly understood the following brief description of the way chain was formerly made under the old style fire welded process, is of importance.

The equipment of a chain plant for operating under that process consists principally of coiling machines, cutting machines, forges and hand or power hammers. The material was coiled into a long spiral and cut into separate links under a cutting press, the spiral being fed into the press in such a way that each link was cut across with a scarf at an angle of about 45 degrees. These links were taken to the chain makers and brought to a welding heat in either a combination gas and hand furnace or in a coke forge. A number of links would be heated at the same time and, as fast as one would come to a welding heat, it would be taken from the fire and the scarfed ends pounded down under the blows of a hand or a power hammer.

This method of manufacture was very unsatisfactory as the quality of chain depended entirely upon the fidelity and skill of the workman, who was usually paid a piece-work price that made it necessary for him to weld a very large number of links per day. Owing to the rapidity of action required, there would always be a large percentage

*Sales Manager of the McKinnon Chain Company, St. Catharines, Ont.

Electric-Welded Chain—showing swell-weld.

of links that would be either heated too much and thus burnt, or not heated enough so that a perfect weld could not be made. In addition to this, there was always the possibility of dirt from the fuel getting between the scarfs of the links, thus preventing a perfect junction of the metal.

The electric welding of chain is a modern improvement, made necessary by the evils existing under the old style of manufacture. Chain above all other products needs the strength that is obtainable only by perfection of welding, and the invention of the automatic welding process is the result of experiments continuing over a long period of time, with a view to finding a method of forming and welding links that would result in every weld being absolutely perfect.

The machines illustrated herewith are not the product of a chance thought but are the result of long study and expensive experiments resulting in continuous improvements, all of which are fully protected by patents in Canada, Great Britain, United States, and several European countries.

The plant of the McKinnon Chain Company, located at St. Catharines, Ontario, is of modern fireproof construction throughout, and is thoroughly lighted and ventilated. It is filled with expensive automatic machinery capable of turning out a very heavy tonnage of chain.

Chain from forming machine ready for welding.

Tests show breaks at points other than the weld.

The company has a similar plant at Buffalo, N.Y., for its United States business.

The first operation in the manufacture of Butt Weld Chain is forming the chain into unwelded links on the forming machine shown in one of the illustrations. The coils of wire are fed into the machine from a spool and the operation of the machine is entirely automatic, linking the chain together ready for welding as shown.

From the forming machine the unwelded chain is fed directly into welders of the type illustrated, the operation of which is entirely automatic.

Owing to the fact that alternate links present themselves for welding with the opening at different angles, these welders are constructed with two heads so that the first head will weld every other link and the second head will weld those in between, the chain being twisted between the first and second heads so that the link will be presented to the jaws of the welder in the same position. This arrangement is one of the patented features of these machines.

The electrodes of the welder meet the material on each side of the joint, and, while the current is passing across the joint the link is being given compression at the ends so that a junction of the material at the welding heat is being effected. The heat is developed by the passing of a large volume of current at a very low pressure (2 to 3 volts). The pressure is so low that the current cannot be felt even with both hands on the electrodes, while the volume is so great that $\frac{1}{2}$ -inch links come to a welding heat in five seconds and it requires a conductor or lead 8 inches square of pure copper. A curious fact about copper used for such purposes is that one per cent. of impurity reduces its current carrying capacity by thirty-three per cent.

These welders are entirely automatic, with the pressure and current regulated so that each link receives exactly the correct amount to insure a perfect weld. This does away with the uncertainty of fire welding where the perfection of the weld is subject to the chances of want of skill or care on the part of the workman—burning or insufficiently heating the steel—and of dirt or sulphur in the fuel.

One of the accompanying illustrations shows several sizes of chain just as they come from the welder and illustrates clearly the swell at the weld which is a feature of all of McKinnon products. This swell is a natural result of the process of manufacture and while it could be reduced so that the weld would be equal in diameter to the balance of the link, such a reduction would not only take away the extra strength where most needed, but would have a tendency to weaken the weld mechanically, and in both these ways would reduce the quality of the product.

The swell at the weld does not interfere in any way with the use of the chain for practically all purposes and a great many tests have proven absolutely that the reduction of the weld would mean a decrease of almost fifty per cent. in the strength and wearing quality of the chain.

While records show that over 99 per cent. of the products of these automatic welders is perfect in quality of welding, yet nothing is omitted that will produce as near to 100 per cent. perfection as possible. For that reason every link of chain is carefully inspected after it leaves the welder and any links that may show evidence of imperfect welding are at once cut out and the chain is passed to the hand welder to be joined together before being tested.

In 1909 it was considered advisable to make some public tests of McKinnon Electric Weld Chain in competition with other makes and for that purpose samples of chain were taken from the stock of a large

Montreal jobber, of McKinnon Electric Weld and fire-weld chain of American manufacturers in "Proof Coil" and "3B" quality.

It may be stated here that fire-weld chain is divided into several different grades, partly according to the length of the link and partly according to the assumed quality of the product. "Proof Coil" is the cheapest quality made, next comes "BB" quality, next comes "3B" quality and the highest grade is known under the various names of "Crane," "Dredge," or "Loading Chain," according to the use to which it is to be put. Each grade of chain calls for a link that is still shorter than the next cheaper grade and on account of this variation in the length of link, the cost and selling price increases, as, the shorter the link the more welds there are to 100 pounds and the more the chain maker was paid for making the chain.

The piece-work price for different grades of fire weld chain also increases per 100 pounds so that the chain maker can work slower and be sure of more perfect welds than are expected in cheaper grades. This is one great advantage that the automatic electric weld chain has over all other makes, because the pressure and current being regulated automatically nothing is left to chance or to the skill of the workman.

In order to prove to the trade that McKinnon Electric Weld Chain was superior to the high priced products of fire weld makers, a number of tests were conducted at McGill University, the result of which is given herewith. In every case it will be noted that the yielding point and breaking strength of the electric weld chain is superior to that of "3B" quality of fire weld chain. The tests illustrated are proofs that the weld of McKinnon Chain instead of being a point of weakness is really the strongest point of the link as the chain invariably breaks when the tensile strength of the material has been reached, and at some point other than the weld.

The McKinnon Chain Company state that McKinnon Electric Weld Chain is the only weld chain being made in Canada and during the five years that the product has been on the market it has come into almost universal use among the leading manufacturers and users of chain throughout the country.

Graton & Knight Open Montreal Branch

Owing to the increased demand in Canada for their products, the Graton & Knight Manufacturing Company, Worcester, Mass., U.S.A., makers of Neptune and Spartan Waterproof Leather Belting, have established a branch in the Unity Building, 46 St. Alexander Street, Montreal, where they carry a complete stock of leather belting and lace leather.

They have also installed in these premises a 36-in. and 40-in. belt press, with other necessary machinery to build and repair large or small belts. It has always been the policy of this company to maintain competent repair departments in connection with its various branches, and the one connected with the Montreal branch is amply equipped to give prompt and efficient service.

The advertising of the Graton & Knight Manufacturing Company in Canadian trade papers has been along the lines of water and steam-proof leather belting. It is a valuable asset to the manufacturers in Canada to know of the exceptionally good qualities of their Neptune and Spartan brands.

The Bureau of Forestry of the Philippine Islands will send tropical timbers to the United States Forest Service so that their suitability for fine furniture veneers may be ascertained.

Comparative Cost of Wood, Coal and Oil for Fuel

By H. W. Sessoms

If you question loggers regarding the cost of wood for donkey fuel the majority of them will tell you that logs used for that purpose have no commercial value. My observation in our camp and in other camps that I have visited, where they are not operating in old growth, defective timber convinces me that wood is more expensive than either coal or oil.

About four years ago while operating in sapling timber, we scaled the logs used for fuel from time to time and found the average to be about 1,000 feet per day per donkey; the crew could put these logs on the car quicker than they could put them behind the donkey for the wood cutter. The cost as we figured it is as follows:

Value of logs, 1,000 feet on car	\$8.00
Wood cutter's wages	2.75

Total cost per day \$10.75

We then changed our grates and used coal and found the cost per donkey to be as follows:

1½ tons coal at \$4.25, delivered	\$6.38
---	--------

After using coal about two years we found that while coal had a decided advantage over wood in cost it did not decrease the fire risk, so we equipped one donkey and one locomotive for burning oil and after trying it out for thirty days we equipped our entire outfit with oil burners and find the average cost as follows:

Donkey, 6 barrels of oil per day \$1.10	\$6.60
---	--------

A great many people will tell you that donkey or other boilers that are not equipped with submerged heads will not stand oil fuel and I will admit that during the first six months we had considerable flue trouble; by that time we had learned that there were two causes for this trouble.

Difficulties Encountered in Oil Burning

Trouble No. 1. In equipping for oil the exhausts are removed from the stack and put on the outside and the oil people, to eliminate any possibility of not being able to keep steam, put in blowers; the green fireman felt that it was part of his duty to use the blower constantly. The sudden expansion and contraction did not agree with the boiler tubes, so we took the blowers out.

Trouble No. 2. The cone of our stacks were set close to the boiler heads with holes cut through for the exhaust pipe. The consequence was when we did not get perfect combustion in the fire box, the escaped gases exploded as soon as they came in contact with air at the boiler head.

We overcame this trouble by having cylinders made 18 inches in height with creases on the outside for the exhaust pipe. These cylinders were bolted to the boiler head with asbestos cardboard between to exclude all air. The old stacks were hinged to the top of these cylinders, we also put hinged dampers to the top of the stacks. These are dropped when we close down at noon and night; this keeps the air from passing through the flues and makes the contraction less rapid, in addition to keeping steam in the boiler much longer.

In connection with putting tubes in a donkey boiler, there is one point to which I wish to call your attention; there is no doubt in my mind that a large percentage of tubes are ruined by having the life rolled out of them by men who do not thoroughly understand rolling tubes. In replacing tubes in our boilers we found some of them rolled ¼ inch larger than their normal size and the edges of the head-holes had cut practically through the tubes. In replacing the tubes we made a die for our power press, one inch of which was swedged ⅛ of an inch, and swedged the tubes in this die. We then used 1-16 x ½ band iron for ferrules and used 1¼-inch expander and finished the work with a 2-inch expander. This eliminates the cut on the outside of the flue when rolled.

Comparative Cost of Coal and Oil for Fuel in Locomotives

Our logs are hauled over the Marysville & Arlington Railway with a 60-ton Shay locomotive. The distance from our camp to our dump at Marysville is twenty miles. This engine makes two trips each day making 80 miles per day. We have had a very good opportunity to compare the relative cost of coal and oil in this particular engine and find the comparison to be about as follows:

With coal, making five trips, averaging 120,000 per trip, or 600,000 feet of logs, it took fifteen tons of coal at \$4.25 per ton	\$63.75
With oil, making five trips, averaging 120,000 per trip, or 600,000 feet of logs, it took 45 barrels of oil at \$1.10 per barrel	49.50

This shows a saving in cost of \$14.25 on five trips, or \$2.85 per trip in favor of oil. But if the cost of oil was as much or more than coal, the fact that it eliminates fire risk to a large extent, is, in my opinion, a very strong factor in its favor.

In connection with our machine shop we have a foundry in our camp that we consider a very good investment. We employ a mould-

er who sets his moulds and takes one cast per week, or an average of 4,000 pounds at the following cost:

Moulder, six days at \$4.00	\$24.00
Four helpers while pouring, two hours	3.00
One-half ton coke	4.00
4,000 pounds scrap iron at \$9.00	36.00
Steam for running blower	3.00

Total cost of 4,000 pounds of castings \$70.00
or 1¾ cents per pound.

For the past two years we have made all the castings used in our camp at this price, which is about one-half of the cost prior to that time. In addition to car and locomotive casting we make stove parts, block sheaves, cylinder heads and rings; and, in fact, anything we might need. There are times when the machinist would not be busy if it were not for the foundry. When he is not busy with other work there are always castings to be bored or planed or bushings to be put into sheaves. In addition to this saving we recast our old castings; I would say off-hand, that we get 25 per cent. of our cast back to be recasted.

If we should happen to break a casting that we do not have in stock we can always get it out within a few hours. Every logger can thoroughly appreciate this advantage. In my opinion no logging camp machine shop is complete without a foundry.

• The Gasoline Donkey

About two years ago we bought a 20 h.p. Krauskoff gasoline donkey for building landings, and we consider it one of the best machine investments we have ever made. It has many advantages over a steam donkey for this purpose. It can be loaded or unloaded from the end of a car in less than half an hour; it does not set fires; it does not waste fuel when there is no work for it, as it can be stopped or started at a moment's notice. When we are building landings ahead of the steel, we do not have to worry about getting water and fuel to it. The actual run of the machine would average about five hours per day; one bucket of water and five gallons of gasoline will run it for this length of time; cost of fuel and oil about \$1.00. When the machine is not running the engineer helps the landing men, cutting skids or grading.

A 20 h.p. machine is large enough for ordinary landing building, but if one wishes to do much scraping with a 1½ yard Bagley scraper, I would advise a 40 h.p. machine with the haulback geared at the same speed as the main drum. The machine we have was made for clearing land and the haulback geared at a very high speed, to give a quick return to the main line. When we used the scraper we had to slow down the haulback by putting on a larger sprocket, as the return weight was too heavy for the speed; but even with that change we consider our machine to light for heavy scraping.

The Supreme Court of Canada has decided against the C. P. R. in its appeal against the decision of the Appellate court of British Columbia, in the case of a number of claims for damages to timber caused by forest fires, started, according to the plaintiffs by sparks from the company's locomotives. The two judgments sustain the judgment of the original court in favor of the plaintiffs.

The accompanying illustration shows a seven gauge straight ground saw of 72 in. diameter manufactured by the Radcliffe Saw Manufacturing Company, Limited, of Toronto, and now running in

A Record Making Radcliffe Rip Saw

the mill of the Chandler-Jones Lumber Company, Snow Road, Ont. This is claimed to be the biggest rip saw in use in any mill in eastern Canada.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

WANTED—Hemlock or Spruce Logs or Lumber. Apply to Box 905, Canada Lumberman, Toronto. 22-23-24-1-2

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co. Ltd., Toronto, Ont. 7-tf

Block of Hemlock

Wholesaler wants 1-in. and 2-in. Hemlock. Furnish specifications, quantity, sizes, etc. Also when cut, if trimmed and edged, and sizes sorted. Point of shipment. Quote lowest prices and terms. Box 921 Canada Lumberman, Toronto. 24

WANTED—2 inch spruce for 1914 delivery. Full thickness merchantable spruce, culls out. 2 x 5, 2 x 6, 2 x 7, 2 x 8, mostly 2 x 6 and 2 x 7, 9 feet and up, to average 16 feet long. Cash Buyer, Box F, Rutland, Vt., U.S.A. 21-24

Hemlock, pine or spruce logs wanted, 15,000 to 20,000, for immediate or later shipment. Give full particulars. Box 100, Canada Lumberman, 119 Board of Trade Building, Montreal. 21-24

Wanted to Buy

R. containing 279 acres more or less. On the property, there are a large saw mill, a small saw mill, an office, store, boarding house, sleeping compartments, stables, etc., and a number of dwellings for employees.

Terms: 10 per cent. cash at the sale and the balance within 30 days.

Further particulars and conditions of sale can be had on application to

Mills, Raney, Lucas & Hales,
86 Traders Bank, Toronto,
Vendors Solicitors.

Toronto, Dec. 10, 1913.

24

Sale by Auction of Valuable Timber Limits

Public Notice is hereby given that on Thursday, January 15th, 1914, at ten o'clock a.m., the timber limits hereinafter mentioned will be offered for sale by public auction at our offices.

License No. 110 Callieres South 17 square miles.

License No. 110 Callieres North 28½ square miles.

with saw mill equipped with machinery and 132 acres, more or less, freehold land at Port aux Quilles, St. Simeon Charlevoix County.

Conditions of sale: Ten per centum cash on adjudication, the balance payable upon transfer of the licenses, which transfers will have to be payable to the Crown Lands Department of the Province of Quebec by the purchaser, who will also pay the auction duty and will have to accept the licenses and property with any responsibility on the part of the vendor save that the licenses have been issued and are his property and to furnish titles to the freehold property, mills and machinery.

For inspection of the licenses and other particulars apply to

LARUE & TRUDEL,
Accountants,

24-1 Dominion Building,
126 St. Peter Street, Quebec.

Saw Mill Property For Sale or Rent

The following are some of its leading features: Situated near Little Current, on the Georgian Bay, on what is known as Picnic Island. Contains 37 acres of freehold property which includes the mill and more than twenty other buildings. It has been leased by the Wolverine Lumber Company during the past seven years, and their lease expires the first of January next. If they buy more limits they may likely continue the lease. In the meantime we are offering the property for sale or rent. The mill has been cutting about 20,000,000 a year on small logs and a ten-hour day. The Island is in unorganized territory and our yearly tax on it is only one cent an acre in addition to the Little Current school tax of about twenty-five dollars a year. The power consists of two engines—a 24 x 30-inch and a 20 x 20-inch cylinder. Five boilers 60-inch diameter by 16 feet long. A double cutting band, a wickes gang (36-inch) and a circular saw. Two trimmers, two edgers and good lath mill capacity. The protection against fire is probably the best on the Georgian Bay; with a fine large pump in the machine shop, and a water tank outside ninety feet high with water pipes leading to the mill and all the houses on the Island, four streams at once can be thrown on the mill. We carry \$62,000 insurance on the mill and on all the buildings, the average rate being less than four per cent. Our piling capacity consists of 2,200 feet of stone-filled docks holding about ten-million feet, and ten million more in the rear on the ground. Vessels can load at the docks to sixteen-foot drafts and be well sheltered. First-class booming room for about 15,000,000 feet of logs, 650 booms and chains. We carry boiler insurance, and the inspectors' report this year testifies that everything is in good condition. The average loss of time during the past six years is probably less than three days in the season for repairs, and the quality of the manufacture is among the very best on the Georgian Bay. To build up this property at the present time would cost at the least \$200,000, but we do not care to go back to the active work of running it, and will sell the property free of encumbrance for \$75,000 and on easy terms of payment. There is now a railroad running into Little Current which will materially increase the value of this property. If we do not sell soon, would lease it for a term of years at a reasonable rent, and will be pleased to correspond with interested parties. For further particulars apply to the undersigned.

Thos. Conlon,
44 Church Street,
St. Catharines, Ont.

24-1-2-3

For Sale

Timber limit consisting of 10,000,000 feet of Pine, Spruce, Hemlock and Hardwood, tributary to Lake Nipissing. Also sawmill and logging outfit, boom timber and chains. Good reason for selling. For particulars address Box 846, Canada Lumberman, Toronto. 19-t.f.

Saw Mill For Sale or Lease

What is known as the Picnic Island Mill at Little Current. Cutting capacity 140 M. inch lumber in 10 hours. In first class condition.

Possession can be given 1st January next. For further particulars apply to

THOMAS CONLON,
44 Church Street,
St. Catharines, Ont.

21-t.f.

Pulpwood Land

2,500 acres in one township on Lake Superior patented (freehold land) for sale cheap. This is a good opportunity for an operator or anyone wishing to go into the pulpwood business to secure a fine block of timber at a very low price and receive the highest price for their wood, viz.: \$7 to \$7.50 per cord for rough unpeeled over rail of boat. 5,000 acres in different townships, 160 acre lots patented (freehold land) for sale cheap. For further particulars apply

MULHOLLAND & CO.,

23-t.f. McKinnon Bldg., Toronto.

Miscellaneous

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

Tenders for Pulpwood Limit

Tenders will be received by the undersigned up to and including Wednesday, the 31st of December next for the right to cut pulpwood on a certain area situated on the Metagami River in the District of Temiskaming.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the Crown dues of 40c per cord for Spruce, and 20c per cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario,—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario, for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into an agreement to carry out the conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, Ont., Sept. 17, 1913. 20-24

For Sale

Tugboat, 65 ft. over all, 14 ft. 3 in. beam, 8 ft. deep, fully equipped with winches, 10 and 20-in. compound engines, surface condensers and pumps. All connections and pipes brass and copper. Address T. N. McGrath, Tusket, N.S. 20-t.f.

Saw Guards and Carelessness

It is easy to guard a saw or a buzz planer but it isn't as easy to guard the operator against accident. For when a man won't use the machine guards which are provided, what are you going to do about it? I have tried all sorts of things, methods and make-shifts, and am about ready to give up in despair, take out a blanket policy covering all accidents which may occur in the shop, and let them cut hands and slice off fingers, right and left, as much as they wish. It sounds brutal to say it, but what else can be done when you get right down to the bottom of the guard business, and find that in spite of all that can be said and done, workmen (some of them at least) persist in taking risks without the guards in use?

I have tried the summary discharge plan, the fine and the premium plans, and each and all have failed, for many times the workmen simply will not use the safety devices, red tape them all you will—and can! If you want to make sure of this matter, in your own shop, just arrange a peep-hole and place a clerk there with instructions to note during the day the exact times when the saw or other tool was in operation, giving minutes and hours, and also noting in a parallel column, the position of the guard. Try this on a machine which is operated in common by several workmen, and see what a mass of evidence will be collected in support of the statements made above. And, by the way, have the clerk enter in a third column, the name of each operator against the time or times he is using the machine in question.

Just try this once or twice, and if it is not a revelation to you, then I will run any machine in your shop for a week free of charge! There are many sawguards and guards for other ma-

chines on the market, and the Patent Office Gazette shows each week from two to four more devices for the same purpose. Now, as to the patentees, before any more guards are invented, for pity's sake let somebody invent a guard or two which cannot be omitted—invent one which the workman MUST use, and the inventor will deserve the thanks and patronage of the entire wood-working fraternity. — S. P. in Wood Craft.

Veneer Machinery

THE "MERIT" LINE of Veneer Cutting, Dimensioning and Drying Machinery is designed first, for veneer mills cutting high grade furniture and commercial veneer from expensive timber, and second, for basket, crate, box and barrel factories using cheaper veneer cut from the less expensive woods.

Merit Veneer Lathe

In addition to Lathes, Clippers, and Driers, the line, includes Knife Grinders, Log Hoists and Trolleys, a set of Crate Head Machinery, a set of Barrel and Basket Hoop Machinery, Basket and Hamper Bottom Rounders, Nailing Forms, etc.

Review of Current Trade Conditions

Ontario

Ontario trade continues quiet, although for this time of year it is not exceptionally inactive. Compared with the very active trade at the end of 1912, however, the contrast is great. Travellers who have recently called upon the trade in the States bordering upon the great lakes report normal conditions and a more optimistic outlook for the future. The amount of lumber in stock at Tonawanda is about equal to what it was a year ago. It has arrived earlier this year than last year and the bulk of it is in piles in the yards now, very little being held on the docks for winter sorting. No. 3, 4 and 5 boards are exceedingly scarce and consequently are held at high prices, but the intermediate grades, with the exception of 1-in. x 4-in., No. 1 and 2 common and dressing and 1-in. x 8-in. of the same grades are long on the market. The same applies to all grades of shop lumber and fine common and better. Prices on these lines are easier, owing largely to the fact that Idaho white pine is working in on the eastern markets to a great extent. The same applies to Michigan and Ohio stocks. One feature of the United States trade is very different to the Canadian situation, namely that money can be secured at from 5 to 5½ per cent. on first mortgages, which has quite a stimulating effect on the consumption of lumber for building.

Michigan and Wisconsin producers of hemlock are invading the Canadian market to a considerable extent and unless there is a stiffening up of hemlock prices on the other side this invasion will be felt more keenly in the future even than at present. No. 1 sized hemlock is being delivered along the border and as far east as London, at \$20 per thousand. Yellow pine is also making it a difficult matter for the Canadian hemlock producer to obtain the price that he has been holding his stock at. In a great many of the yards in western Ontario, at least 75 per cent. of the stock carried at present is reported to be yellow pine.

The lath situation is strong and stocks are very scarce on the market. Shingles are stiffening up somewhat and more are being used this fall than usual, owing to the recent heavy wind storms.

The market for telephone poles today is very firm and prices are high. There appears to be a marked shortage of poles from 35 to 50 feet long. The increase in the number of rural telephone lines throughout Canada and the United States is absorbing practically all the 25 and 30 foot poles that are being produced.

The lumber trade at Ottawa continues dull, not only on account of the customary lack of demand at this time of year, but also on account of the fact that most of the firms are now busy preparing statements of their year's business and getting cleared away for the opening of the new year. Prices continue unchanged in general. Lumber operators are commencing to fear that they will have another soft winter and that the output in the Ottawa Valley will have to show a decrease.

Eastern Canada

The lumber trade at Montreal continues quiet, although some wholesalers report a moderate amount of business. Retailers have been favored with an improvement in the demand, on account of the continued mild weather. Building permits at Montreal would indicate better business, as they continue to increase. There is a better demand for ground wood pulp and the outlook is for still further improvement. Chemical pulp is moving freely, but prices are easier as stocks are large.

Business has been quiet at Quebec for some time, largely as a result of the scarcity of stocks. The demand for lumber seems to continue quite active and prices are strong. Local building operations continue active and are quite a factor in the market conditions. The square timber and deal trade with Great Britain continues in an uncertain state. Quebec merchants will be leaving for England soon, but no one seems inclined to predict the reception which they will receive. Although present conditions appear encouraging, labor, political and financial difficulties develop so rapidly in England that no one is indulging in anticipations.

The St. John, N.B., lumber market is quiet on account of the approaching close of the year. Present prices of merchantable boards 4 in. and up wide are about \$16 and stocks are light. Clear spruce boards, planks and deals are selling at \$23 to \$25 and merchantable 2 x 3 in., 4 in., and 6 in. are bringing \$16 at the mill, 2 x 8 in., 9 in. and 10 in. are bringing \$20 to \$22. Stocks of 3 in. are moderate. Lath continue steady at about \$3 on the wharf at St. John and stocks are

light. Refuse stocks are strong at from \$10 to \$12 at the mills. Shingles continue in poor demand. Logging conditions are unfavorable at present, as the woods are still soft.

The market for eastern spruce at New York is quite spotty, although some wholesalers report a slight improvement in the price situation. Yards are keeping their stocks at the lowest possible point. At Boston, the spruce market has continued quite active. Frames are steady at \$25 basis, while rush shipments in several instances have been sold at higher prices. Offerings of random are light and prices have strengthened. The demand for all kinds of boards is about equal to the available supply in shipping condition, and prices are about steady. The demand for hardwoods at New York is slow, although the aggregate business from day to day makes a fair showing. Prospective business is light. The hardwood market at Boston continues quiet with prices unchanged. Buyers of hardwood are cautious, but sellers are not making any complaints, as they have had much better business than dealers in other lines of lumber. The hemlock market at New York continues weak with prices unsettled, although the demand is still better than for other lines. At Boston, the demand for hemlock boards is unsettled and there is quite a wide range of prices. Shingle orders at Boston are few and far between and it is doubtful if more than \$3.65 for extras and \$3.40 for clears in white cedar have been obtained. Red cedars are competing strongly. A fairly active market in lath is reported at Boston with prices steady.

Great Britain

The London spot market shows a certain amount of dullness, the demand for consumption being smaller than holders of stock would like to see. Overside deliveries are quite up to the average, but those from stock are small. Deliveries at London docks for the week ending November 22nd, amounted to 4,477 standards, as compared with 4,095 standards in the corresponding week of 1912, and 4,680 standards in the corresponding week of 1911. At Churchill and Sim's recent auction sale 3 by 7 in., 13 ft., first Quebec spruce brought only £11 5s. and seconds 3 by 7 in., 12 and 13 ft., sold for £10 10s. Some dry Quebec pine 2nd, 3 by 9 in., 15 ft. and 16 ft., was sold at £21 5s., while 3 by 7 and 8 in., 10 ft. to 16 ft., brought £20 5s.

The spruce deal market at Liverpool continues very quiet. The close of the shipping season for spruce deals is at hand and the arrivals will now consist practically of small parcels from St. John, N.B., and Halifax, N.S.

At Manchester, the lumber trade shows some improvement, which is remarkable at this time of year, in face of pessimistic reports from the cotton industry. Prices show little or no change. Spruce deals are not any weaker than they were a fortnight ago. Stocks on the quays are extensive and are being handled very slowly. Imports are appreciably light, which is a matter for congratulation. The lumber trade at Glasgow shows no important change and is very quiet. Pine goods continue to move slowly. Imports consist largely of contract goods. The small loads which have come forward on consignment have seldom found buyers from the ship's side. High prices for pine are making the business more and more of a hand-to-mouth character and are encouraging the use of substitutes.

United States

Lumber trade conditions, and in fact trade conditions in general throughout the United States continue to be of a conservative nature. It is pleasant to report however, that, although most business men expect very little improvement between now and the middle of January, practically everybody is expecting that conditions will right themselves soon after that date. Present conditions are characterized by the existence of plenty of money in the country, but a stand-off disposition on the part of those who possess it. Merchants in general are extremely careful about placing orders. It is reported from many quarters that farmers are meeting their interest payments on mortgages promptly, indicating that they are in good condition financially. Although trade at present is quiet, it is generally admitted that the record for the year will compare favorably with that of 1912. The chief complaint that one hears in the lumber business comes from manufacturers and is to the effect that they are not getting enough for their lumber to give them a sufficient profit. One of the chief causes for this is the absence of railroad buying and buying on the part of big industries. The building demand has averaged up pretty well in comparison with former years. For some months now,

prices have been held down to a point where there has been practically no speculation in forward buying. The lack of a speculative market is the chief trouble in the lumber business to-day.

Yellow pine conditions continue unchanged. Buying is on a very cautious basis. There are indications however, that buyers are watching the market very closely and are ready to come in on the first sign of encouragement. Recent reports state that many of the large mills which have been running on double time are reducing their output. The trade in northern pine has slackened, in anticipation of the holiday season. In the lower grades, especially in box material, there has been a steady and good demand all the year and stocks at primary points are reported low and broken. Fair, mild weather in the north has stimulated the demand and retailers have been buying steadily for their immediate wants. A fair demand is reported in the Saginaw Valley, but in the east, trade has slackened somewhat. Slow-

er trade is also reported from North Tonawanda and Buffalo. The demand for better grades at Pittsburg is fair and prices are unchanged.

The hardwood trade is about on the same basis as usual at this time of year, with a quiet but fair demand. Southern stocks are not excessive and reports from the north are to the effect that stocks are rather scarce. Most consumers, the railroads excepted, are buying steadily and freely for their current requirements and all prices are held fairly well. There is a good demand for all kinds of oak. The hemlock output in the lake states is reported to show a surplus, with the closing of the season, with prices held steady. It is believed that next year's trade will commence with firm prices and possibly some advance on present figures. Spruce prices in the east are still about \$1 off the list and mill men and wholesalers are not looking for any immediate change.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John Market Letter—Close of a Troublesome Year

St. John, N.B., December 6th. (Special to the Canada Lumberman): The lumber market at St. John is now practically marking time. We are nearing the close of a year in which conditions arose which made it hardly possible that the manufacturers here will come through with any profit for their year's work. In fact mills which will break even will do very well. Instead of making a season of 225 days which is considered an average season, the mills have lost about 90 to 95 days out of that time, which was a very serious matter. This delay was caused by the men striking for more pay and the mills closing up, as they found it impossible to grant any more increases in wages. The mills remained idle all this time, and charges of insurance, taxes, interest, office expenses and salaries of officials were piling up just the same as if under operation. It can be readily seen that this was a severe handicap against a successful year. As to prices for all kinds of wood goods at this port, they were never better. English deals held pretty firm all the season through, especially for city cut, the prices remaining at \$16.50 to \$17.00 for especially good specifications running 50 per cent. of 8 x 3 in., 35 per cent. 9 x 3 in., 15 per cent. 11 x 3 in. with scantlings and fourths at \$2 per thousand feet less.

The Price Situation

There was a time, in the early fall, when prices for deals were reduced, but this was not felt very much at St. John as no deals were ready for offering. At the present time for merchantable spruce boards, 4 inches and up wide, \$16 is obtainable, with stocks limited. The prices on boards have advanced about 50c per M. ft. since spring. This was caused by the local demand from factories being heavy. Clear spruce boards, planks and deals are bringing, and have been bringing all season, \$23 to \$25 per M. ft., merchantable 2 x 2 in., 2 x 4 in., 2 x 6 in., has been selling at \$16 per M. ft. at the mills, and stocks of these sizes are not very plentiful, being practically all in the hands of one American concern at this port, 2 x 8 in., 2 x 9 in., and 2 x 10 in., bring about \$20 to \$22 per M. ft., according to sizes and lengths. In three-inch both English and American, the stocks are not very heavy. There is not over 15 million of English and 4 to 5 million of American three and four inch. Stocks of all kinds will now diminish rapidly, as about all the mills have finished sawing, with the exceptions of four, which are expected to finish any time, should severe weather set in. The shipments of English are not heavy, but a certain quantity of space is being filled on each steamer. The shipments to the American market are limited as this market shows no signs of regaining its losses and what stocks are here will be held until such time as this market improves. It may be said here, that the American market has been more unsatisfactory during the past season, than it has for many years. Only such stocks have been sold there to advantage as were contracted on order. For any person shipping random it was extremely hard to sell and difficult to obtain a profitable price. Laths have been one bright spot in the American market; in fact it may be said the only one, as far as St. John is concerned. Laths have held pretty steady all the season through at about \$3 on wharves at St. John. Stocks of laths are now lighter than usual for this time of year, and very few will be held over during the winter. Low grade or refuse lumber is pretty well used up and will be scarce until the mills reopen in the spring. Prices for refuse have been the best ever received here, selling at from \$10 to \$11 at the mills here.

Shingles Had a Bad Year

Cedar shingles have come through a very unsuccessful year, and if prices do not improve, the manufacturers will be forced to limit

their cut in 1914. Large stocks of extras and clears are held all over the province. Up-to-date, the removal of duty on cedar shingles has not effected the demand to any extent.

Conditions for getting logs in this section of the country are very bad, in fact have not been so bad in many years. There has been no frost up to the present and this has left the woods extremely soft, as rains have fallen heavily during all the fall. This will curtail the output of logs very much, as the combination of poor weather and poor men is very detrimental to lumbering. Men are both scarce and of a very inferior quality. Wages for axe men are running from \$30 to \$35 per month and found. The cost of logging this year will exceed last seasons. In fact it is felt that the cost of getting logs is bound to increase under present conditions.

John McCauley, of Millstream, will cut three million deals at Belisle during the winter and early spring, land his stock at or near Hatfield Point.

A. Patterson will cut 600,000 to 800,000 feet of deals at Belisle this winter.

Andrew McAdoo will cut 1,000,000 feet of deals at Kars, on the Belisle, this winter.

Messrs. Reed Bros. will cut upwards of three million during the coming winter on the Washademack and Grand Lake.

The cut of rotary sawn portable lumber will not be as heavy throughout the province during this winter as was the case last season the cause of this being that the buyers of English (portable sawn) deals did not bid over \$14 per M. ft. delivered at St. John for this stock, as compared with \$15.50 last year.

Prices of hardwood deals are very firm and \$15.50 to \$16 per M. ft. can be obtained.

The box shook trade has not been better throughout the season than it is at present and prices are firm, with a tendency to a further advance.

Ottawa Trade Letter—Business Continues Dull

Ottawa, December 8th (Special to the Canada Lumberman): Being the end of the season, there is a decided dullness in trade just now in Ottawa and district. All the firms are compiling their trade returns for the past year and preparing for even better things in the New Year. There have been no changes whatever in prices lately, nor is it likely that there will be any for a few weeks.

Gilmour and Hughson, Hull P.Q., closed down their mills last Saturday, being the last to do so. Owing to the mild weather the employees thrown out of work by the closing of the mills cannot get away to the woods. With the closing of Gilmour and Hughson's mills 500 men were thrown out of work.

R. R. Williams, of the Williams Lumber Company returned on Saturday from a three weeks' visit to New York City and other parts of New York States and reports that his visit was profitable. He says that American buyers are likely to make big purchases in the Ottawa district early in the New Year.

Lumbermen here are beginning to fear that operations in the woods may again be handicapped by a "green winter." Last year the absence of snow and ice in the woods, until very late in the season, caused a decrease in the cut. If similar conditions prevail this winter prices are likely to advance later on.

E. R. Bremner, of the lumber firm of Watson and Todd, is one of a deputation of three, appointed by the Ottawa Board of Trade, to go to Montreal this week and interview officials of the Grand Trunk and C. P. R. to find out if they still intend to cut off the cartage faci-

DRY SPRUCE BOARDS

WE have them and can ship promptly now, but cannot promise to do so later because the annual car shortage will be with us.

¶ We have the largest stock of dry Spruce boards in Canada. Our assortment is now complete, but with the volume of orders we are receiving we will be short of certain items before long. If you are going to need Spruce boards this Fall, order early and make sure of having them when you need them.

¶ When ordering get the best,—the Silk Finish kind,—from the most reliable source, from the people with the most up-to-date dressing mills, the most efficient service.

OF DRY SPRUCE IN CANADA

ties on January 1st, and if so, what accommodation is to be made for shippers. If the railways carry out their intention, Montreal, Ottawa, Toronto, Hamilton and London will be affected. The answer given to the deputation from Ottawa will determine whether the matter will be brought before the Railway Commission.

That there should be a reduction in the rates on lumber from Kenora, Ont., to all points in the west, was one of the appeals which M. K. Cowan, K.C., counsel for the governments of Alberta and Saskatchewan, made to the Railway Commission on Saturday during his argument in the western freight rates case. This case has been on the tapis since February, 1912. The present hearing will not end until towards the end of this week.

Mr. J. R. Booth, the veteran lumberman who was seriously injured two months ago is making such good progress towards recovery that he will be able to get around on crutches in a short time. For a week or two he was bothered with stomach trouble, which threatened to prove serious, but this has gone and the patient is in fairly good general health and spirits.

Trade Continues Quiet at Montreal

Montreal, December 10th (Special to the Canada Lumberman): Trade continues quiet. Here and there a moderate business is done by wholesalers, but as a rule the volume of orders is small. Some of the retailers state that the mild weather has had a favorable effect on their trade, permitting building to be carried on at a period when it has usually ceased. The building permits continue to increase, although it may be said that many of the structures are being held over until next year. For the past month, the permits totalled \$4,293,745, an increase of \$1,309,759 over November of last year. From January 1st to November 30, the value was \$25,723,867, a gain of \$9,766,586 as compared with 1912. It would thus appear as if the lumber business next year should be brisk, providing always that the money market loosens up.

The demand for ground wood-pulp is better, and the chances are in favor of a still larger business. While water conditions in New England are satisfactory, there has been an absence of rain, and if this condition continues, it is almost certain that the demand for Canadian pulp will improve.

Chemical pulp is being freely purchased, but quotations are weak, owing to the large surplus manufactured during the summer months.

Reports state that most of the news print mills are well supplied with orders at fair prices. The prospect is that, with the turn of the year, there will be a stronger market for news print as well as for ground wood and chemical pulps.

Montreal Exports for 1913 Show Decrease

Montreal, December 10 (Special to the Canada Lumberman):—Exports of lumber, from the port of Montreal, during the past season, as shown by the preliminary statement below, declined by 3,610,541 feet, which contrasts with an increase of 8,412,747 feet in 1912 over 1911. The statement does not include the shipments of railway companies, small shippers, and steamship companies, which will be published later. It will be noticed that the decrease for the past season is more than accounted for by the falling off in the exports of Mr. E. H. Lemay, whose trade to foreign ports was less by more than five million feet.

The decline this year is due to the smaller amount of birch sent abroad. White pine forms about 75 per cent. of the total lumber, and the principal shippers, Watson & Todd, have increased their exports by just over a million and a quarter feet. Following are the figures:

	1913	1912
	Feet B.M.	Feet B.M.
Watson & Todd	34,596,642	33,217,881
Robert Cox & Company	18,326,191	17,316,113
W. & J. Sharples	13,571,128	12,943,460
J. Burstall & Company	8,905,256	9,149,894
E. M. Nicholson	7,695,305	7,670,005
E. H. Lemay	3,522,941	8,857,349
Dobell, Beckett & Company	3,527,783	4,267,930
Cox, Long & Company	1,878,741	2,211,896
	92,023,987	95,634,528

Stocks of Lumber Scarce at Quebec

Quebec, December 5th; (Special to the Canada Lumberman):—There has been little going on in the wood goods market here for some time past. This is not due to lack of demand for certain classes of goods, but, to the scarcity of stock. The demand for lumber is very brisk and prices have gone away up. Still, there is little to be had at any price, and it is hard to predict when a supply sufficient to meet the demand will reach the market, as no one in the trade

will venture an opinion on the subject. There is a considerable amount of local building in progress at present owing to the open season, which adds materially to scarcity of stock.

Those engaged in the pulpwood trade are awaiting the arrival of snow to make winter roads, to move their stock from the bush to shipping points. Present appearances, however, are that it will be some time before the roads will be in the condition required.

In a few weeks the merchants engaged in the square timber and deal trade will be leaving for Europe to make contracts for the delivery of these classes of goods next year. Although the outlook is said, by some, to be good, it is too early to express any decided opinion, as conditions change rapidly in business circles on the other side of the water. These changes may occur through labor, political or financial troubles, which may spring up in the space of twenty-four hours and change the whole face of the market.

As there are to be some large works started here next spring it is likely that prices will remain strong.

North Season Concluded

Thessalon, Ont., December 5th (Special to the Canada Lumberman): The mills on the North Shore have all closed down after one of the most successful seasons in their history. The yards have about one-half of the usual amount on hand to carry over for the winter and with the exception of one lot, the lumber is sold, the purchasers leaving the lumber there on account of good yards and cheap insurance. Lumber shipping was very active during the month of November. Eddy Bros. alone shipped 3,500,000 feet last week and employed 250 men loading boats in their yard. Another fleet which was there this week wound up the water shipment for the season.

The gale on November 9th caused a serious loss to some of the limit holders. A great deal of timber was blown down in places. Some localities suffered more than others. About 20 per cent. of the timber is down. A large percentage of this will be cut this winter and the loss, while a large one, will not be as heavy as at first anticipated. The cost of getting the logs out where the timber is down will be quite a factor. It will also be the cause of some increase in the output on the north shore this season.—Algoma.

New York Trade Continues Quiet

Chase, Talbot & Company, New York, in their market letter under date of December 1st, say:—The lumber business in this district is not now, and has not been, satisfactory, this year. Credit lines are more sharply drawn in manufacturing centers in the East, as well as locally, which necessarily further curtails even the modest volume that might otherwise be experienced.

The most optimistic news item is the marvellous expansion of our foreign trade, the new tariff bill going into effect on October 4th, and the month of October showing an excess of exports over imports greater than in any other month in the history of our commerce. A proportionate decrease in imports leaves a large balance of trade with us.

Secretary McAdoo offers assurance that the proposed currency legislation cannot be regarded as the bugaboo predicted, as the transition from the old to the new system is to be by a graduated method, covering a period of thirty-six months, and if necessary, the Treasury Department will lend its aid, that business and banking conditions may not be at all disturbed.

Quotations on all classes of lumber remain unchanged, with continued light volume.

Barbados Market Report

S. P. Musson, Son & Company, Barbados, in their market report under date of November 21st, report as follows:—Lumberstuffs.—White pine—The market is heavily stocked at present, and we note the arrival of the "John Parker" from Tangier, N.S., with 122 M. ft. and the "C. M. Wambach" from Ingraham Port with 148 M. ft., and the "G. M. Cochrane" from Liverpool, N.S., with 240 M. ft. These cargoes had been previously contracted for at \$34 and \$33.50 for merchantable, and \$26 and \$25 for second quality. The Schr. "Orleans" from Portland, Me., has also brought 150 M. ft. New York white pine, which has been sold at \$32 round. We understand there are some four other cargoes expected, and when these arrive the market will be stocked for some time to come. Spruce—The "Rosalie Belliveau" has arrived at our address with 232 M. ft. which had been placed to arrive some time before. Shingles—The Schr. "T. N. Rafuse" has arrived from Campbellton with 2,500,000 cedar laying which were sold at \$2.55 for extra No. 1's., and \$2 No. 1's. In Long Gaspé the Schr. "Oregon" from La Have brought 570 M., and these were sold at \$6. Wood hoops—We note the arrival of 800 bundles by London steamer for dealers account. Shooks—The Schrs. "Stanley M. Seaman" and "Orleans" have arrived from Boston and Portland with 10,465 and 10,708 bundles respectively.

THEIR ORIGIN, VALUE AND
USE—COMMENT AND VIEWS
ON AN IMPORTANT BRANCH
OF THE TRADE.

Practical Points in Selecting Face Veneer

By T. Morgan

There are many problems in connection with the proper selection of face veneer. Some of these are physical problems that have to do with the practical application of veneering, using it in making up the work, while others are matters of relative value in the appearance of the finished product.

Here is one, for example, that some one springs every once in a while. Why is it that oak either sliced or rotary-cut has a right and a wrong side and may not be used with the wrong side up, when mahogany and Circassian walnut are often reversed in the process of matching up into figures? Why is it that a man wanting to reverse and match up quartered oak is told that he must have sawed stock instead of cut stock, while in matching up mahogany and walnut he may do it from cut stock without question?

Hardness of Oak Structure

The main answer to this is that the quartered oak has a series of peculiar hard films running through it which make the splash line figure. These are so hard that no cutting knife will split them continuously. The knife either digs above or below them in the process of cutting. The result is that the grain is slightly ruptured and uneven and in the final drying out this hard film making the splash line will show flakes somewhat like raised grain.

Now and then some man with a new equipment makes the claim that he can cut quartered oak as well as it can be sawed, and we are undoubtedly making improvements and doing better work in slicing oak than ever before, but no man has ever yet produced sliced oak which was as firm as sawed oak or that could be reversed in matching up figures and give the same satisfaction. Some day we may come to this as the oak gets scarce and more valuable. This will have one influence, and another will be that we will probably learn how, by using it in very thin sheets, to glue this sliced veneer down so thoroughly that it will not flake up after finishing no matter if the grain has been disturbed a little in cutting.

Another reason that practice is not followed in connection with mahogany and walnut is that these woods have not that hard film of quartered oak and they cut better. There is some disturbance of the fibers in cutting, but it seems to be more evenly distributed and to be easier held in place with glue; therefore it is easier to cut these woods and handle them with both the right and the wrong side out in matching up and get satisfactory results than it is with oak.

A reason entering here is that of the comparative high price of the finely figured wood. There is some sawed mahogany even in fairly figured stock, and some sawed walnut. Also there is sawed figured gum as well as sliced. When it comes to the extra fine figured and valuable wood, though, in mahogany and walnut it is seldom sawed. The reason is that over half the finely figured product would go into sawdust with the very best of saws and finely figured wood is too valuable to permit this.

Expense of a Sawdust Pile

In discussing this subject recently, an experienced manufacturer who uses quite a range of figured woods said that there is little really fine mahogany sawed, and practically no finely figured Circassian walnut. "Take stock," he said, "selling from five to seven cents per square foot, and you can easily figure how any man could soon put a fortune into the sawdust pile. Usually more goes into sawdust than the thickness of fine face veneer, but take it in round numbers and for every thousand feet, surface measure, of veneer produced there would be from \$60 to \$70 going into sawdust. In other words, the sawdust pile would equal in value the veneer pile, and there is no man going to waste valuable figured wood in any such way."

We are, therefore, confronted by this anomaly in the matter of fine face veneer—the sawing being admittedly the best process for working veneer, yet the very finest and most valuable face veneer is practically always cut stock.

In the selection of face veneer the widest range of values is found in mahogany, and it is here that it takes experience to teach a man values. Without experience it is pretty hard for a man selecting face veneer to know whether or not he is getting his money's worth or getting a bargain for his money. In the furniture trade the usual range of mahogany face veneer values is from about two cents a foot up to five cents, with more of it running to two, three and four cents. Then there is other face veneer in mahogany running from five cents on up to 12½ cents per square foot. Just to complicate the matter, too, there is sometimes found figure in short lengths of mahogany

that will sell for five or six cents which if it were in longer lengths and broader sheets the seller would want from 10 to 12½ cents for it.

Beginning with plain mahogany, which has a fairly uniform and stable value the country over, there are various figures that are found with enough frequency to be practically standardized, which also have a fairly well fixed value. Aside from these, though, the selection of mahogany and establishing of values is one that calls for experience and a natural talent for judging figures and their possible appealing qualities to the public after being finished.

Piano people usually get the bulk of the finely figured, expensive mahogany, but others are bidding for this much more than they used to. Planing mills making fine woodwork in which is involved the use of figured panels go after some of this fancy stock and the furniture manufacturers are giving more attention to it, too. The indications are that we are entering an era of discrimination in regard to mahogany in which knack and knowledge of values in selecting face veneer will be a great factor in making profits for the manufacturer who puts up the work.

Circassian walnut is a wood that often ranges much higher in price than mahogany, and yet there is walnut that is really not worth nearly as much as some of the mahogany. The government statistics on imported cabinet woods gives as the average value of mahogany logs imported last year \$71.73 per thousand, while the average value given for walnut is \$120.64. That is a little less than double value for the walnut which is mainly figured wood, whereas lots of the mahogany is plain.

This Circassian comes in the form of short, ragged logs that in the process of working up and trimming to size to match up into fantastic figures involves lots of waste so that when the finished face veneer is produced the average value of the figured Circassian is often three or four times the average value of mahogany. That is one thing that makes the seemingly wide range of difference between buying Circassian veneer straight as it comes from the log and buying faces or panels trimmed and matched up into specific dimensions.

There are some manufacturers of veneer who make it a part of their business to trim, tape and match up veneer for specified size panels and other face work. Naturally, when they add to the original price of the veneer the cost of doing this work and then the waste involved it makes these look like high in price. It is often cheaper, though, for the user of a limited quantity of this kind of stock to pay the price and buy just what he needs matched up.

Getting back again to the matter of cut and sawed stock, we have touched so far mainly what is called sliced stock as compared to sawed stock. There are three methods in general use for producing face veneer—sawing, slicing, and rotary-cutting or peeling the sheets from the logs as they revolve in the veneer lathe. The great bulk of the rotary-cut stock is used for backs, fillers, drawer bottoms and plain panels, and in the packing trade. It does enter, though, into the face veneer business, and quite extensively, too.

Indeed there are certain woods that are best manufactured into veneer by the rotary process. Bird's-eye maple is a notable example of this. Yellow pine is another wood which presents its best figure in rotary-cutting. Oak also presents beautiful figure from certain blocks in rotary-cutting and sometimes it is easy to produce better stock, or rather to make a better job of the cutting of plain oak on the rotary than with quartered oak on the slices.

The rotary machine doesn't have to split that splash line film; it cuts across it and gets its figure by the irregular crossing of the line of cut of the annual rings of growth. These cause hard and soft spots in the wood, but with a good rotary machine and with the stock properly prepared can produce an excellent article.

Gum and birch are among the woods quite extensively used for rotary face stock perhaps with more birch than anything else in the North and more gum used in this way than any other wood in the South. Gum has an excellent texture for cutting; it cuts smooth and takes a splendid finish, though it is not always so easy to hold with glue as some other woods. We are just getting to the period where gum is being properly appreciated for face work and in the future is likely to be valued much more than it has been in the past.

Quite a lot of mahogany is cut on the rotary machine, especially what is called plain mahogany, and there is walnut, some of it cut on the rotary straight and some of it sliced with the rotary by using a stay log. Taking it all together there is quite a nice percentage of the best of our native woods used in the form of rotary-cut veneer for faces and we are likely to see much more of it in the future.

It behooves the buyer of face stock to make a study of these to

THE PIONEER MAHOGANY MILL OF CANADA

Mexican and African and Cuban Mahogany, English Oak

This is the most up-to-date Mahogany mill in America, and we are manufacturers of all kinds of fancy woods, viz., African, Cuban and Mexican Mahogany, teak, English oak, padouk, circassian, and Italian walnut, and others. Also all kinds of veneers, rotary, sliced, and sawed in all woods.

500,000 feet good dry mahogany ready to ship, all thicknesses, well manufactured and best quality wood. Send us your requirements and we will cheerfully quote.

Dominion Mahogany & Veneer Company

Montreal West, P.Q.

understand their relative values as well as their relative cost. And in keeping all the different methods of cutting in mind he should make it a point to stop and analyze matters now and then that he may not become confused over the relative values of different products because these are not always based on the method of cutting.—Wood Craft.

The Veteran Veneer Man Talks

"I see by the papers," said the veteran veneer man, "that a new veneer mill is to be started which will be equipped with four saws. I know of another which has begun the manufacture of sawed veneers, and has put in two or three saws. A company which had the misfortune to lose its mill by fire some time ago apparently has not profited by its opportunity, for it is going back in with four saws to be kept going on oak veneers. And another company which is manufacturing lumber has been attracted by the apparently easy money in veneer manufacture and has been looking around for one or two second-hand saws with which to manufacture thin stock."

"That is very interesting," remarked his visitor, "but rather pointless. What's the answer?"

"Just this," said the veneer man, taking his feet down from the table and his stogie from his mouth with a single motion. "We are getting too many saws for the veneer market to take care of. I happen to have equipment for making any kind of stock the consumer may want. We'll give him sawed stock if he wants it, slice-cut if he prefers that, or rotary veneers if they will serve his purpose. Consequently I don't believe I am prejudiced one way or the other on the subject. But I am convinced that some of us are going to find it rather hard to sell sawed veneers at a profit before very long."

"Good sliced stock has always constituted the bulk of the business in figured oak veneers. It has with us, and I suppose with other members of the trade as well. There are a certain number of consumers who appreciate the fact that sawed veneers can't be beat, and that the material is much more likely to be sound and to remain without defect during the entire period of its use than sliced stock, the fibers of which may have been ruptured in cutting, and which consequently may not give perfect satisfaction. But the difference in quality is so slight that only the top-notchers are willing to pay the considerable difference in price which is entailed by the increased cost of manufacturing sawed stock."

"With the market thus limited, and with those already in the field never having had any difficulty supplying the demand, it is a question as to how enough business is to be created to keep all these new saws busy."

"Change the subject," interposed his visitor, "have you ever found much of a demand for gum veneers for crossbanding purposes?"

"We make some gum for that purpose," replied the veneer man, "but frankly I do not believe that gum can be successfully substituted for poplar in this connection. In the first place, gum is not so easy to handle as poplar, and the chances of trouble are not desirable, even though with proper handling gum crossbanding will give satisfaction. But poplar is so easy to work with and is so thoroughly dependable that there is little question as to which is the more desirable."

"I have always had a leaning toward poplar, and while I know that it has been displaced in a good many industries in favor of gum, cypress and other cheaper woods, it has always been a question of price rather than quality. At least that is my view of the matter. But in the veneer business the difference in cost between poplar and gum crossbanding is so slight, amounting to between \$1 and \$2 a thousand, that it hardly pays to risk the experiment of using an indifferent substitute in order to save this relatively small amount."

Changing the subject, the caller asked what the manufacturer had heard about the use of veneers for wall-paper.

"The idea is an excellent one," he replied, "and I have seen some beautiful results secured in this way. The material used in this class of work is little more than paper, some of it being cut 120 to the inch. It is laid over a base of composition or other material, and takes an excellent finish. Most of the wall-paper dealers carry lines of paneling, so-called, for use by those who want to get the effect of a wood finish without going to the expense of having the entire interior trim of the real article. By the use of a cheap base of the kind I mentioned, covered with a thin face veneer, one is able to get a very attractive interior at a most reasonable price. However, the idea has not been in use long enough for final results to be stated. I don't really know whether the novelty can be said to have become a staple as yet or not, but I have heard of some veneer houses, especially those cutting mahogany on a large scale, having sold a good deal of stock to wall paper manufacturers for use in this way. G. D. C. Jr., in Hardwood Record."

Greenheart—A Long Lived Timber

A wood which outlasts iron and steel when placed in water is British Guiana greenheart. It is used in ship and dock building, trestles, bridges, shipping platforms, flooring and for all purposes involving great wear and tear. The woods of two species of West

Africa trees have been introduced into the British markets as substitutes for greenheart under the name of African greenheart, but both are inferior to the South American tree.

All the gates, piers and jetties of the Liverpool docks and practically all the lock gates of the Bridgewater canal in England are of greenheart. It furnished the material also for the fifty pairs of lock gates in the Manchester, England, ship canal. When the greenheart lock gates in the Mersey harbor at Liverpool were removed in order that the channel might be deepened and widened, the same wood was employed in building the enlarged gates and wood placed in the gates of the Canada dock in 1856 was used again in the reconstruction in 1894. The use of greenheart has been specified for sills and fenders in the lock gates of the Panama canal. Nansen's ship, the "Fram," and the Antarctic ship "Discovery" were built of greenheart. In addition to its use as timber, great quantities of the wood are made into charcoal.

Though it grows in parts of British, French and Dutch Guiana, Venezuela, Brazil, Colombia, Peru, Trinidad, Jamaica and San Domingo, it is being cut only in British Guiana, where it is found along the sea coast and water courses, seldom extending more than fifty miles inland.

Steep Hillside Logging

By H. W. Sessoms

Except in a general way it is hard to deal with this subject as each hillside presents different difficulties to be overcome. Heretofore most of us have tried the switchback system and we find this to be quite expensive, considering grades, fuel, wear and tear on equipment, as well as tying up too much steel. At our camps at Arlington we have about nine square miles of timber that lies on a hill at an elevation of about 1,200 feet above our main line. To switchback this line would tie up such a large amount of steel and necessitate such long switching that it would be very expensive; whereas, if we find some means of taking the cars straight up the hill on, say, a 30 per cent. incline and send the loaded cars down over the same grade, it would mean a great saving.

At this time we are having a hoisting and lowering device built that we believe will prove a success. We expect to make it work so successfully that there will be a great many of them in use within the next year.

The Willamette Iron & Steel Works, of Portland, are designing an engine for us to handle five carloads of logs on a 40 per cent. grade. This machine is to have drum capacity for 12,000 feet of 1½-inch line.

The balance of this device is of my own invention and consists of a heavily constructed block with three 3-foot sheaves set in triangular position. This block rests on the front end of a 32-foot car; on the rear of this car we will install a gasoline engine geared to the car axle to make it self-propelling.

At the present time we are opening up a strip of timber one mile long and a half-mile wide; the timber lying on the north, east and south of this strip is owned by other parties who hold their stumpage at a price that makes it prohibitive for us to buy. We have a road that runs along the west of this strip at 400-foot elevation, while the elevation one mile east is 1,000 feet. We are opening this timber by building a road through the entire tract regardless of grade, which varies from six to eighteen per cent. with the exception of 600 feet of 1½ per cent. At one-quarter mile intervals we are building short spurs, switchbacked on either side of this main line, the grade on these spurs being as nearly level as possible.

In operating this device the hoist engine will be set on the left side of the main line, the cable will be passed through the block on the car and made secure to a stump for a tail hold. This gives the machine double the pulling and holding power. When the friction is released on the hoist drum the weight of the block car will take the line to the bottom of the grade except where the grade is slight. Over these places the car will propel itself by starting the gasoline engine.

On the inside of curves the line will be taken care of by rollers; on the outside of curves we will use cone-shaped rollers over spool rollers. As the car goes down, the line will drop over these rollers, while on its return the height of the car will release the line automatically.

By making the block car self-propelling, we believe on short spurs we can do all the switching without the aid of a locomotive, as follows: The hoist lets off its friction, the car goes to the bottom of the incline where the empties are hooked on, the hoist then pulls them above the switch and drops them on to the spur; as soon as they reach slight grade the car pushes the empties to a siding at the donkey; the loads are then hooked onto the car, the hoist proceeds to pull them out on main line and lowers them to the bottom of the incline. In lowering the loads we intend to use a short line with eyes at 50-foot intervals and choke each load separately so they cannot couple. This short line is hooked to the head of the block; this distributes all the strain between the head of the block and the sheaves.

EDGINGS

Ontario

The Lumsden Lumber Company, Limited, has been incorporated, with head office at Ottawa, Ont.

The Baker Lumber Company, Lindsay, Ont., report that they do not intend to erect a new plant, as was reported some time ago.

Fire recently destroyed the sawmill belonging to Chas. Pedwell at Lions Head, Ont., causing a loss of \$28,000. The insurance was \$12,000.

The ratepayers of Chatham, Ont., are voting on December 15th upon a by-law for bonusing a proposed match factory which the Saginaw Match factory intend to erect, if they obtain suitable encouragement.

The Cleveland-Sarnia Saw Mills Company, Limited, Sarnia, Ont., report that they will not be making any additions to their plant this year. The company are putting in their usual stock of red and white pine.

The Thunder Bay Lumber Company (Potvin & Maurice) have secured from the Dominion Government the contract to cut 400,000 feet of hardwood timber on Christian Island, Georgian Bay, during the coming winter. The work will be done by the Indians.

Hon. Adam Beck, London, Ont., reports that he has not as yet come to any definite conclusion regarding the erection of a sawmill at Iroquois Falls, Ont. Reports had recently been published to the effect that Hon. Mr. Beck had decided to go ahead with this proposition.

J. P. Bertrand, of the Retail Department of the Pigeon River Lumber Company, Port Arthur, Ont., will shortly go into business on his own account as a retail and wholesale lumber dealer, at Port Arthur. In connection with this he will operate a small planing mill.

The Fesserton Timber Company, Limited, report that they will take out the same quantity of stock this winter as last in cooerage and lumber. They will have about 1,000,000 feet of pine, 4,000,000 feet of hemlock and 1,000,000 feet of other mixed timber which they will manufacture at Fesserton.

The Huntsville Lumber Company, Limited, Huntsville, Ont., expect to take out, during the coming winter, about the following stock:—1,500,000 feet of hemlock, 100,000 feet of pine, 600,000 feet of birch, 400,000 feet of maple, 100,000 feet of basswood, 50,000 feet of elm, 30,000 feet of elm and 100,000 feet of spruce.

Work has been commenced on the power house of the Abitibi Pulp and Paper Company at Iroquois Falls. Early in January it is expected that the building will be entirely housed in. The other buildings which comprise the plant have been completed and are all ready for receiving machinery, part of which has arrived.

The White Falls Lumber Company, Limited, has been incorporated, with a capital of \$40,000, to carry on business as lumber, wood and timber merchants and manufacturers and as general contractors, with head office at Toronto. The provisional directors include J. L. & J. Spears, lumbermen, and N. Sommerville, barrister-at-law, all of Toronto.

The John Carew Lumber Company, Limited, Lindsay, Ont., report that they are putting up an extensive addition to their sawmill and are installing a new slab-slasher and new lath machine. They may also increase the number of boilers in the plant. They expect to have a very large cut next season, consisting principally of hemlock, cedar, pine and basswood.

The Inland Pulp and Paper Company, Limited, has been incorporated, with a capital of \$200,000, to take over as a going concern the business of the Colonial Wood Products, Limited, now carried on at Thorold, Ont., for the manufacture of wood pulp, etc., with head office at Thorold. The provisional directors are G. N. Levy, A. H. Gibson, and S. W. C. Scott, barristers-at-law, all of Hamilton, Ont.

The Wolverine Cedar & Lumber Company, Sault Ste. Marie, Mich., who formerly operated the Picnic Island mill at Little Current, Ont., report that they have finished their operations at that point. They have cut the bulk of the timber at their two Spanish River townships and have not bought any more in that vicinity. Accordingly, they have practically finished their operations in Ontario. The company report that they cannot see sufficient margin between the cost of stumpage and operation, and the cost of lumber, to tempt them to make further purchases of timber.

The Hocken Lumber Company, Otter Lake Station, Ont., report that at present they do not contemplate any important changes in their mill machinery, but it is possible that they may be opening out another branch before next spring. Their cut for 1914 will be practically the same as 1913, ten million feet, principally hemlock. Their bush operations are already well advanced so that to-day they are laying off men instead of taking on more help. The prospects for their 1914 trade they report to be quite good, although they do not anticipate any boom but look forward to a good normal trade.

Chew Bros., Midland, Ont., report that they will replace their present equipment of five boilers this winter and install new ones which will comply thoroughly with government regulations and will provide better service and greater safety. In addition to this the company will be making the usual general repairs to their plant and giving it a thorough overhauling. Chew Bros' operations in the woods this winter will result in the taking out of three drafts, as compared with one which they took out last year. They estimate that from 85 to 90 per cent. of this stock will be white pine and the balance red pine and other timber.

The Wood-Mosaic Company, Inc., New Albany, Ind., who have been considering a proposition for erecting a plant at Stratford, Ont., report that their plans in this regard have been postponed for the present. The Wood-Mosaic Company, who manufacture parquetry, hardwood flooring, veneers and lumber, were unfortunate enough to lose their plant at Louisville Ky., and their plant at New Albany, Ind., this summer, by fire. Therefore they are extremely busy with rebuilding operations. They state that, as soon as they get these plants up, which will be about the first of the year, and get them in operation and running smoothly, they expect to take up the Canadian proposition.

Eastern Canada

Roberge & Giroux, pulpwood dealers, Chateau Richer, P.Q., has been registered.

L. E. Martineau & Cie, pulpwood dealers, St. Romuald, P.Q., have been registered.

The Lake Megantic, P.Q., Lumber Company have shut down their mill for the winter.

A. J. Moore & Company, lumber dealers, have been registered, with head office at Eaton, P.Q.

Bourque & Joliette, sash and door manufacturers, St. Cyrille de Wendover, P.Q., has dissolved.

Caron & Raymond, lumber dealers, and sash and door manufacturers, Montreal, P.Q., have been registered. The members are Edgar Caron and Eugene Raymond.

Tenders are being received by the secretary of the Montreal Harbor Commissioners (David Seath, 57 Common Street), until December 17th for Douglas fir timber, according to specifications which may be had from the chief engineer at 57 Common Street.

During the winter J. E. Moore's mill at South Bay, N.B., will undergo considerable alterations and improvements. Early in the spring, dredging operations will be started so as to provide better facilities for handling logs, and also to allow the mill to run later in the season.

The city council of St. John, N.B., have called for tenders for 20,000 feet of birch planking, 6 x 6 in. or 6 x 8 in. x 35 ft. (best quality and straight), and 10,000 feet of pine 6 x 8 in., not less than 20 ft. Tenders may be submitted up to December 20th and delivery is to be made at Ferry Wharf, East St. John, not later than March 15th, 1914.

J. P. Dupois, Limited, has been incorporated, with a capital of \$300,000, to carry on business as dealers in timber limits, standing timber, water powers and mill sites, and generally act as builders' merchants, etc., with head office at Verdun, Que. The provisional directors are J. P. Dupois and G. N. Monty, lumbermen; P. Morin, superintendent; J. A. Fliteau, manager, and A. Robert, accountant, all of Verdun.

The Three Villages Building Association, Limited, has been incorporated with a capital of \$50,000, to carry on business as builders, and dealers in lumber and lumber products of every description, with head office at Rock Island, P.Q. The provisional directors are A. L. Holmes, of Rock Island; W. K. Baldwin, Baldwin Mills, P.Q.; A. N. Thompson, Stanstead Plain, P.Q., and B. B. Morrill, of Rock Island.

The Ste. Agathe Lumber and Construction Company, Limited, has been incorporated, with a capital of \$300,000, to carry on business as dealers in timber limits and timber merchants, with head offices at Ste. Agathe des Monts, P.Q. The provisional directors are L. E. Parent, J. A. Pare and F. Forget, manufacturers; J. B. Reid, contractor, all of Ste. Agathe des Monts, and A. Laberge, real estate broker, of Montreal.

Western Canada

J. H. Madaugh, Vancouver, B.C., is having a shingle mill erected at Yarrow, B.C., in the Chilliwack district.

A narrow gauge railway is to be constructed by the saw mill company managed by H. T. Ross and operating at Ruby Creek, about 80 miles east of Vancouver.

The Haslam Lake Timber & Logging Company is going ahead with the construction of ten miles of logging railroad, to enable it to operate on its limits at Wulffsohn Bay, B.C., next year.

The Austin Paper Manufacturing Company, Limited, Winnipeg, Man., will commence work upon the erection of a paper mill next spring. The president of the company is R. D. Waugh, 411 Electric Railway Chambers.

The Hammond Sawmill Company, Limited, has been incorporated, with a capital of \$100,000, to deal in timber and timber licences and act as general timber merchants and contractors, with head office at Vancouver, B.C.

Foley, Welsh and Stewart, contractors for the Pacific Great Eastern Railway, are already operating one sawmill and it is reported that they may erect a second, fourteen miles north of Newport, B.C., to cut ties and bridge timber.

The India, Burma and Malay Peninsular Hardwood Lumber Manufacturing Company, Limited, has been incorporated with a capital of \$250,000, to carry on business as timber merchants, with head office at New Westminster, B.C.

The Collins Lumber Company, Limited, has been incorporated, with a capital of \$50,000, to take over the business of Collins Lumber Company, Limited, and carry on business as timber merchants, etc., with head office at New Westminster, B.C.

A. H. B. MacGowan & Company, 2285 3rd Street West, Vancouver, B.C., are considering the erection of a lumber mill and are negotiating with the government for part of Semiahmoo Indian Reserve at Semiahmoo Bay, where the proposed mill will be located.

The Western Logging Company, Limited, has been incorporated, with a capital of \$150,000, to take over the business of the U. S. Pacific Lumber and Timber Company, Limited, and carry on business as timber merchants, etc., with head office at Vancouver, B.C.

The Brooks-Scanlon Lumber Company, of Vancouver, has in view the purchase of 10 acres on the north arm of the Fraser River at Eburne, if it can get exemption from taxation. It is doubtful if the ratepayers will pass such exemption as they have declared against it in the past. In view of present conditions, though, it is not so improbable. The Brooks-Scanlon Company intend to erect a woodworking mill on the proposed site.

The Watt, Gibson Realty Company, which was recently incorporated, will open a planing mill and lumber yard in Regina, Sask., next spring. They have already secured a site at Industrial Heights, Regina. Those interested in the company are A. Watt, Toronto, president; Wm. T. Bourdeau, Chatham, Ont., vice-president; S. J. Gibson, Toronto, secretary-treasurer; directors, W. J. H. Price, Burnhamthorpe, Ont., and H. B. Death, Port Credit, Ont. The capital of the company is \$100,000.

Kent's Cordwood Splitter

1. Conveyor of logs to saw.
2. Steam hold down.
3. Cut-off saw.
4. Conveyor from saw to splitter.
5. Steam piston.

7. Steam head block.
8. Can be used as friction drive to carry wood out.
9. Vertical splitter.
10. Adjustable horizontal splitter.
11. Delivery table.

THE expensive operation of splitting cordwood has been reduced 50% in cost. Every kind of timber no matter how crooked or knotty can be easily split by the Kent Cordwood Splitter.

Cut-over limits may be turned into good profit. The splitter can be set up in the woods and while your Winter operations are in full swing—roads made and equipment running—you can send all logs unfit for lumber to the Splitter where they will be quickly made into cordwood ready for shipping.

If the splitter is used in the woods a boiler of the 35 h.p., 90 lbs. or more working pressure will supply ample power. If in the yard a 2" pipe line from boiler plant will run the Kent Cordwood Splitter.

The Correct Belt for Every Kind of Drive

Use Scandinavia

- On your main drives and on all direct drives whether straight or crossed.
- On wet drives, provided belting stays wet.
- In places where it is hot.

Scandinavia has good surface for clinging to the pulley, runs true, is flexible and enormously strong.

"Circumstances alter cases" when choosing the right belt to get longest and best service. Write us about your belting problems. We can save you money. Send to-day for copy of THE MAIN DRIVE.

Use Lanco Balata

- Where the conditions are constantly changing from wet to dry.
- Where belt must run under extremely cold conditions.
- Where you want an endless belt.

Lanco Balata will stand up under high speeds. It is impregnated with pure balata gum ensuring the highest service giving quality.

Federal Engineering Company, Limited

Montreal

GOODHUE BELTING

For

Saw and Planing Mills

In a Goodhue Belt you get only the best leather with the stretch taken out of it. A Goodhue Belt will always run evenly and "clings" to the pulley transmitting 100% of your power.

For the wet places in the mill we have a special waterproof belt—"Acme". Other Goodhue Belts are "Extra" and "Standard" recommended according to the conditions under which the belt has to run.

Goodhue Belts stretch less than any other belt by 15 to 25 per cent.

DANVILLE - QUEBEC

GET 20 PER CENT. MORE LUMBER FROM YOUR LOGS

by using our

Patent Steel Band Mill and Carriage

Results from logs of given dimensions cut on Breeze, Denison & Co. pat. band mill.

Diam.	Log Length	Feet Lum.
8 in.	16 ft.	45
10	12	54
10	16	69
11	15	96
14	16	171

This result was attained by different users of our mills during the season of 1912. We can prove to your satisfaction that this mill will cut more lumber and superior lumber than any other Band or Circular Mill on the market.

Special features of Mill

Concrete foundation not necessary. Frame constructed with brace bolted to same timbers which support base of mill. This prevents any movement of mill foundation throwing mill arbors out of cross line. Supporting timbers attached to track which prevents variation in cutting of boards.

Roller Bearing Carriage

designed to do away with lost side motion which is quite necessary for successful work in double cutting bands.

Double Action Friction Set Works

working on thin steel disc, which can be successfully used in place of usual foot friction in receding knees. This cuts down weight in pinion shaft, therefore reducing momentum, so that it is beyond speed of setter to over set by rapid work. Carriage can be changed from high to low speed instantly and can be operated without passing saw more than six inches either way. Knee opening to 44 inches. Guide prevents any binding motion to the gip and will automatically raise when coming in contact with knot in timber. Guides adjustable when mill is running.

A Canadian Built Mill of superior manufacture.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

Locomotive Boiler on Skids

Why Atkins Saws Run Faster

There is a real reason why Atkins Sterling Cross-Cut Saws will run easier and cut faster than any other Saw. This reason is because they are **Segment Ground**. This is an exclusive patented process which consists of grinding the Saws the same thickness along their entire tooth edge and gradually tapering them throughout the entire blade toward the centre on the back. See illustration in lower right hand corner.

ATKINS STERLING SAWS

will actually run with less set than any other because the blades clear themselves. There are other reasons why you should use them. Write to us at either address below and we'll tell you all about it. Better still—send us a small order and prove to your own satisfaction that Atkins Sterling Saws will make money for you.

Mr. General Planing Mill Man! Here are the records that prove the **FAY-EGAN** No. 275 to be the **"LIGHTNING"** Matcher for You—

Medium weight and medium price Matcher that will do all the work in a general planing mill or factory — **FAY-EGAN** **"LIGHTNING" No. 275**

Here is a machine that in price and power consumption is well within the means of any planing mill or factory owner.

It can be used as a Planer, Matcher, Double Surfacers, FLOORER or Inside Molder.

Inside double geared drive, all gears cut from the solid—both cylinders double belted. Round heads, thin steel knives, jointers, grinders and other modern conveniences.

The worth of a machine is best demonstrated by its deeds. Read what the 275 has done for others and will do for you.

H. E. Buck Lumber Co., Lake Charles, La., say:

"We have dressed timbers as large as 6 in. x 8 in. on your No. 275, and must say it has in every way met our approval."

Shaw Bros., of Macon, Ga., tell us:

"We work all kinds of stock from 1/2-in. ceiling to sizing timbers 16 in. x 8 in. In my 25 years' experience I have never seen its equal for the amount of work it will turn out. It has the most wonderful feed for its size and has not cost us a cent for repairs."

Rumely Products Co., Battle Creek, Mich., write:

"We use No. 275 on a variety of work, running from 1/4-in. to 1 1/2 in. soft to 3 5/8 in. x 10 1/2 in. oak and 4 1/2 in. 6 3/4 in. hickory, planing all stock four sides, sometimes taking a 1/2-in. cut with the side heads on oak 3 5/8-in. thick. A large part of our work is planing and matching circular tank staves 1 1/4 in. x 4 in. Machine has greater capacity than our men. We are entirely satisfied."

W. B. Gettys Lumber Co., Zebulon, N. C.

"Actual book records show we put 8,100,630 feet of roofers averaging 1 in. x 7 in. through a No. 275-24-in. Matcher in 1911."

Get a No. 275 to working for you. It will be a big-paying investment — Write to-day — now — for Bulletin No. 8-C and price

DISSTON Circular Saws

Are Made for Every Requirement

There is no purpose for which a circular saw is, or can be used, that an appropriate saw cannot be obtained bearing the Disston Brand.

Our long experience, and wide knowledge of the requirements of any kind of saw, enable us to produce a saw to perfectly meet the demands made upon it.

The foundation of every Disston Saw is Disston Crucible Steel. This wonderful steel is the result of long experience, covering a period of nearly three-quarters of a century in saw making and over half a century in steel making. Numerous attempts have proved that Disston Saw Steel is impossible of duplication outside of the Disston plant.

Have you a copy of our Lumberman's Handbook? It is the greatest authority on the use and care of saws. Free to Lumbermen.

The Pearl City Veneer Company, Jamestown, N.Y., report prices of veneers as follows: 1/30-in. maple, \$3.75 per M. feet; 1/24-in. maple, \$4.00 per M. feet; 1/20-in. maple, \$4.25 per M. feet; 3/16-in. 3-ply maple, sanded one side, 3 1/2 c. per ft.; 1/4-in. 3-ply maple, sanded one side 4c per ft. All F.O.B. Jamestown, New York.

This belt pulls 100 h.p. Note the 17-inch slack, and then note the tightener used before applying Cling-Surface.

We have already called attention to many installations where Cling-Surface has made belts do more and better work.

Here is another: When photographed this engine in the plant of J. S. Haggerty Brick Co., Detroit, Mich., was delivering 100 h.p. from a 6-ft. to a 3-ft. pulley through a 20-in. three-ply leather belt, engine speed 75 r.p.m. Center to center of pulleys 20 ft.

Since April, 1903, this belt has had good consistent Cling-Surface treatment and has given no trouble. As shown, it runs with 17 in. slack, and without slip.

Mr. Henry Malesky, the plant superintendent, says about this belt: "You will notice that the heavy tightener necessary before Cling-Surface was used is now hanging in the air, clear of the belt. It is no longer needed."

This belt like all Cling-Surface-treated belts, is giving excellent service. It is just one of hundreds of instances where Cling-Surface is saving many dollars each year simply because it relieves the belts of unnecessary initial tension and entirely eliminates slip.

Tell us your conditions and we will tell you what improvement is possible with Cling-Surface. Write for literature and ask for quotations which are f.o.b. Toronto.

Knight

Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk	3 feet by 6 feet 3 inches	Width of Carriages	33 inches
Diameter and Length Mandrel	2 3/16 by 55 inches	Trucks	7-inch wheels and 1 1/4-inch axles
Size Drive Pulley	20 by 10 inches	Length Track	32, 40, 48 or 56 feet
Feed per Revolution of Saw	0 to 3 1/4 inches	Style and Opening of Blocks	C1-36 inches
Feed Belt	4-inch Gandy	Style Mill Dogs	Pony Excelsior
Largest Diameter Saw	56 inches	Style Set Works	No. 1 Single Ratchet
Length of Carriages	12, 16, 20 or 24 feet		

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes or tightener and foundation bolts for husk.

THE KNIGHT MFG. CO., Canton, Ohio.

600 Sets Payette's

Famous Patent Mill-Dogs Sold

Why?

- Because (1) They will dog with perfect ease and safety in any class of timber.
 (2) Will dog just as easily, frozen maple or hardwoods of any description.
 (3) Will dog the last board, just as easily as they dogged the first one.
 (4) They do not tear the board or stock.
 (5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery;—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer; P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves. Five different class and style of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.

Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.

Descriptive Booklet and prices mailed free upon request.

THERE'S A BERLIN BAND FOR EVERY PURPOSE

On Berlin Band-sawing machines are improvements that cannot be bought elsewhere at any price.

And in the Berlin line of Band Rip and Resaws there's a machine especially adapted to whatever work you want to do.

For resawing cants or planks or slabs, or ripping any kind of stock there's a Berlin to do it at the lowest cost to you.

Equip your mill with Bands of one make, head mill to Ripsaw. Install machines of similar design with similar operating devices. Then any operator can work well with any Rip or Resaw in your mill without any "breaking in."

Each Berlin Band is adapted to certain work. The close-coupled resaw with short, stiff blade and powerful feed works will take all the cants dropped to it by two Band mills.

Low Production Cost

The Twin Horizontal with hopper feed, with its continuous cut, has a daily output of 45,000 board feet.

The Band Rip combines quick, accurate operating with fast feeds and lowers production cost of ripping molding, flooring and special stocks.

There's a Berlin Band working near you, under conditions similar to yours. See it in operation. Talk with the owner. Ask for his name and address.

This Band Saw catalog illustrates and describes the line complete.

Write for it Today

LOGGING LOCOMOTIVES

The locomotive illustrated was built for MacKenzie, Mann & Co., Contractors, Montreal, Canada, and represents the latest development in this type of locomotive.

It is suitable for logging contractors, quarries, mines and industrial service. It will haul 1,875 tons on level, and 160 tons on 3 per cent. grades.

Consult us when in the market for new locomotives. Let us help you select the locomotive best suited to your needs.

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works

Philadelphia, Pa., U. S. A.

HEISLER GEARED LOCOMOTIVES

Engine being operated by the Trout Creek Logging Co., Ltd. of Trout Creek, Canada

Especially adapted for heavy hauling on steep grades, sharp curves and uneven tracks. For logging, switching and pulling on main lines, mills, furnaces and industrial purposes.

Logging Locomotives

THE knowledge and experience of fifty years in locomotive designing and construction is what you get in our logging locomotives. They are specially constructed for logging operations and will stand up to the severe service in which they are expected to run.

They are as carefully designed and built as our 200 ton locomotives. Repair parts may always be obtained on the shortest notice.

May we send you specifications?

No Mountain Pass too Steep for
the Horse shod with

Red Tip Calks

Nowhere are surefooted horses more necessary than in the dangerous mountain passes and steep slippery hills encountered daily by the lumberman.

Red Tip Horseshoe Calks

here prove their value, and their cost is but a slight premium to pay as Horse Insurance.

The horse shod with Red Tip Calked Shoes is fearless and capable and can do the work required of him without danger to life or limb.

WHY you should install the **Mahony Blower** System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses $\frac{1}{2}$ less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

The Power Behind a Saw Mill

is the vital point on which successful operation depends.

The Mark

of Quality

The conditions under which a saw mill engine works are necessarily severe, and to meet these conditions the designs here shown have been developed. These engines are of few working parts—

Throttling Centre Crank Engine.

Throttling Side Crank Engine.

as simple in operation as they are solid in construction,—and they will plug along day in and day out with so little attention that it is no wonder they are favorites with busy saw mill men.

Throw Out Those Old Valves!!

Don't tolerate kicking or leaking valves on your Steam Feed. Just as sure as your valves kick, your cutting capacity is going to take a *big* drop. The Sawyer "feels" his work through his lever. A kicking valve *scares* him off his work; a leaking valve *just won't* let him do his best. Both kinds are money losers for you.

WATEROUS VERTICAL STEAM FEED VALVES

Will neither kick nor leak.

In the first place, the vertical position of this new valve allows perfect drainage into the exhaust port at the bottom. Should the connection break the valve drops of its own weight and shuts off the steam. That's a *safety* feature.

Then, the exhaust—mostly water—doesn't pass through the valve plug, but through the lower part of the valve chest. That's *why* the valve *cannot* kick.

And—*most important of all*—with the vertical valve there is no weight on the valve seat and consequently no wear and *no leakage*. It's a *real* steam conserver.

Further, the Waterous Vertical Valve is balanced to work *easy*, there is no dead steam between it and the cylinder. Just as soon as the sawyer moves his lever he gets the full "punch" of the live steam on his piston. That makes a fast, quick-acting, satisfactory feed.

If yours isn't that kind *now*, attach Waterous Vertical Valves and see what a difference they will make.

worth of mixed metals is what we market every year

PEERLESS metal is compounded specially for sawmills and is the best on the market for that purpose.

FAULTLESS metal is a high grade copper hardened alloy made for heavy duty work; sawmills and engines.

Our policy is large tonnage, perfect alloys, and absolutely fair and honest treatment of the trade.
